The AMERICANA ANNUAL 1963

FRONTISPIECE

Amid the halcyon palms of a tropic island, atomic-age weapons suddenly spawned in 1962 and brought the world to the edge of disaster. In October, aerial photographs by United States planes revealed the presence in Cuba of Soviet missile bases, such as this installation near San Cristóbal. The cold war's gravest crisis ended when the Kremlin acceded to United States demands that the weapons be withdrawn. DEPARTMENT OF DEFENSE

Foreword . . .

The year 1962, which saw the violence of war in no fewer than five areas of Africa and Asia—ranging from Algeria and the Congo to Yemen, Vietnam, and India—as well as the threat of war in other parts of both hemispheres, might well be characterized as a year of turbulence, of tension, and of crisis. It opened with world attention focused on a familiar setting in Berlin. It closed with the spotlight on a new setting—a bristling island in the once peaceful Caribbean—and in the midst of a drama which suggested that possibly the course of history was beginning to take a new and important turn.

The year will perhaps be remembered longest for the great October confrontation, when the Soviet government, bent on secret expansion into the Western Hemisphere, was stopped short in the face of overwhelming nuclear power and the defiant determination of free people to defend their homeland against aggression, and was forced to retreat in humility and in full view of the world. The far-reaching implications of Moscow's decision to withdraw its instruments of offensive warfare from Cuba cannot, of course, be known fully at this early date. But many observers were quick to point out that it may have represented the first real crack in the monolith of imperialistic communism—and a turning point in the cold war. In any event, it did nothing to heal the growing ideological split between Moscow and Peking, or to halt the apparent reorientation of the Communist world into two camps.

To the individual who watched with a feeling of helplessness while this hour of crisis played itself out in October, the thing that mattered most was the sudden, chilling realization that the fate of all mankind could come to rest in the hands of just two men—or, indeed, of a single man—and that the annihilation of man and his world in one vast nuclear holocaust might conceivably be no more than a scant half-hour away.

The record of any memorable year, however, is not without its bright spots, and 1962 had its share of them, particularly in the field of science. The ever-accelerating conquest of space was highlighted by the first orbital flights of American astronauts Glenn, Carpenter, and Schirra; by the "twin" flights of Soviet cosmonauts Nikolayev and Popovich; and by the remarkable interplanetary voyage of an instrumented spacecraft named Mariner II, which gave man his first close-up "look" at another planet as it sped past Venus in mid-December. Advances in heart surgery, in cancer and virus research, in deciphering the genetic code, and other discoveries in the physical and biological sciences, though somewhat less spectacular, were hardly less important.

The belief that so complex and exciting a story as that of 1962 is worth preserving in some detail for reference in the years to come has inspired the compilation of this 41st edition of The Americana Annual. To all the countless individuals who will look to this book for a fact or a detailed review, as well as to the thousands of men and women who have shared the experience of writing, editing, and manufacturing the volume, the editor wishes to express his most sincere thanks.

Opposite page: **Mercury capsule containing Lt. Col. John H. Glenn, Jr., is lifted atop an Atlas rocket at Cape Canaveral, Fla., on February 20 as the first orbital flight by a United States astronaut begins. Two other Americans—astronauts M. Scott Carpenter and Walter Schirra—followed Glenn into space in 1962 as the United States stepped up its program to place an astronaut on the moon before 1970.**

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

CHRONOLOGY
the events of 1962

CHRONOLOGY . . 1962

PART 1 . . The Outstanding Dates of the Year

JANUARY

1—Western Samoa becomes independent state.
4—Organization of American States removes sanctions against Dominican Republic.
6—U.S. and Dominican Republic resume diplomatic ties.
10—Avalanche buries 16 villages in Peru, causing about 3,500 deaths.
11—President Kennedy, in State of Union message to Congress, calls for reduction of tariff barriers, expansion of welfare programs, and measures to help economy.
15—Congolese Vice Premier Antoine Gizenga is dismissed and is censured by Chamber of Deputies, following attempt by his forces to seize Stanleyville.
18—Military countercoup in Dominican Republic deposes military junta which overthrew ruling Council of State on Jan. 16; Council is reinstated and elects Rafael Bonnelly as president.
22—President Kennedy, in first Economic Report to Congress, outlines measures to increase economic growth.
29—Britain, U.S., and USSR conclude unsuccessful 39-month talks on nuclear test-ban treaty at Geneva.
30—Leaders of 20 African nations, at six-day conference in Lagos, Nigeria, agree to establish Organization of African States.
31—American foreign ministers, at end of ten-day meeting in Punta del Este, Uruguay, approve resolution to exclude Cuba from inter-American system.

FEBRUARY

3—President Kennedy orders virtual embargo by U.S. on remaining trade with Cuba.
4—Cuban Premier Fidel Castro issues Second Declaration of Havana, attacking U.S. "imperialism" and "economic aggression" against Cuba.
8—Leftists protesting terrorist acts by Secret Army Organization (OAS) clash with police in Paris; eight persons are killed.
Argentina severs diplomatic ties with Cuba.
10—Francis Gary Powers, U.S. pilot of U-2 aircraft which crashed in USSR in May 1960, is released by Soviet Union in exchange for Col. Rudolf Abel, Soviet spy convicted of espionage by U.S. in 1957.
16—British troops move into Georgetown, British Guiana, to restore order after striking demonstrators protesting new tax program clash with police.
20—Lt. Col. John H. Glenn, Jr., becomes first U.S. astronaut to make orbital flight, as he orbits earth three times in *Friendship 7* Mercury capsule.

MARCH

2—Gen. Ne Win leads army coup in Burma that deposes Premier U Nu's civilian government.
14—Disarmament conference attended by foreign ministers of 17 nations opens in Geneva, Switzerland.
18—Cease-fire agreement ending seven-year war in Algeria (effective March 19) is signed by French and Algerian rebel representatives in Évian-les-Bains, France.
Peronist parties win Argentine legislative elections.
26—U.S. Supreme Court, in historic decision, rules that distribution of seats in state legislatures is subject to constitutional scrutiny by federal courts.
28—Argentine military leaders depose President Arturo Frondizi and seize control of government.
30—President Kennedy names Deputy Attorney General Byron R. White to succeed Charles E. Whittaker as an associate justice of the U.S. Supreme Court.

APRIL

2—Syrian military officers stage countercoup and depose army leaders who overthrew government on Mar. 28.
7—Algerian provisional government is installed.
Cuban military court sentences 1,179 rebel prisoners to 30 years' imprisonment.
8—In national referendum, 90.7% of French voters approve Algerian peace settlement.
11—President Kennedy declares increase in steel prices by six major steel producers is "wholly unjustifiable" and will have inflationary effect on economy.
13—Steel companies rescind price increases announced on March 11.
20—Raoul Salan, French ex-general and commander of OAS, is seized in Algiers by French forces.
25—U.S. resumes nuclear testing by exploding nuclear device at Christmas Island test site in Pacific Ocean.
26—Ranger IV, first U.S. spacecraft to make contact with moon, hits far side of moon after 64-hour flight.
First international satellite (Ariel), carrying British equipment and launched by U.S. rockets, is fired into orbit from Cape Canaveral, Fla.
28–29—President Kennedy and Prime Minister Macmillan, at meeting in Washington, agree not to seek early summit conference.

MAY

2—India accuses Communist China of intruding on her border and of creating tensions among Asian nations.
OAS terrorists in Algeria kill 110 persons.
6—U.S. explodes first nuclear warhead to be launched by a long-range missile from a nuclear submarine.
12—Pro-Communist rebels occupy northwestern Laos and drive 2,000 government troops into Thailand.
15—President Kennedy orders 4,000 U.S. troops into Thailand as result of rebel successes in Laos.
23—Military tribunal in Paris sentences OAS leader Raoul Salan to life imprisonment.
24—U.S. astronaut Lt. Comdr. Malcolm Scott Carpenter orbits earth three times in Mercury capsule *Aurora 7*.
25—Mass influx of Chinese refugees into Hong Kong is stopped after about 60,000 refugees were returned to Communist China since May 1.
28—Heavy trading on New York Stock Exchange results in loss of stock values totaling $20.8 billion—the largest one-day drop since Oct. 28, 1929.
31—Adolf Eichmann, former Nazi official who was tried and convicted of war crimes by Israeli tribunal in 1961, is executed by hanging in Ramleh, Israel.

JUNE

3—Air France Boeing 707 crashes at Paris, France, killing 130 persons; death toll is worst single-plane disaster in aviation history.
11—Laotian leaders, meeting at Khang Khay, announce formation of 19-member coalition cabinet for Laos, headed by Prince Souvanna Phouma as premier.
17—OAS orders truce in Algeria following agreement on general amnesty for terrorists.
18—Canada's ruling Conservative Party loses parliamentary majority in national elections.
24—Prime Minister John G. Diefenbaker announces that Canada will borrow $1 billion and introduce austerity program to ease its financial difficulties.

JULY

1—Algerians vote in national referendum to approve independence for Algeria in cooperation with France.
United Nations trust territory of Ruanda-Urundi becomes independent states of Burundi and Rwanda.
3—France formally proclaims Algeria's independence.
6—Hydrogen-type nuclear device is tested underground in U.S. for first time, at Nevada test site.
9—U.S. sets off thermonuclear explosion in upper atmosphere over Johnston Island in Pacific Ocean.
10—Telstar communications satellite is launched into orbit and relays transatlantic television broadcast.
17—Senate narrowly defeats President Kennedy's program of health care for the aged under Social Security.
18—Military junta overthrows government in Peru.
20—International Court of Justice expresses advisory opinion that all United Nations members are legally obligated to pay expenses of United Nations operations in the Congo and Middle East.
23—Delegates to 14-nation conference on Laos, in Geneva, sign agreements guaranteeing Laotian independence.
31—Agreement to establish Federation of Malaysia, comprising Malaya, Singapore, and British Borneo, is signed in London.

AUGUST

5—Soviet Union resumes atmospheric nuclear testing by exploding 30-megaton device at Arctic test site.
Film star Marilyn Monroe dies, in Los Angeles.
6—Jamaica becomes independent dominion within Commonwealth of Nations.
11—Soviet astronaut Maj. Andrian G. Nikolayev, in *Vostok III* spaceship, is launched into orbit.
12—Astronaut Lt. Col. Pavel R. Popovich, in *Vostok IV*, is also orbited. Nikolayev reports sighting Popovich's spacecraft.

15—Soviet astronauts land within 6 minutes of each other in south-central USSR. Nikolayev completed 64 orbits; Popovich, 48 orbits.

Dutch-Indonesian agreement to transfer administration of West New Guinea from Netherlands to United Nations on Oct. 1, 1962, and to Indonesia on May 1, 1963, is signed in New York.

17—U.S. resumes diplomatic relations with Peru.

18—West Berliners demonstrate violently to protest murder of refugee (Aug. 17) by East German border guards.

22—Soviet Union abolishes office of Soviet commandant in East Berlin. U.S. declares action will not affect rights of Western commandants in Berlin.

27—Congress completes action on constitutional amendment outlawing poll tax in federal elections. (Proposal goes to state legislatures for ratification.)

U.S. launches Mariner II spacecraft toward Venus.

29—Associate Justice Felix Frankfurter retires from Supreme Court after 23 years' service; President Kennedy names Arthur J. Goldberg to succeed him.

31—Trinidad and Tobago attains independence within Commonwealth of Nations.

SEPTEMBER

1—Earthquake in Iran destroys 294 villages and kills 12,403 persons.

2—Soviet Union announces agreement to supply arms and technical specialists to Cuba.

4—Soviet Union protests to U.S. against flight (Aug. 31) by U-2 aircraft over Sakhalin Island in eastern USSR. U.S. replies that flight was unintentional.

4–9—French President de Gaulle pays state visit to West Germany to emphasize French-German reconciliation and to "promote" European unification.

9—Communist China announces it has shot down Chinese Nationalist U-2 aircraft over eastern China.

11—Soviet Union accuses U.S. of preparing aggression against Cuba, and warns that this would mean war.

13—President Kennedy declares U.S. military action against Cuba is not now "required or justified," but says U.S. will act if its security is imperiled.

18—United Nations General Assembly opens 17th regular session; elects Muhammad Zafrulla Khan of Pakistan as president; admits Ruanda, Burundi, Jamaica, and Trinidad and Tobago as new members.

23—Insurgent military forces in Argentina seize control of Buenos Aires from opposing army faction.

25—Gov. Ross R. Barnett of Mississippi bars admission of Negro student James H. Meredith to University of Mississippi, despite federal court order.

27—Yemeni Army deposes imam of Yemen; proclaims republic.

28—Canadian-built satellite (Alouette) is launched into polar orbit by U.S. rockets.

30—Rioting crowds battle federal marshals in Oxford, Miss., after Meredith is installed on campus of university; two persons are killed and 75 are injured. President Kennedy, in national address, declares federal government will carry out the law "with whatever means are necessary."

OCTOBER

1—About 5,000 federal troops are dispatched to Oxford, Miss., and help to quell riots, as James H. Meredith is enrolled in University of Mississippi and attends first classes.

Administration of West New Guinea is transferred from Netherlands to United Nations for seven-month interim period, pending transfer to Indonesia.

3—U.S. astronaut Walter M. Shirra, Jr., completes nearly six orbits of earth during 9-hour 14-minute space flight in Mercury capsule *Sigma 7*, landing safely in Pacific Ocean.

5—French Parliament censures government for proposal to select president by popular election, forcing resignation of Premier Georges Pompidou's cabinet.

8—United Nations admits Algeria to membership.

9—Uganda becomes independent state within Commonwealth.

11—Pope John XXIII opens 21st Ecumenical Council of 2,700 Roman Catholic prelates in Vatican City.

20—Large-scale fighting between Communist Chinese and Indian forces breaks out in disputed border areas.

22—President Kennedy announces U.S. air and naval "quarantine" of Cuba because Soviet Union has installed offensive missile and bomber bases on island.

23—Council of Organization of American States authorizes "use of armed force" to impose quarantine of Cuba. Soviet Union challenges right of U.S. to establish quarantine.

24—U.S. air and naval quarantine to prevent shipment of Soviet offensive weapons to Cuba goes into effect.

25—President Kennedy agrees to hold discussions between U.S. representatives and UN Acting Secretary General U Thant on possible negotiations over Cuban crisis. Premier Khrushchev accepts U Thant's proposals for moratorium and negotiations on Cuba.

U.S. Navy intercepts Soviet oil tanker bound for Cuba but permits vessel to proceed because it is not carrying offensive weapons.

Uganda is admitted as 110th United Nations member.

27—In reply to Khrushchev's proposals for settlement of Cuban crisis, Kennedy proposes that Soviet Union remove its offensive weapons from Cuba under United Nations supervision, and that U.S. end its quarantine of Cuba and give "assurances" against invasion.

28—Kennedy and Khrushchev agree to end Cuban crisis. Soviet Union pledges to halt construction of missile bases in Cuba and to remove weapons under United Nations supervision. U.S. agrees to end quarantine of Cuba and give "assurances" against invasion.

French voters, in national referendum, approve President de Gaulle's proposal to elect president by popular vote.

29—Indian Prime Minister Nehru asks for U.S. military aid and receives immediate favorable reply.

30–31—U Thant and Premier Castro confer in Havana, Cuba, but fail to reach agreement on United Nations inspection of Soviet missile bases in Cuba.

31—Prime Minister Nehru dismisses V. K. Krishna Menon as minister of defense, in wake of Chinese military advance, and assumes post himself.

NOVEMBER

1—Premier Castro announces Cuba's rejection of proposals for international inspection of Soviet missile sites.

USSR announces launching of spaceship Mars I toward planet Mars, from orbiting earth satellite.

2—President Kennedy announces that Soviet missile bases in Cuba "are being dismantled," but says U.S. quarantine will continue until threat to peace subsides.

4—U.S. concludes current series of high-altitude nuclear tests in Pacific area with 36th explosion.

6—U.S. voters return Democratic majorities to Congress; Republicans win several key gubernatorial elections.

7—U.S.-Soviet agreement to permit U.S. Navy to inspect missiles being removed from Cuba is announced.

Eleanor Roosevelt dies in New York City.

11—Department of Defense reports that 42 Soviet missiles have been shipped out of Cuba.

14–15—President Kennedy and Chancellor Adenauer confer in Washington on Berlin and other problems.

20—President Kennedy announces end of U.S. blockade of Cuba, as Khrushchev has agreed to withdraw Soviet jet bombers from island.

Kennedy signs executive order prohibiting racial discrimination in federally built or bought housing.

21—Communist China orders cease-fire along Indian border, and offers to withdraw troops back of "lines of actual control" that existed as of Nov. 7, 1959.

25—French candidates supporting President de Gaulle win unprecedented majority in National Assembly.

29—President Kennedy and Soviet First Deputy Premier Anastas I. Mikoyan confer in Washington, and agree to continue Soviet-U.S. talks on Cuban situation.

India and Pakistan agree to discuss settlement of their 15-year dispute over Kashmir.

30—U Thant is elected to four-year term as secretary general of United Nations.

DECEMBER

1—Indian Prime Minister Nehru rejects Communist China's proposals for cease-fire and border negotiations.

3—U.S. announces that Soviet jet bombers are being shipped out of Cuba in accordance with agreement.

9—Tanganyika becomes republic; Julius K. Nyerere is sworn in as president.

11—West German governmental crisis ends with agreement for formation of new coalition cabinet; Franz Josef Strauss is ousted as minister of defense.

12—Premier Khrushchev, in foreign policy address to Supreme Soviet, criticizes Communist China for opposing settlement of Cuban crisis.

13—U.S. orbits Relay satellite for worldwide radio, television, and telephone communications.

14—Mariner II space probe passes 21,594 miles from the planet Venus and radios data on its temperature and other conditions.

India announces beginning of massive Chinese troop withdrawal from northeastern frontier area.

15—Prime Minister Macmillan and President de Gaulle confer in Rambouillet, France; communiqué pledges continued negotiations on British entry into European Economic Community.

20—Juan Bosch is elected president of Dominican Republic.

Geneva disarmament conference adjourns.

21—President Kennedy and Prime Minister Macmillan, at end of four-day meeting in the Bahamas, announce agreement to replace Britain's projected Skybolt missiles project with U.S. Polaris missiles.

23–24—Remaining 1,113 Cuban rebels captured in invasion attempt of April 1961 return to U.S. after release by Castro regime in exchange for foods and medicines valued at $53 million.

26—Communist China announces border agreements with Mongolian People's Republic and with Pakistan.

27–29—India and Pakistan hold first round of talks on their dispute over Kashmir, at Rawalpindi, Pakistan.

28–29—UN Force in Congo seizes control of Elisabethville from Katanga armed forces after heavy fighting.

PART 2 . . Chronological Index of the Year's Events

ON the following pages are indexed the principal world events of 1962. Main subject headings are indexed in alphabetical order, while specific events under each subject heading are listed chronologically (in order of their occurrence). Articles on many of the persons, countries, organizations, and other subjects may be found in the main text of this volume.

The Chronological Index is intended primarily to aid the reader in finding the dates on which the most important events of 1962 occurred. It is, therefore, a selected list of the year's most significant events, rather than a complete list of all events under all subject headings, though it does serve also as a guide to the year's important developments in any subject, particularly in the major countries.

In many instances events have been listed under both the general subject headings and under the specific names of the events or persons concerned; for example, the 21st Ecumenical Council of the Roman Catholic Church is covered under the headings ROMAN CATHOLIC CHURCH; JOHN XXIII; and ITALY. In other instances, events concerning persons whose names are less familiar to most readers may be found under the name of the country or general subject involved. The outstanding United States diplomatic and other appointments are listed under the heading UNITED STATES. Cross references used herein refer only to headings within this Index.

ACCIDENTS AND DISASTERS

Aviation

American Airlines Boeing 707 jet crashes in Jamaica Bay, New York City; death toll of 95 is highest in U.S. history for single commercial plane, **Mar. 1**
British airliner crashes in jungle near Douala, Cameroun; all 111 aboard are killed, **Mar. 4**
Super Constellation carrying 107 persons, including 93 U.S. soldiers, is lost over West Pacific, **Mar. 16**
Colombian Air Force plane crashes in mountainous area of Colombia; 31 aboard killed, **Apr. 6**
Continental Airlines Boeing 707 crashes during storm near Centerville, Iowa; all 45 aboard killed, **May 22**
U.S. Navy Constellation crashes near Munich, Germany, killing 26 military personnel, **May 22**
Air France Boeing 707 crashes on take-off at Paris airport; death toll of 130 persons is worst single-plane disaster in aviation history, **June 3**
Air France Boeing 707 crashes at Guadeloupe in West Indies; all 113 aboard killed, **June 22**
Italian airliner crashes near Bombay; 94 die, **July 7**
United Arab Airline jet crashes near Bangkok, Thailand, , killing all 26 persons aboard, **July 19**
Canadian Pacific airliner crashes at Honolulu, Hawaii; 27 of 40 persons aboard are killed, **July 22**
Air Force jet crashes into mountain near Spokane, Wash., killing all 44 aboard, **Sept. 10**
Flying Tiger Line Super Constellation with 76 aboard ditches in Atlantic; 48 persons rescued, **Sept. 23**
South Vietnamese airliner crashes in central Vietnam; all 26 persons aboard are killed, **Nov. 10**
Brazilian airliner collides in air with private plane near São Paulo, Brazil; 27 persons killed, **Nov. 26**
Brazilian airline Boeing 707 jet smashes into hill near Lima, Peru, killing all 97 aboard, **Nov. 27**
Eastern Air Lines DC-7B crashes at New York airport; 26 of 51 persons aboard are killed, **Nov. 30**
Brazilian airliner crashes near Manaus, Brazil; all 50 aboard are killed, **Dec. 14**
French airliner crashes in Corsica, killing 28, **Dec. 29**

Earthquakes

Earthquake kills four persons in Mexico City and Acapulco; causes heavy property damage, **May 11**
Second quake kills three persons in Mexico City, **May 19**
Earthquake in central Colombia kills 40 persons, **July 30**
Quakes in southern Italy cause 20 deaths, **Aug. 21**
Earthquake jolts parts of Utah, Idaho, Wyoming, Montana, and Colorado, **Aug. 30**
Most destructive earthquake in Iran's history kills 12,403 persons and destroys 294 villages, **Sept. 1**

Fires and Explosions

Eleven miners die in coal mine explosion at Carterville, Ill., **Jan. 10**
Gas pipeline explodes near Edson, Alberta; eight workmen killed, **Jan. 16**
Coal mine explosion in Saar, Germany, results in death of 299 miners, **Feb. 7**
Explosion in lignite mine at Banovici, Yugoslavia, kills 54 miners, **Feb. 27**
Coal mine explosion at Hessen, Germany, kills 31, **Mar. 9**
Explosions and fire at munitions factory in Saint-Just d'Ardèche, France, kills 16 persons, **Apr. 9**
Twenty-one miners die in coal mine explosion at Ny-Aalesund Island, off Norwegian coast, **Nov. 5**
Explosion in coal mine near Carmichaels, Pa., traps and causes death of 37 miners, **Dec. 6**

Floods

Storm and accompanying floods hit North Sea coast of Germany; deaths total 343, **Feb. 17**
Forty-one persons die in Luzon, Philippines, as result of floods caused by heavy rains, (reported) **July 26**
Flash flood in Florencia, Colombia, kills about 100 persons, **Aug. 18**

ABRASIVES

Output of natural abrasives in the United States in 1961 declined 5% in volume and 1% in value from 1960, according to the U.S. Bureau of Mines. The value of abrasives imports rose 14%, while that of exports increased 10%.

Details of production of natural and manufactured abrasives for the years 1960 and 1961, along with import data for the same years, are shown in the following table.

ABRASIVES IN THE UNITED STATES
(In short tons, unless otherwise indicated)

Type and category	1960	1961
Natural:		
Grinding and polishing sand	1,702,088	1,729,660
Quartz (crude, crushed, and ground)	192,391	211,238
Garnet	10,522	12,057
Emery	8,169	6,180
Tripoli	57,713	54,641
Pumice (abrasive only)	11,000	13,000
Grindstones	...[1]	...[1]
Grinding pebbles	1,132	...[1]
Other silica-stone products	1,407	2,495
Manufactured:		
Silicon carbide	133,219	125,726
Aluminum oxide	195,906	136,951
Metal abrasives	112,383	109,515
Imports:		
Industrial diamonds (carats)	12,024,853[2]	13,462,739
Corundum	2,654	2,396
Emery	...	1,120
Pumice	6,556	6,907
Carbides of silicon	88,546	73,727
Aluminous abrasives	160,495	124,143

ACCIDENTS

Accidental deaths in the United States in the first eight months of 1962 totaled some 63,200, 6% higher than in the same period of 1961. All categories of accidents were involved, including motor vehicle (up 9%), home (up 5%), work (up 3%), and public nonmotor vehicle (up 1%). The increase in motor vehicle deaths indicated that if the trend continued, a record high total approaching 41,000 would be set for the year, eclipsing the previous high of 39,969 established in 1941.

In 1961, accidents claimed 91,500 lives, a decrease of 2% from 1960. On a population basis, accidents killed 50 persons out of every 100,000, a reduction of 3% from the previous year's death rate, and a record low. An additional 9,300,000 persons suffered disabling injuries in 1961.

Accidents rank fourth among leading causes of death in the United States, exceeded only by heart disease, cancer, and cerebral hemorrhage. Accidents were the leading killer of persons between 1 and 36 years of age in 1961.

The 1961 death total by class of accident included 38,000 motor vehicle, 26,500 home, 13,500 work, and 16,500 public fatalities. The latter three classes of accidents comprised primarily the following types: falls (18,400), fires and burns (6,900), drownings (6,550), railroad (2,300), firearms (2,300), poison gases (1,050), and other poisons (1,800).

Accidental death and injury cost the United

WIDE WORLD

ACCIDENTAL DEATHS IN THE U.S., 1960–62

Year	Total[1]	Motor vehicle	Public non-motor vehicle	Home	Work
1960	93,000	38,200	16,500	27,500	13,800
1961	91,500	38,000	16,500	26,500	13,500
1961 (Jan.–Aug.)	59,600	23,760	11,300	17,300	9,100
1962 (Jan.–Aug.)	63,200	25,910	11,600	18,400	9,300

[1] Duplications between motor vehicle, work and home accidents are eliminated in the "Total" column. Deaths of military personnel are assigned to motor vehicle, public nonmotor vehicle, and home accidents, according to the type of accident.

(Source: National Vital Statistics Division and National Safety Council.)

States an estimated $14.5 billion in 1961. Those costs included wage losses, medical fees, hospital expense, overhead costs of insurance, property damaged or destroyed, and production lost. It is estimated that the organized safety movement in the United States, headed by the National Safety Council, has saved more than 1 million lives since its founding in 1913.

Canada recorded 9,403 accidental deaths in 1960 (the latest year for which complete figures are available). The death rate was 52.8 per 100,000 population, a reduction of 2.4% from the 1959 rate of 54.1. Motor vehicle accidents were the main cause of accidental deaths in Canada in 1960 (3,700), followed by falls (1,571), drowning (1,180), burns (583), railroad (281), and poison gases (144).

HOWARD PYLE,
President, National Safety Council.

ADEN

Comprising a British colony and two British protectorates, Aden is located in the western half of the southern rim of the Arabian peninsula.

Political Divisions.—*Aden Colony* consists chiefly of two rocky peninsulas about 100 miles east of Bab al-Mandeb, together with Perim Island (5 square miles) in Bab al-Mandeb. Aden Colony has an area of 80 square miles and a population, according to the 1955 census, of 138,441 (1960 est., 155,000). The Kuria Muria Islands (30 square miles) and Kamaran Island (22 square miles) constitute dependencies of the colony.

Aden Protectorate is divided into Western Aden Protectorate (which nearly surrounds Aden Colony) and Eastern Aden Protectorate (67,000 square miles; est. pop., 350,000), which consists of five states, all in treaty relationships with Great Britain. The Qu'aiti state of Shihr and Mukalla and the Kathiri state of Sai'un, the best organized of the five, together are known are the Hadhramaut; the Qu'aiti sultan is the premier chief of the protectorate.

Western Aden Protectorate (45,000 square miles; est. pop., 400,000) consists of 18 states, all of which have protective treaties with Great Britain. On Feb. 11, 1959, with the approval of Britain, six of the states—the amirates of Baihan and Dhala; the sultanates of Audhali, Fadhli, and Lower Yafa'i; and the sheikdom of Upper Aulaqi—joined to form the Federation of the Arab Amirates of the South. The Lahej sultanate joined the federation later in 1959; the Lower Aulaqi sultanate, the Agrabi sheikdom, and Dathina confederation joined in 1960; and in 1962 the sultanate of Wahidi, in the Eastern Aden Protectorate, became a member. On April 6, 1962, the name was changed to the Federation of South Arabia. (See also below, *Events, 1962.*)

Government.—The British governor of Aden Colony (Sir Charles Hepburn Johnston, appointed in October 1960) is commander-in-chief of all British forces in the colony and protectorate. The governor presides over the colony's Legislative Council, which consists of 23 members (12 elected); he is aided by an Executive Council of 10 members (4 elected). The colony's Supreme Court has unlimited civil and criminal jurisdiction.

The Federation of South Arabia is governed by a Supreme Council of 7 members (with the chairmanship rotating each month) elected by a Federal Council composed of 6 representatives from each member state. The new capital, al-Ittihad, at Bir Ahmad, was completed and occupied in 1961. In the Eastern Protectorate, the Qu'aiti sultan is a constitutional ruler and has a State Council.

Control of British army, naval, and air forces in the area is centered in Aden under the command of Air Marshal Sir Charles Elsworthy, who is commander-in-chief, British Forces, Middle East.

Education and Religion.—In 1962 the colony had 35 primary schools, 16 intermediate schools, 7 secondary schools, a technical institute, and 2 teacher-training centers. Combined enrollment of the primary and intermediate schools was 10,416 in 1959. In the protectorates there were 68 primary schools (including 5 for girls) and 6 intermediate schools. The population is predominantly Muslim.

Economy.—Aden is one of the world's great bunkering ports, with 26 berths and 4 floating docks, in addition to 4 berths at Little Aden. An important transshipment point, the port received 5,972 ships with a total tonnage of 27,646,403 in 1960. British Petroleum, Ltd., operates a refinery in Aden with a capacity of 6.8 million tons annually. Pan-American Hadhramaut Oil Company, an affiliate of Standard Oil of Indiana, took over the oil concession of the subsidiary of the Iraq Petroleum Company in 1962. It agreed to grant 55% of its profits to the Kathiri and Qu'aiti states, and offered 20% local ownership of the company for a 30-year lease of a 26 million-acre tract.

Shipping and oil are the principal industries in the colony. Agriculture predominates in the protectorates; chief crops are sorghum and cotton. Total exports, 1961: $185 million ($171 million in 1960); imports, $237 million ($217 million). Chief exports are oil and petroleum products.

Events, 1962.—Two themes dominated affairs in Aden in 1962: strikes and the proposed union of Aden with the Federation of South Arabia to include possibly all 23 states of the protectorate. There was hardly a week when some group was not on strike in Aden. A massive general strike was called on July 23 as a demonstration against constitutional talks in London on the merging of Aden and the other states. Further demonstrations against the merger occurred in September.

Hassan Ali Bayumi, head of the National Unity Party, declared that under the merger plan Aden could attain economic and political stability. In Aden, however, many Yemeni persons belonging to opposition parties reacted violently against unity agitation. Bayumi petitioned for the merger to the United Nations, declaring that "the overwhelming majority of the population of Aden fully endorse the reunification of Aden with the South Arabian Federation." Unity talks proceeded as scheduled, and five basic documents of agreement were initialed in London on August 16. A draft treaty was considered in late 1962, and Aden's entry into the federation was scheduled to take place in 1963. The British government declared, however, that the merger will not affect the "unfettered operation" of British defense installations, and that there will be no change in the governor's powers or in British sovereignty over Aden.

SYDNEY N. FISHER,
Professor of History,
The Ohio State University.

ADENAUER, KONRAD

Chancellor of the Federal Republic of Germany: b. Cologne, Germany, Jan. 5, 1876.

Chancellor Adenauer in 1962 succeeded in keeping his country firmly allied with the United States and France, despite the differences between Presidents Kennedy and de Gaulle over defense policy. But at home, the aging leader's unstable coalition toppled in November after a national outcry over suppression of a news magazine, and in forming a new cabinet Adenauer was forced to dismiss his defense minister.

A law graduate, Adenauer entered politics in his native Cologne in 1906. He was elected mayor in 1917 and remained in that post until he was removed by the Nazis in 1933. After World War II he returned to politics, became leader of the Christian Democratic Union (CDU), was elected chancellor in 1949, and was reelected in 1953, 1957, and 1961.

Political unification of Europe and the entry of Great Britain into the European Economic Community (Common Market) occupied the chancellor during the first part of the year. He conferred with de Gaulle in Baden-Baden on February 15.

The two leaders then exchanged state visits—Adenauer going to France on July 2–8 and de Gaulle to Germany on September 4–9. During Adenauer's trip to France, he and de Gaulle issued a communiqué indicating their agreement on matters of defense and reunification of Germany. They said that negotiations toward the political unification of Europe should proceed before Great Britain's entry into the Common Market.

After vacillating in his attitude toward United States policies in Europe, Adenauer conferred in Bonn with U.S. Secretary of State Dean Rusk (June 22); they announced they had reached "agreement on all major issues"—a view echoed on November 14 after Adenauer's talks with President Kennedy in Washington.

The fall of the coalition cabinet was precipitated by a police raid on the magazine *Der Spiegel* early on October 25; the publisher, three editors, and a correspondent were jailed on charges of having revealed defense secrets. There was strong public resentment about police tactics, and the issue of censorship was raised. At first Adenauer stood firm against public demands for the dismissal of Defense Minister Franz Josef Strauss, who was alleged to have ordered the action. But in mid-November the five Free Democrats in the cabinet resigned over the *Der Spiegel* affair. The other 15 ministers, members of the CDU and its Bavarian affiliate, the Christian Social Union, then gave their resignations to Adenauer to allow him a free hand in forming a new cabinet. On November 27, the CDU told Adenauer it wanted his resignation by mid-1963—a demand to which he did not reply; and on the following day, the chancellor agreed that Strauss would not be in the new government.

ADVERTISING

Advertising in the United States in 1962 set a new record of $12.37 billion invested in national and local advertising media. The 1962 figure marked the first time the $12 billion point had been reached, and was 4.4% higher than the 1961 total of $11.84 billion.

Other notable developments included the first public offering of stock by an advertising agency, Papert, Koenig, Lois, Inc., of New York City; widespread use of electronic computers in advertising agency operations; and installation of an advertising trade newspaper editor as head of the American Association of Advertising Agencies (John Crichton of *Advertising Age* succeeded Frederic Gamble, who retired).

There was speculation at the beginning of 1962 that the new postal rates, which were debated in Washington during the year, would materially affect advertising. Some segments of the business were concerned about the Federal Trade Commission (q.v.) and its attempts to obtain wider power to deal with advertising; many advertising executives feared that the commission would adopt harsher tactics toward advertising. By the end of the year, however, no major repressive legislation had been adopted, and federal agencies had not significantly altered their policies toward advertising, but it appeared that new postal rates scheduled to go into effect in January 1963 would have an adverse effect on direct-mail advertising.

The increase in advertising investment between 1961 and 1962 was the most impressive since 1959, but the 4.4% increase was below the average annual increases of 5% to 6% in media rates. Thus the increase in revenue was not spectacular in terms of purchases of time and space in the various media.

Figures prepared by McCann-Erickson, Inc., for the magazine *Printers' Ink* show that revenue for every major medium except national outdoor advertising increased in 1962. Only network and spot advertising on television, however, increased more than 6% over the previous year. The television total was $1,445 million (including talent and production costs), 8% higher than in 1961. Magazines recorded $970 million, 5% higher than in 1961 (the 1961 figure was 2% lower than that for 1960). National advertising in newspapers totaled $825 million, 3% higher than the previous year. National advertising on radio (including network and spot advertisements) totaled $265 million, 4% higher than in 1961. Business newspapers also increased their advertising revenue by 4%, reaching $600 million. The national outdoor advertising revenue was $115 million, 6% lower than in 1961.

Other media used by national advertisers, including direct mail, point-of-purchase displays, and transportation advertising, accounted for a volume of $3,290 million, 2% higher than in 1961. Total investments in advertising by national advertisers were estimated at $7,510 million in 1962, 4% higher than in 1961. Investments by local advertisers were estimated at $4,860 million, an increase of 6% over 1961.

(See also MAGAZINES; NEWSPAPERS.)

CAMERON DAY,
Managing Editor, "Printers' Ink."

AERONAUTICS

The aviation industry in the United States in 1962 moved into the era of supersonic transports and revolutionary turbine-powered aircraft that will take off and land vertically and travel horizontally at high speeds. Although neither the supersonic transport designs nor the various vertical takeoff and landing (VTOL) aircraft were close to going into production, proposals in both categories were making progress.

In military aviation, the first model of the much-delayed B-70 supersonic bomber was completed at the North American Aviation plant in Los Angeles, Calif. The reconnaissance-strike aircraft, now known as the RS-70, will solve many problems of the technology of the Mach 3 supersonic transport, development of which is being directed by the Federal Aviation Agency (FAA), the National Aeronautics and Space Administration (NASA), and the Department of Defense. The president and the Department of Defense, despite pressure by Congress and military officers, were still keeping the RS-70 strictly as a development program. By the end of 1962 there had been no indication when, or if, approval would be given for any quantity production. The tri-service tactical fighter aircraft (TFX) program was delayed twice in 1962 as the Department of Defense asked for more refined proposals before General Dynamics Corp. and Grumman Aircraft Engineering Corp. were selected as prime contractors on November 24.

State of the Industry.—Some 668,900 persons were employed in the aerospace manufacturing industry at the beginning of 1962. The figure, which represents about 4.1% of the total manufacturing industry, is the lowest manpower figure for the aircraft industry since before the Korean War. The proportion of these persons working on aircraft and related products is declining within the in-

Terminal building and control tower of Dulles International Airport, Chantilly, Va., was opened to traffic at ceremonies on November 17.

FEDERAL AVIATION AGENCY

dustry as more effort is being devoted to the nation's missiles and space programs.

New labor contracts between the various unions and manufacturers were negotiated in 1962. As the negotiations reached critical stages in the summer and fall, President Kennedy appointed several aerospace boards, which recommended the establishment of union shops in factories where they were not prohibited by state legislation. Most of the companies went along with the recommendations "in the national interest," and a serious work stoppage was prevented. (See also LABOR.)

The industry was able to raise its earnings as a percentage of sales to about 1.8% in 1962, but this still was far below the national manufacturing average of 4.3%. Research and development expenses, new facilities, and other large investments necessary to stay competitive in the field contributed to the low earnings ratio.

Military Aircraft.—In the fighter-interceptor field, the major development in 1962 was the cutback in production of the Republic F-105D and a shift by the Air Force to a version of the McDonnell Aircraft F4H (first designated F-110A and later F-4C). Republic's loss of the F-105 work was somewhat offset by its selection as a major subcontractor in the F-4C program. Bomber production in 1962 was completed when the last B-52H rolled out of the Boeing Wichita plant as the year opened. The H series was far advanced over earlier B-52 models, but the end of the program definitely set a limit to the Strategic Air Command's bomber capabilities. With production of the B-70, if in any quantity at all, far in the future, the Air Force will have to do its best with its subsonic B-52's and B-47's and its smaller number of supersonic Convair B-58's. Navy aeronautics was advanced by the introduction of the new turboprop Lockheed P-3A in operational service in antisubmarine warfare (ASW). This version of the Electra commercial transport will add considerable capability to the ASW search missions which had been dependent on the long-lived P2V's, in production since the 1940's.

The Lockheed C-141 military transport program was progressing on schedule to give the military its first jet cargoliners designed specifically for the purpose. The interim order for Boeing C-135 jet transports was completed when the 45th aircraft in the series was delivered in the summer of 1962.

The Northrop N-156, a fighter version of the T-38 supersonic trainer, was selected during the year as the Military Assistance Pact (MAP) fighter to be sold to friendly nations. The N-156, which will be developed for smaller nations much as the Lockheed F-104 program was developed for North Atlantic Treaty Organization (NATO) nations, may reach a total production of about 800 aircraft. The Air Force has designated the fighter the F-5A.

Air Force.—As the Air Force in 1962 won some broadening of its space role, its aircraft force was being trimmed. Its role in the counterinsurgency forces to fight limited wars was seriously challenged by the Army, and its forced de-emphasis of bombers in favor of missiles resulted in a cutback in the number of airplanes in its inventory to about 16,200, compared with 16,905 in 1961. This decline was scheduled to continue into 1963, when its inventory will drop to about 15,500. The Air Force's share of the defense budget in 1962 dropped to 38% from 43%. Besides the B-70 and TFX programs, the Air Force's only winged development was the hypersonic X-20, or Dyna-Soar, which will be used for manned, fully controllable space flight. (See also AIR FORCE, U.S.; SPACE FLIGHT.)

Navy.—The growing submarine threat posed by the Soviet Union in 1962 was met by increased effort in antisubmarine warfare techniques by Navy. In addition to the Lockheed P-3A, other ASW acquisitions included increased numbers of Sikorsky SH-3A turbine-powered ASW helicopters and Grumman E-2A and S-2D search and tracking planes. The Navy in 1962 had some 9,300 planes of all types in inventory, compared with 8,793 in 1961. The Grumman A-6A Intruder was phased into fleet use during the year to give the sea arm greater load-carrying capability, longer range, and greater all-weather capacities. A new approach by the Navy, successfully tested in 1962, is the Groydyne Dash unmanned helicopter, designed to operate from destroyers, for search and destruction missions against hostile submarines. (See also NAVY, U.S.)

Army.—The Howze Board report on Army air mobility was the big development in Army aviation in 1962. The report, released late in the year, called for an expansion of the Army aircraft fleet from a total of 5,500 to 10,000 or more. All the aircraft would be organic parts of the Army's divisions and would be controlled by Army ground commanders. The report cited the need for rapid transportation of troops and for surveillance aircraft. The Army's immediate demands in 1962 continued to be largely for helicopters, in the absence of practical VTOL types. The Army's fleet, mostly helicopters, flew an average of 125,000 hours a month during the year. The Army was procuring four different helicopters and two fixed-wing aircraft in 1962. The Grumman OV-1 Mohawk was the Army's workhorse observation plane, and the de Havilland of Canada CV-2B Caribou was its assault transport. Bell was delivering the UH-1 turbine-powered utility helicopter, and Hiller was producing the OH-13. The Boeing-Vertol CH-47A became the Army's mainstay transport helicopter. In development by three teams during 1962 was a light observation helicopter.

VTOL, STOL.—Five vertical and short takeoff and landing (V/STOL) transport programs, including

the tri-service effort under Air Force management, were being developed by the armed services in 1962. The Defense Department had authorized parallel developments as alternatives to the tri-service design in the hope that a breakthrough might be accomplished. Five flying prototypes were being built in the tri-service project, and the other four projects were being limited to two test aircraft each.

Ling-Temco-Vought's Chance Vought Division, Ryan Aeronautical, and Hiller Aircraft were cooperating to develop the tri-service craft. The Navy's program concentrated on a ducted-propeller design for which the Bell Aerosystems Co. was selected over Douglas Aircraft after a design competition. The Army followed two concepts: the General Electric–Ryan lift-fan system and the Lockheed Hummingbird design. Both aircraft are planned to develop maximum low-level speeds of 450 knots per hour. The Army also allocated funds for development of the British Hawker P-1127 V/STOL. A fifth development, the Curtiss-Wright Model 1200, utilized tiltable propellers.

In the helicopter field, the major development of 1962 was the initiation of scheduled passenger flights with twin-turbine helicopters. In September, one of the transport helicopters, the Vertol Model 1-7-II was awarded a supplemental certificate by the FAA to make true vertical takeoffs and landings from building-top heliports. The first application was to be service by New York Airways from the heliport atop the new Pan American World Airways building in New York City, in 1963. The Sikorsky S-62 twin-turbine helicopter was in service with San Francisco and Oakland helicopter airlines on the west coast.

A military helicopter development of 1962 was the Sikorsky CH-53A, a heavy assault transport craft which will carry a capacity load of 63 troops. This aircraft uses many of the same components as the giant Sikorsky S-64 Flying Crane. Among its features are a six-bladed main rotor, twin-turbine engines, external sponsons containing self-sealing fuel tanks, a high-visibility cockpit, a high-speed cargo-handling system, a watertight hull for emergency flotation, a retractable tricycle landing gear, and a low-drag fuselage. The Navy has ordered the CH-53A for the Marine Corps.

Utility and Light Airplanes.—Two new United States companies joined the group offering executive and light aircraft for general aviation use in 1962. North American Aviation reported that it would offer an executive version of its twin-jet Sabreliner for about $750,000. William P. Lear moved his Swiss-American Aircraft Corp. from Switzerland to Wichita to offer his Lear-Jet to the United States executive market. Other executive and corporation jet aircraft offered during the year for future delivery were the Aero Commander Jet Commander and the Lockheed JetStar. Beech Aircraft revealed first details of its Model 120 twin-engine turboprop, which it expects to offer for about $500,000. This aircraft will carry six or eight passengers and a crew of two.

During the first six months of 1962 the United States executive and light aircraft industry shipped 3,526 planes valued at $72,134,000.

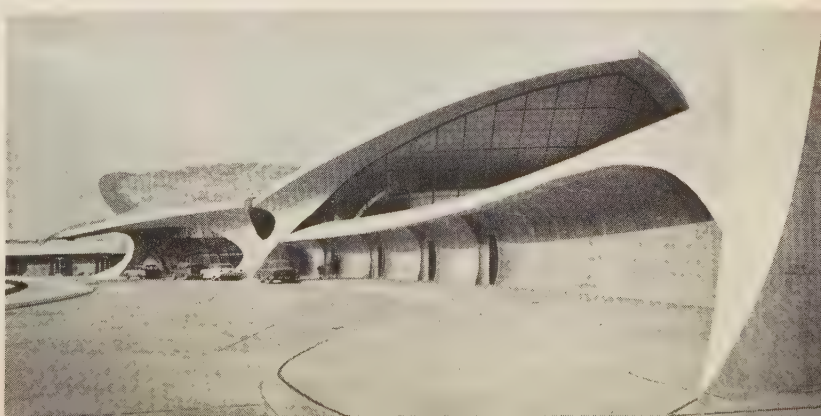
Commercial Transports.—Boeing and Douglas continued to deliver versions of their jet transports to airlines of the world. Both companies have received orders for cargo versions of their turbofan-powered 707's and DC-8's, and are continuing deliveries of the passenger versions. Boeing was proceeding rapidly with production of its Model 727 three-jet aircraft, and Douglas was considering production of a short-range twin-engine jet for the local airline markets. Convair, after suffering large losses in its commercial jet program, was completing deliveries of the 880 and 990 transports in 1962. Lockheed completed deliveries of its turboprop Electra. Fairchild Stratos Corp. was continuing production of its twin-turboprop Friendship F-27, but was having trouble finding customers with sufficient financing.

Making inroads on the American jet transport market during the year was British Aircraft Corp. with its short-range BAC-111 twin-jet aircraft. Mohawk Airlines, Bonanza Air Lines, and Braniff Airways ordered the British transport for service on short routes. Other United States short-range airlines, notably Allegheny Airlines, also expressed keen interest in the BAC-111, as did Continental Airlines, a trunk airline.

Supersonic Transport.—The FAA in 1962 awarded the first contracts for various systems to be used in a supersonic transport. There was much discussion during 1962 about whether the United States should change its development plans from an all-steel Mach 3 supersonic transport to an aluminum Mach 2.2 model, but no final decision was made. The Soviet Union reportedly was working on a supersonic transport in the Mach 1.7 to Mach 2.2 range in order to gain the prestige of being the first to develop the advanced aircraft.

Airports.—Dedication and activation by the FAA of the new Dulles International Airport at Chantilly, Va., highlighted airport development in 1962. The airport features use of the revolutionary "Mobile-Lounge," a huge bus-like vehicle that carries passengers from the airport's terminal building to aircraft parked a mile or more away. Other airport developments in 1962 included New York City's continued search for a location for a new jet airport.

The federal government in 1962 unveiled a plan to couple airport and highway development. The plan would permit construction of small airstrips along highway rights-of-way to allow communities unable to support large airports to build runways for general aviation and local service use.



Designed by Eero Saarinen, the TWA passenger terminal at New York International Airport is a concrete symbol of soaring flight.

TWA BY EZRA STOLLER ASSOCIATES

In connection with this development, the FAA adopted new light-plane airport standards, expected to at least double the number of airports in the United States over the next five years. The new standards would reduce the required width of runways and generally cut land requirements and construction costs.

Project Beacon Report.—The FAA in August 1962 disclosed its long-awaited plan for rebuilding the nation's airways by 1967 around general-purpose computers and radar data acquisition and display. The first new equipment in the system will be installed in the New York area by mid-1963, and ultimately in the 25 busiest terminal areas. The highlights of the report, which is expected to bring air traffic control to a point where it can efficiently handle all predicted air traffic in the nation, included: general-purpose computers, composite radar displays, altitude-reporting beacons, expansion of the approach-control process, terminal-area approach channeling of aircraft of varying speeds, division of controller responsibility, fewer centers, and nationwide positive area control.

HAWKER AIRCRAFT LIMITED

Rotating jet nozzles, which can be pointed straight down for takeoff, allow the British Hawker P-1127, shown here in a test flight, to rise almost vertically from a landing field. For horizontal flight, the nozzles point backward.

U.S. Commercial Air Traffic.—Traffic of United States domestic and international airlines during the first six months of 1962 was higher in all categories than during the first six months of 1961. Totals for the year were expected to be well above those for 1962, despite a damaging strike of the flight engineers against Eastern Air Lines and threatened strikes against other carriers. The most important development among the airlines was the proposed merger of American Airlines and Eastern Airlines, announced at the beginning of 1962. The plan moved through various stages of negotiation by the carriers themselves and the Civil Aeronautics Board (CAB) and other government agencies during the year.

Domestic passenger-miles flown by United States trunk airlines in the first half of 1962 totaled 15,971,858,000, compared with 14,221,263,000 in the first six months of 1961. On international flights, United States airlines flew 4,913,491,000 revenue passenger-miles in the first half of 1962, compared with 4,088,722,000 in the corresponding period of 1961.

The domestic trunk lines had a net loss of $7,556,574 in the first half of 1962, compared with a net loss of $13,586,000 in the first half of 1961. Total operating revenues were $1,125,479,656, and operating expenses were $1,095,690,047; the operating profit in the first six months of 1962 was $23,789,609, compared with $3,022,000 in the first six months of 1961, according to figures filed with the CAB.

United States international carriers reported a net profit of $6,970,000 in the first half of 1962, compared with a loss of $1,036,242 in the first half of 1961. International airlines' total operating revenues were $372,185,246, and operating expenses were $341,949,622, resulting in an operating profit of $30,235,624.

SCHEDULED TRAFFIC OF U.S. AIRLINES

	Full Year 1961	Jan.-June 1962
Domestic Trunk Airlines:		
Revenue passenger-miles	29,702,848,000	15,971,858,000
Revenue plane-miles	680,197,262	357,424,318
Freight ton-miles	384,460,102	224,620,279
Mail ton-miles	144,688,880	78,462,124
Express ton-miles	56,745,706	30,158,407
Total revenue ton-miles	3,435,218,783	1,869,492,919
U.S. Flag International Airlines:		
Revenue passenger-miles	9,554,473,000	4,913,491,000
Revenue plane-miles	163,755,055	81,774,141
Freight ton-miles*	216,759,359	126,461,291
U.S. mail ton-miles	132,930,801	74,149,636
Foreign mail ton-miles	9,087,864	4,894,727
Total revenue ton-miles	1,325,970,618	705,019,393

*Includes express ton-miles. (Source: Civil Aeronautics Board data, compiled by *Aviation Daily*.)

Canada.—The Canadian aircraft industry in 1962 faced a dearth of space and missile work, coupled with a lull in aircraft production and development. Canadair's highly promising swing-tail CL-44D cargo transport was facing a production shutdown unless the company could attract more customers. The turboprop cargoliner was performing successfully for the Flying Tiger Line, Seaboard World Airways, and Slick Airways, but no new customers were placing orders. Sales of the Canadair CL-41 jet trainer were better, however, and production of Canadair-built Lockheed CF-104G's continued throughout the year. The U.S. Army continued buying the de Havilland of Canada AC-1 Caribou as its standard assault transport.

Great Britain.—The Society of British Aircraft Constructors aircraft show at Farnborough, in September 1962, showed a variety of new British jet airliners and other transports, and several military and business planes that hold much promise. British Aircraft Corp. was working on the design of its Mach 2.2 100-seat supersonic airliner as part of its cooperative effort with Sud Aviation of France. The aircraft is slender, with a delta wing, swept-back fin and rudder, and four jet engines in pairs in two nacelles beneath the wings. Medium- and long-range versions will be offered by the BAC-Sud team. BAC was moving swiftly into the world transport market with its BAC-111; Vickers was optimistic about the potentialities of its VC-10 long-haul jet; and de Havilland's Trident and executive jet, the DH-125, were attracting much attention. In the feeder-line category, the Avro 748, although it encountered some pressurization problems, was gaining acceptance. The Handley Page Dart Herald was popular with some short-haul carriers. The British aircraft industry, mainly through its transports, in 1962 made its biggest bid for the world air transport market. Despite the intense competition from United States and French transport builders, the British effort was being felt even in the United States and France.[1]

The British also were making intense efforts to sell military aircraft, particularly to NATO members and other nations. The Hawker P-1127 VTOL fighter, given financial support by the United States and West Germany, shows much promise as a tactical support aircraft. BAC also tried to sell its TSR2 in world military markets. BAC tested the T-188 all-steel research plane which will reach the threshold of space. It is much like the United States X-15 in performance, but able to take off from the ground.

Japan.—The first large airplane designed, developed, and produced in Japan since World War II, the YS-11 turboprop, made its maiden flight in August 1962. The Japanese industry also was engaged in licensed production of various United States designed helicopters and conventional aircraft, and of United States and British engines. Among the aircraft in production in Japan are the T1, the

[1] The British Overseas Airway Corporation (BOAC), Great Britain's state-owned airline, reported on Oct. 7, 1962, that it had sustained a record loss of $40,320,000 for the year ending March 31, 1962. The loss was blamed on a decrease in transatlantic travel, the company's involved financial structure, and a strike of flight engineers in 1961.

first Japanese postwar jet aircraft; the KM-2, a development of the United States Beech Mentor trainer; the Sikorsky S-62 helicopter; the Vertol Model 107; and the Lockheed F-104.

USSR.—No major aircraft developments have come out of the Soviet Union since the memorable Moscow air show in the summer of 1961. The silence, however, did not indicate that activity was lessened. The Soviet Union apparently is strengthening its bomber fleet to increase its mobility and striking capabilities, and a major Russian aircraft effort certainly must be underway in antisubmarine warfare. The Soviet aircraft industry also is busy building fighter craft for its satellite countries, and is even trying to sell advanced MIG fighters to such nonsatellite countries as India. The USSR also is striving for improved mobility of ground troops through the development of assault transport aircraft and helicopters. The An-12, a military version of the An-10 four-engine turboprop transport, was shown in 1962. It has a rear loading ramp that permits vehicles to drive into the aircraft. Helicopters also were being outfitted with missiles and modified to carry armed troops into battle areas on short notice.

It was reported during 1962 that the fleet of Aeroflot, the Soviet airline, consisted of more than 220 turbine-powered aircraft. The big Tu-114 is in service and is capable of nonstop flights from Moscow to Havana. In the Aeroflot turbine fleet are an estimated 130 Tu-104 jets, 5 Tu-114's, 25 An-10's, and 60 Il-18's. A prototype of a new turbojet, the Tu-124A, was flown in June and was scheduled for service with Aeroflot in 1963. This aircraft has two Soloviev D-15 turbofan engines mounted on the vertical tail; the engines develop 28,600 pounds of thrust each. The Tu-124A will carry 68 to 70 passengers. Another Tupolev design has four engines mounted on the tail. This model, which is similar to the British VC-10, was expected to fly for the first time in 1963.

An important development in Russia reported during 1962 is work on developing powerful plasma (ionized gases) engines to power VTOL transport aircraft. The Russians also were reported to be working on the use of free-radical fuels for aircraft propulsion. This type of fuel was considered several years ago in the United States for use in the B-70 supersonic bomber.

(For further references, see the Index entry, *Aeronautics;* and for a summary of flight records, see the article FLIGHT RECORDS.)

WILLIAM J. O'DONNELL,
Assistant Managing Editor, "Aviation Daily."

AFGHANISTAN

Having no direct access to the sea, this Asian kingdom is surrounded by Pakistan, Iran, the USSR, and China. It has an area of about 250,000 square miles, and a population of 13,800,000 (1960 est.). Principal cities and populations: Kabul, the capital, 250,000; Kandahar, 100,000; Herat, (80,000); and Mazar-i-Sharif (50,000). More than half of the population are Pashtoons (Pushtuns, Pathans, or Pakhtuns—the so-called true Afghans); other sizable groups are the Tajiks, Uzbeks, Hazaras, and Turkomans. Persian and Pashto (Pushto) are the principal languages.

Government.—Afghanistan is a constitutional monarchy, ruled by a king (Muhammad Zahir Shah; b. 1914, acceded 1933). Parliament consists of the House of Nobles, or Senate (whose members are appointed by the king for life), and the National Assembly (whose members are elected by male suffrage for 3-year terms). Executive power is shared by the king with a council of ministers; the prime minister, Muhammad Da'ud and the foreign minister, Muhammad Na'im, are brothers and first cousins of the ruler.

Education and Religion.—School enrollment, 1961: 193,000 (about 3% of the school-age population). Number of schools (with enrollments), 1959: 803 primary (141,319); 29 secondary (7,973); 27 vocational (4,427); 1 university (1,505). About 85% of the population is illiterate. Principal religion: Islam (80% Sunnis; most of remainder, Shi'ites).

Finance.—Government expenditure, 1961–62 est.: ordinary, 2,364 million afghanis; development, 1,658 million afghanis (the afghani was valued in 1962 on the free market at about U.S.$0.0235). Foreign debt: 115,456 million afghanis in 1960; foreign exchange holdings: 1,753 million afghanis.

Transportation and Communications.—Transport networks (miles): all-weather roads, 3,170, of which about 300 are paved; no railroads; negligible river traffic. National airline: Ariana Afghan Airlines, serving chief towns and neighboring countries. Afghanistan is also served by 3 foreign airlines, using international airports at Kabul and Kandahar. Telephones number 8,000 (1962); radio sets, 63,000 (1962).

Manufactures and Minerals.—Chief industrial products (1959–60): cotton textiles, 16.4 million meters; refined sugar, 4,475 tons; coal, 41,400 metric tons; cement, 34,000; electric power, 82 million kw.-hr.; salt (1960–61), 25,900 metric tons.

Agriculture.—Agriculture is the principal economic activity of Afghanistan, with 19 million acres under cultivation. Sheep raising furnishes the chief source of income for much of the population: Chief crops (thousands of metric tons, average annual production): wheat, 2,210; corn, 696; fruits, 600; barley, 330; rice, 308; cotton, 58; sugarcane, 50; and sugar beets, 39.

Foreign Trade.—Total exports, 1959–60: 1,722 million afghanis; imports, 2,532 million afghanis. Chief exports: karakul skins, fruits, raw cotton, raw wool, and carpets. Karakul skins exported, 1961: 473,807 (326,030 in 1960). Chief imports: manufactured goods, food, machinery and equipment, and mineral fuels. Major trade partners: the USSR, India, United States, Pakistan, Great Britain, Japan, and West Germany.

Events, 1962.—Diplomatic relations with Pakistan, severed by Afghanistan in September 1961, remained strained. In January the United States obtained permission to transship to Afghanistan the material and supplies for United States aid projects which had accumulated in Peshawar and Chaman, Pakistan. In February, Iran and Afghanistan concluded a 5-year transit agreement, providing for the use of Iranian ports for Afghanistan's trade.

PARIS MATCH FROM PICTORIAL PARADE

Pierre Satre, chief engineer of Sud Aviation, holds a model of the Mach 2.2 Super Caravelle, which the French firm is developing in conjunction with British Aircraft Corp. A model of the Satre-designed Caravelle is on the table.

The agreement served to break the monopoly of the USSR as the channel for the commerce of Afghanistan with the rest of the world. At the end of July, Mohammed Riza Pahlavi, the shah of Iran, attempted to mediate the dispute between Pakistan and Afghanistan, but his efforts failed to lead to a restoration of diplomatic relations between the two countries.

In April the second 5-year plan (1962–66), calling for an expenditure of U.S.$700 million, was presented to the National Assembly. Of the proposed expenditure, one fourth is to be allocated to agriculture and irrigation, another fourth to communications, and one third for industrial development, including the construction of oil pipelines, an oil refinery, and small consumer goods factories. On June 11 it was announced that the United States rejected an Afghan request for $350 million to finance half of the development program. The United States announced that it would, however, continue to grant Afghanistan long-term economic aid.

Throughout the year both the USSR and Communist China continued to promote closer relations

with Afghanistan. Although trade between China and Afghanistan is negligible, a protocol was signed between the two countries in July, covering the exchange of goods. The USSR concluded additional agreements for Soviet economic aid, although it too failed to make a firm commitment as to the funds it would make available for the second 5-year plan. In August the king made a state visit to the USSR.

AFRICA

Africa, the second largest of the continents (area, about 11,695,000 square miles; population, some 254 million) was, as a whole, in 1962 still passing through a manifest historical phase—that of the twilight of colonialism. Not all parts of the continent were at the same stage of this process. In northeastern Africa, comprising Egypt and neighboring countries, no trace of imperial rule remained; and likewise in West Africa, centering about the Gulf of Guinea, an area where as recently as the late 1950's colonial status had been general, all states were now independent. The areas affected by change of status in 1962—or where such change of status was still a hope or a threat (depending on the point of view)—were Algeria, considerable areas in East Africa, and the whole large fraction of Africa south of the Republic of the Congo (Léopoldville).

New States of 1962.—At the beginning of the year there were 29 independent states in Africa (28 without South Africa, which the other African states regard as not one of their number). Four were added to the roster during the year. The small Belgian-administered United Nations trust territory of Ruanda-Urundi (1961 pop. est., 4,980,000) became independent on July 1 as two countries, the Republic of Rwanda and the Kingdom of Burundi. Algeria became independent of France on July 3. Uganda, a neighbor of Ruanda-Urundi, ceased to be under British rule on October 9.

Attitude of European Colonial Powers.—Many, though not all, of the events of 1962 in Africa illustrate the notable change which in recent years has overtaken the attitude of some of the European powers, especially France and Britain, toward their colonial holdings in Africa and elsewhere. Earlier they sanctioned steps toward independence with apparent reluctance, and did not take any moves in that direction until they were fully satisfied that the particular territory was reasonably well-prepared to bear new tasks in self-government. Such an attitude generally has been replaced today, in an amazing turnabout, by a determination to get rid of imperial responsibilities at the earliest possible moment.

The new typical policy of the metropolitan powers, though in harmony with the current of events, is possibly not always likely to be of greater long-term benefit to the world. Essentially, it is equally selfish. The former clinging to imperial rule was an attempt to shore up national greatness by retaining the advantages which colonies were supposed to bring in power and wealth to the mother country. Now scepticism concerning these advantages, which were possibly always illusory in the majority of cases, has been so reinforced by other factors as to produce a startling reorientation of policy.

The result is that what were once spoken and written of as sacred imperial responsibilities are now sloughed off in a manner that partakes of haste. Examples of this are very easy to find in the recent history of Africa, the greatest being that of the Belgian Congo, whose independence (effective June 30, 1960) was decided upon only six months earlier. The year 1962 also exemplifies the new pattern of imperial behavior in several ominous examples. Ruanda-Urundi was hardly, by any impartial standard, ready for independence on July 1, still less as the two separate states of Rwanda and Burundi, each too small to be viable. Even the UN General Assembly's decision of June 27 for partition and independence was evidently made with some misgivings.

Typical Problems of Areas Nearing Independence.—Two different kinds of problems were exemplified in the areas which attained independence in 1962, or which are scheduled to gain it in the very near future. With regard to both, the European powers concerned were showing themselves eager to accept anything that could pretend to be a solution, however arbitrary or temporary, provided only that it let them end their responsibilities.

One type of problem was the mutual animosities of political organizations or territorial blocs within a potentially independent state. This had been exemplified in Ruanda-Urundi. The same sort of thing was to be found in the British colony of Uganda, where there is a three-cornered rivalry among the kabaka of Buganda (the most important of the native monarchs), the other three monarchs, and the nonmonarchical remainder of the colony. These tensions remain as factors in the situation, even though independence was achieved on October 9.

In Kenya, likely to become independent early in 1963, the British government was busy in 1962 trying to patch together a working agreement between the two bitterly hostile parties, the Kenya African Democratic Union (KADU) and the Kenya African National Union (KANU), led respectively by Ronald Ngala and Jomo Kenyatta. Immensely long and difficult negotiations were conducted in London at a constitutional conference held from February 14 to April 6, and compromises on the issues dividing the parties were embodied in an agreement regarding a new constitution. An interim coalition government in which the two rival leaders are both ministers of state, and their parties divide the portfolios equally, was appointed. But this fragile compromise can hardly survive independence, for the two groups quite clearly place their partisan interests before any plans for unity, and the new constitution is as yet merely an outline.

The White Settler Dilemma.—The second type of problem is the presence in some African areas of white settlers in considerable numbers. Such settlers are, or were, to be found in French North Africa, in British East Africa, and in southern Africa, but not at all in West Africa—hence West Africa's speedier achievement of independence. In most cases they are natives of the area in which they live, and have regarded it as their permanent home. They are descended from settlers who went to Africa in most cases with the deliberate encouragement of their home governments. But, of course, they are quite outnumbered by nonwhites, though the ratio differs from one area to another. The hopes of creating "plural societies"—in which white interests would be safeguarded even after independence, and their political predominance ceded only gradually—have been in most areas irretrievably lost.

In most areas of Africa where such situations existed, the governments of the metropolitan countries were purchasing solutions by the sacrifice of

AMERICANA MAP BY DONALD T. PITCHER

the white settlers—precisely those whom until recently they always supported. The glaring example of this pattern in 1962 was Algeria, where a ceasefire was finally achieved between the French government and the National Liberation Front (FLN) on March 18, and a plebiscite on July 1 showed an overwhelming majority for independence, which came two days later. The terrorist campaign of the Secret Army Organization (OAS) was the desperate action of men who had no solution to offer, but who represented about 10 percent of the population before the wholesale emigration to France began.

In Kenya, where the rivalries of KANU and KADU were not the only problem, a situation analogous to that of Algeria was working its way toward its unsatisfactory end. The white settlers of the country could secure no assurances that in an independent Kenya their land titles would be respected, and the gestures which the British government had made toward a compensation scheme were so small that they made no real impact on the problem. As a result, in 1962 the economy of the colony teetered on the edge of disaster, and many white settlers were simply abandoning their homes.

Farther south also, in the Central African Federation (comprising Northern and Southern Rhodesia and Nyasaland), the British government seemed to be heading toward a decision at the expense of settler interests. The future existence of the federation, created in 1953, indeed was problematical. Only in Southern Rhodesia, where the whites form a little less than 10 percent of the 3.2 million population, is there a considerable white settlement; and as Northern Rhodesia and Nyasaland approached nearer to complete self-government, their leaders expressed determination to break away from the federation.

In Southern Rhodesia there was much discontent with white political dominance. In March, Prime Minister Harold Macmillan of the United Kingdom announced that a new ministry—the Central African Office—was being set up to tackle the crisis in the Rhodesias and Nyasaland. The new *ad hoc* administrative creation demonstrated the urgent need felt by the British government to deal with the situation in the federation—a political entity that in policy, as in geography, occupies a midway place between the colonies emerging to independence under Negro rule and the Republic of South Africa with its unmitigated policy of white supremacy.

Groupings and Conferences.—In 1962 there continued to be a distinct cleavage between the two groups of independent African states. Indeed, the split, which had become clear about the beginning of 1961, hardened somewhat, if anything, during the year, despite some cross-currents within the groups. Strenuous and sincere attempts have been made to build bridges between the two blocs, as for example in the meeting (Dec. 13–16, 1961) in Guinea of Sékou Touré, president of Guinea, and Sir Abubakar Tafawa Balewa, prime minister of Nigeria. Most African leaders are uncomfortable that such a breach should divide the ranks of the newly free.

The two groups are now customarily known as the "Casablanca" and "Monrovia" groups. Put very briefly, and with some oversimplification, the former is the more friendly toward the Soviet Union, the latter toward the West. The core of the Monrovia group is the 12 ex-French possessions—the "Brazzaville Twelve"—now described as *états africains d'expression française*, a tactfully noncommittal phrase which has in effect replaced

Main building of the University of Algiers is burned on June 7 as the Secret Army Organization engages in a bitter anti-independence program of terrorism.

PARIS MATCH

references to the semidefunct French Community. The Brazzaville states are, however, still on excellent terms with France and have close economic and other relations with her; their leaders are all deeply imbued with French culture, and in several cases have actually held cabinet office in governments in Paris.

The "Twelve" comprise Cameroun, Central African Republic, Chad, Congo (Brazzaville), Dahomey, Gabon, Ivory Coast, Malagasy Republic, Mauritania, Niger, Senegal, and Upper Volta. All are now overseas associates of the European Economic Community (EEC)—an interesting contrast with the attitude adopted in September at the Commonwealth conference in London by the ex-British African states, which refused to have this connection if Britain joined the EEC.

The largest and most impressive meeting of African leaders yet held was the conference at Lagos, Nigeria, Jan. 25–30, 1962. Twenty states were represented, 16 of them by heads of state or government. It was, substantially, a second meeting of the Monrovia group, so named from the meeting at Monrovia, Liberia, May 8–12, 1961. Those who attended the Lagos meeting were the Brazzaville Twelve, plus Congo (Léopoldville), Ethiopia, Liberia, Nigeria, Sierra Leone, Somalia, Tanganyika, and Togo. The five states of the Casablanca group—Ghana, Guinea, Mali, Morocco and the United Arab Republic (that is, Egypt)—were absent, as were Tunisia (which had been at Monrovia), Libya, and the Sudan. There was thus a clear geographical split, with North Africa not represented. Numerically the roster was the same at Monrovia, because Tanganyika and Congo (Léopoldville) were present for the first time. All eight of the absentees had been invited, since the sponsors had hoped for a genuine and comprehensive pan-African meeting. The refusal of the eight was due to the fact that the Algerian Provisional Government was not invited.

Leaders of the "Casablanca bloc" African countries pray at opening of meeting in Cairo, June 15. From left to right, front row, are President Keita of Mali, Premier Ben Khedda of the Algerian Provisional Government, King Hassan II of Morocco, President Touré of Guinea, and President Nasser of the UAR. Ghana is also a member of the Casablanca bloc.

UPI

One of the things made clear at the conference was that the Monrovia states harbor strong suspicions of the territorial ambitions of some Casablanca leaders, notably Gamal Abdel Nasser of Egypt and Kwame Nkrumah of Ghana. The Monrovia group favors cooperation between states, whereas their opposite numbers often speak in terms of unions and mergers. In his opening address, the governor general of Nigeria, Dr. Nnamdi Azikiwe, spoke bluntly of this difference of attitude. He declared that there was a "conspicuous absence" in the Casablanca group's policy declarations of any reference to the fundamental principles of "the inalienable right of African states, as at present constituted, to legal equality, irrespective of their area and population; . . . to self-determination; . . . to safety from interference in their internal affairs. . . ."

At Lagos, considerable steps were taken toward practical cooperation. A draft charter was drawn up for an Inter-African and Malagasy States Organization; this was approved at a meeting of the foreign ministers in Lagos on June 2, but awaits ratifications to become effective.

The Casablanca group held a conference in Cairo, June 15–18, at which formal approval was given to the establishment at Accra, Ghana, of a joint High Command. It was not clear, however, whether there was to be an actual pooling of armies, but this seems improbable.

Political Stability.—Taking into account how violent has been the pace of change in Africa in the past two or three years, and what possibilities of disaster lurk in its poverty and its unstable political structures, 1962 might be regarded as a year of comparative stability. It is true that the problem of provincial (or tribal) separatism still existed within the former Belgian Congo, but at least the central government under Premier Cyrille Adoula

had continued in existence for a year and a half. The alliance of convenience between President Moise Tshombe of Katanga Province and the great mining concern, the Union Minière du Haut-Katanga, continued to baffle Secretary General U Thant of the United Nations, and others.

Stronghold of White Supremacy.—In the extreme south of the continent, beyond what some observers were naming Africa's Mason-Dixon line, white supremacy, only faintly disturbed thus far, continued to be the rule in flat denial of the tendencies victorious elsewhere. The areas of this kind were, in addition to the Central African Federation previously mentioned, the Portuguese colonies of Angola and Mozambique, and the Republic of South Africa. In Angola a sporadic rebellion appeared to be in progress, but little news leaked out. In January, South Africa announced plans for an autonomous Bantu area, the Transkei, thus actually embarking on implementation of its announced policy of separate racial development. Eight such "Bantustans" are contemplated. Observers differ on the significance of this step, some regarding it as meaningless, others as a revolutionary development which will lead to greater self-determination for the nonwhites of the republic.

AGRICULTURAL RESEARCH SERVICE

This service (ARS), an agency of the U.S. Department of Agriculture, conducts basic and applied research to develop better methods of farming, improved varieties of plants and breeds of livestock, and new and improved uses for farm products. Other research is aimed at ways of improving human nutrition and consumer use of food, fiber, and other products. The ARS also conducts regulatory programs to keep meat wholesome, to prevent foreign pests and diseases from entering the United States, and to attempt to eradicate or control pests and diseases already present.

Crops Research.—The isolation of an immature form of tobacco mosaic virus (TMV) from leaves of infected tobacco plants by an ARS scientist has opened the way to new understanding of how viruses develop and cause disease in plants. These smallest and least complex organisms, which have shown activity only within a host, have remained perhaps the most mysterious of living things.

The discovery of a natural plant growth regulator, abscisin, in immature cotton bolls may aid development of more effective chemical defoliants. Abscisin is the first natural material known to promote leaf and fruit drop.

Plant breeders again released dozens of improved varieties of a wide range of food and feed plants. A new disease-resistant safflower breeding line was developed to assist this increasingly important oilseed crop in the United States.

For shippers and shoppers, breeders developed new hybrid onions that package well in retail containers, and geneticists found a way to subdue the characteristic that makes potatoes turn green when exposed to light. A wild rose highly resistant to most forms of black spot provided breeding material that may eventually lead to the development of rose varieties resistant to this costly disease.

A widespread disease of tobacco, weather fleck, was definitely linked to concentrations of ozone in slow-moving, polluted air. Ozone, a chemically modified form of oxygen, causes injurious lesions on growing tobacco leaves, resulting in economic loss in cigar-wrapper tobacco grown in the Connecticut River Valley. Plant injury from weather fleck was reported in other eastern states.

UNITED NATIONS

Under United Nations protection since August 1961, Baluba tribesmen who lived in the Elisabethville area of the Congo's Katanga Province were returned to their tribal lands in mid-1962. Above, Swedish troops of the UN Force help a group of refugees board a plane at the Kamina airbase in Katanga for a flight to Luluabourg, Kasai Province, from which the Baluba were transported to their home villages.

Entomology Research.—Entomologists at the new ARS boll weevil research laboratory for the first time extracted the substance that makes cotton appetizing to boll weevils. If scientists can chemically analyze the substance (called an arrestant) and then synthesize it, they may be able to use it to treat plants other than cotton and make boll weevils lay eggs on plants where newly hatched larvae would starve; or they may be able to breed cotton varieties that do not contain the arrestant.

Kafir-type grain sorghums proved more resistant to European corn borer damage than milo-type sorghums in a screening program for varieties useful in breeding borer-resistant sorghums.

The discovery of insecticides that effectively control the aphids that carry bean yellow mosaic virus, a disease that seriously reduces seed production of yellow lupines, may permit production of this valuable legume again in the southeastern United States.

Several South American insects showed promise as controls for alligatorweed, a costly aquatic pest of waterways in the southern United States. The use of insects against weeds can be an effective biological method of controlling some weeds.

Livestock Research.—Laboratory strains of drug-resistant coccidia, microscopic organisms that cause the poultry disease coccidiosis, were developed and studied by ARS scientists to learn if such resistance can be overcome. These parasites gradually acquired resistance to every drug tested. Scientists plan to classify drugs in terms of how quickly coccidia can build resistance to them, so that farmers will know the most effective drugs to use in combating coccidiosis outbreaks in flocks already receiving a drug.

Research efforts to improve livestock feeds and to learn how animals can use such feed most efficiently for maximum meat and milk production continued. Tests showed that high-nitrogen molasses, a byproduct of an experimental sugar-refining process, could become a valuable source of nitrogen in livestock rations.

By properly packing and sealing conventional

upright silos, researchers produced low-moisture alfalfa silage equal in feeding value to baled hay, the standard against which other forages are judged. Combined drylot feeding and grain-pasture grazing proved better for fattening steers in the South than drylot feeding alone.

Agricultural Engineering Research.—An experimental wall panel, made of a 2-inch layer of plastic between half-inch layers of reinforced portland cement, was developed for use in farm buildings. The panels are light enough to be handled by two or three men, and no special tools or equipment are needed to erect a one-story building with them.

Sheet coverings of high-density polyethylene and of Teflon—a plastic already used to line frying pans made for cooking without fat—both proved able to keep soil from sticking to plows.

Plastic solar heat collectors were developed experimentally for drying grain, and also showed other potential uses, such as warming animal shelters and helping to heat rural homes. Transparent plastic admits sunlight at the top and sides, and black plastic on the ground absorbs heat. The warmed air is drawn out of the collector by a fan.

Soil and Water Conservation Research.—Tests showed that plant roots fail to grow well in compacted soil layers just below tillage depth because they cannot penetrate the layers, not because of lack of air or moisture, as was previously suspected.

In the western United States, new low-cost chemical treatments used experimentally gave 80% control of water seepage for about 10 cents a square yard—one tenth the minimum cost of efficient conventional canal- and ditch-lining materials. Seepage is a major cause of losses of irrigation water in the arid West.

A new type of plastic liner for mole drains and improved equipment for installing it may make possible the use of low-cost subsurface drainage systems by agriculture and the construction industry.

On waterways used to carry flood runoff from terraced and contour-cropped fields, roadways, and airports, glass fiber mat was found to give grass seeds efficient protection from rain runoff until the grass roots take hold,

Utilization Research.—Seeking new uses for abundant agricultural products, scientists for the first time successfully blended cereal pulp with wood pulp to improve paper quality. The mixture appeared better than all-wood pulp for papers that require extra strength. Use of dialdehyde corn starch also strengthened paper and board pulps. Utilization scientists worked out a better industrial process for adding the starch to give paper wet strength, and combined the starch with casein to make a paper coating adhesive highly resistant to abrasion and moisture. The starch increased both the wet and dry strength of insulating board and improved its insulating value.

Chemical research is helping cotton and wool to compete better with synthetic fibers. Three methods for manufacturing all-cotton stretch yarns and fabrics were developed to make cotton more useful in automobile upholstery and linings, knit garments, hosiery, and furniture slipcovers. A single treatment was developed that gave cotton wash-and-wear properties, permanently dyed and starched the fabric, and added other fabric-finishing agents. A new formaldehyde treatment also improved wash-and-wear characteristics of cotton.

New processes which make wool garments highly resistant to shrinking and permit permanent creasing and pleating were developed successfully through the pilot-plant stage.

Experiments showed that citrus byproducts can be substituted for an expensive chemical (beta-ionone) used to produce beta-carotene, which supplies vitamin A for pharmaceuticals and animal feeds.

Nutrition and Consumer-Use Research.—Measurements of specific activities by homemakers in using and caring for equipment and furniture, and of such basic movements as walking, bending, and reaching, were used to develop space standards for household activities. Architects, builders, and home owners will use these cooperative research findings in planning and remodeling houses.

The fatty portions of beef, lamb, and pork give these meats their distinctive flavors; the lean portions all taste about the same, chemists concluded from basic research on meat flavors. A fresh lean pork roast can be as juicy and tender as one with a thick fat covering, however, and it requires less roasting time. High fat content is not essential to good eating quality of lamb. (See also FOOD RESEARCH.)

Foreign Research.—Since 1958, the U.S. Department of Agriculture has made more than 300 research grants to institutions in foreign countries. Sale of surplus farm commodities for foreign currencies finances this long-range research, which aims at benefiting agriculture in the United States as well as in other countries. For example, scientists in Finland have found that many plants of the mustard family contain a thiocyanate ion that prevents the thyroid of animals feeding on these plants from absorbing iodine. The animals do not develop goiter, however, and it was found that cows on a mustard-family diet do not pass along enough iodine-blocking ions in milk to cause goiter in man.

Polish scientists have found that unpalatable but more productive varieties of blue lupines get their bitterness from high levels of alkaloids, and that seeds of desirable sweet varieties are low in these alkaloids and high in free arginine, an amino acid. This knowledge will aid in breeding high-producing sweet varieties.

Regulatory Programs.—Among large-scale programs to eradicate several animal diseases and pests from the United States was a program to eradicate screwworms from large areas of the southwestern United States, employing methods that have proved effective in the southeastern states. A dozen states began programs to eradicate scabies, a costly sheep disease; 29 states were entirely free of sheep scabies.

A campaign against brucellosis in swine gained impetus, and by August 1962, almost three fifths of the states and three fourths of the counties had achieved a low incidence of the disease in cattle.

The red tick, a potential carrier of several animal diseases, was eradicated from the United States. This African parasite was found on zoo animals in two states in 1960.

Greater emphasis was given to regulation of pesticides, under laws intended to protect the public from losses and possible personal injury through faulty, misbranded, or adulterated products. Broadened regulations brought under federal surveillance many additional chemicals used for destruction or repelling of pests.

Plant pest-control programs continued to retard the spread of unwanted diseases and insects. The number of sweet potato weevils was reduced to a 20-year low in the southeastern United States by a concentrated grower-state-ARS campaign to kill overwintering weevils, aided by a severe January freeze.

A newly developed attractant bait for the imported fire ant, extensively field-tested in the southeastern United States, requires only one seventh of an ounce of insecticide to the acre.

The Mediterranean fruit fly again invaded Florida, and an all-out state-federal campaign was begun to eradicate this pest from the state.

Changes were made in import regulations of animals, animal byproducts, and related materials, to give greater protection against foreign livestock and poultry diseases. More than a million foreign animals—a 72% increase over the previous year—were inspected and allowed to enter the United States in the year ending June 30, 1962. More than 65,000 were rejected for entry. More than a billion pounds of imported animal products were inspected.

Quarantine workers inspected 137,000 airplanes, 60,000 ships, 25 million motor vehicles, and 64,000 railway cars at United States ports and borders during the same period. They intercepted damaging insects, nematodes, diseases, and other plant pests 36,000 times, and found 385,000 lots of prohibited plant material, much of it in the 24 million pieces of travelers' baggage inspected.

The first year of administration of the federal Humane Slaughter Law (ended June 30, 1962) saw more than 100 million animals dispatched humanely. Some 107 million animals passed ARS meat inspection standards; almost 280,000 were found unfit for food.

E. G. Moore,
Director, Information Division.

AGRICULTURE

Despite the smallest acreage planted and harvested in half a century, United States farm output reached another new high in 1962.

Crop production was estimated in November 1962 to be about the same as in 1961, though 2% below the record high of 1960. Livestock production, however, was the highest ever, sending farm output overall to a new record.

Crop yields per acre scored another advance. The composite yield-per-acre index covering 28 leading crops was 111 (1957–59 = 100), compared with 109 in 1961, the previous high. Corn and tobacco reached new highs for per-acre yields, while grain sorghums and peanuts were exceeded only once before.

Farm prices for the first 10 months of the year averaged about 1% above those of 1961. October prices stood about 2% higher than in the same month a year earlier. The cost of goods farmers buy was also 1.3% higher in January–October 1962 than a year earlier.

Food consumption per person in the United States during 1962 remained about 13% above that of 1935–39. Total consumption of food increased slightly, keeping pace with the population increase of 1.6%. Retail food prices averaged about the same as in 1961, with prices for foods from crops slightly higher and those from livestock a little lower.

Farm Production.—The corn crop for grain was estimated in November at 3.6 billion bushels, about 35 million bushels below 1961 and 8% less than the record crop of 1960. The grain sorghum crop —490 million bushels—was a little above 1961 but 21% below the 1960 high. Production of soybeans, 669 million bushels, was 3% below 1961 but the second highest in history and 60% above the 1951–60 average.

The wheat crop was 11% below that of 1961 and 3% under the 1951–60 average. Barley, rice, rye, cotton, tobacco, hay, peanuts, dry beans, dry peas, potatoes, sugar beets, sugarcane, apples, grapes, peaches, cranberries, and cherries were all above the 10-year averages, while output of oats, flaxseed, hops, sweet potatoes, apricots, pears, and pecans was relatively smaller.

Acreage.—Major crops were planted on only about 300 million acres and harvested on about 288 million in 1962, both the smallest since record keeping began in 1909. Harvested corn acreage was down 2%, soybean acreage was up 2%, and cotton and barley were about the same as in 1961. Wheat acreage was down 15%, and oats, 4%; but acreage in sorghums was up 3%.

Food and Feed Grains.—Production of the four major feed grains (corn, grain sorghums, oats, and barley), was estimated at 141 million tons, a little above the 140.6 million of 1961 but about one tenth below the 1960 record. The reduction since 1960 is due principally to the feed grain programs of 1961 and 1962, under which growers of corn and grain sorghum (and barley in 1962) received government payments for taking acres out of production.

Wheat production in 1962 was estimated to be 1,095,225,000 bushels, compared with the 1961 crop of 1,234,705,000 bushels; the 10-year (1951–60) average was 1,128,563,000. The smaller 1962 crop resulted from a wheat program similar to that for the feed grains.

Wheat supplies for the 1962–63 marketing year were estimated at 2,405 million bushels, about one tenth below the level of the two previous years. The supplies are made up of the 1962 crop, carry-over stocks of about 1,300 million bushels, and a small expected quantity of imported wheat. Domestic needs for wheat in 1962–63 may total about 605 million bushels, and exports may be about 600 million bushels. This would reduce the carry-over on July 1, 1963, to about 1,200 million bushels.

Producers narrowly approved acreage allotments and marketing quotas for 1963 wheat in a referendum held in August 1962. Congress later provided a voluntary diversion program for 1963 wheat and a permanent, two-price certificate program to start in 1964 if it is approved by two thirds or more of the producers voting in a referendum. The two-price program provides price support at a higher level for wheat used for domestic food and some exports than that for wheat used for feed.

Corn production for 1962 was estimated at 3,590,238,000 bushels, compared with 3,624,313,000 in 1961 and the 1951–60 average of 3,128,197,000 bushels. The all-corn yield of 62.4 bushels per harvested acre was 0.6 bushel higher than the previous record of 1961. The corn supply for 1962–63 was estimated to be about 5.2 billion bushels, about 400 million less than a year earlier.

Congress enacted a voluntary feed grain program for 1963 crops of corn, grain sorghum and barley similar to the 1961 and 1962 programs. The major difference is a provision for making a payment to corn producers of 18 cents a bushel in addition to a corn loan of $1.02 a bushel for price support purposes. This 18-cent payment would be in the form of marketable certificates. In the 1961 and 1962 programs, the price support loan was $1.20 per bushel. The direct payment provision will keep noncooperators from benefiting from the higher market prices brought about by the loan support level of $1.20 per bushel. (See also Grains.)

Cotton.—A cotton crop of a little more than 14.5 million bales was forecast for 1962, a little less than in 1961 but about 4% larger than the 1951–60 average of just under 14 million bales. Cotton consumption in 1961–62 was about 14 million bales, 9 million for domestic uses and 5 million for export. This resulted in an increase in carry-over on Aug. 1, 1962, to 7.8 million bales, 600,000 more than a year earlier. Cotton requirements for 1962–63 may be only 8.6 million bales for domestic use and 5 million for export. This would produce a further increase in carry-over on Aug. 1, 1963. (See also Cotton.)

Other Crops.—The rice crop of 63.6 million 100-pound bags in 1962 was 19% above 1961 and 24% above the 10-year average.

Production of fall fresh vegetables was expected to be about 5% below that of 1961. The tonnage of nine important vegetable crops for processing, however, was 13% larger than in 1961. Output of noncitrus fruits was 1% smaller than in 1961, but 5% above the 10-year average. Citrus production was slightly higher than in 1961. Combined production of edible nuts was only two thirds that of 1961. Potato production—264,877,000 bushels—was 29 million bushels less than the 1961 crop but 30 million above the average. (See also Fruits; Vegetables.)

Tobacco production was estimated at 2,200,340,000 pounds, compared with 2,058,302,000 in 1961 and the 10-year average of 2,040,358,000. (See also Tobacco.)

Livestock.—Production of livestock and livestock products in 1962 was at an all-time high. Larger output of dairy products and meat animals more than offset a decline in output of poultry. Aggregate production of beef, veal, lamb, mutton, and pork reached a record 28,930 million pounds, compared with 28,585 million in 1961. About 2.5 million head of cattle and calves were added to numbers on farms during 1962, so that the total

as of Jan. 1, 1963, was expected to reach about 102 million, exceeding 100 million for the first time.

The hog slaughter in 1962 was estimated at 82.7 million head, compared with 82.1 million a year earlier. The spring pig crop in 1962 was a little smaller than in 1961, and the fall crop was a little larger.

The 1962 lamb crop, about 20.4 million head, was 4% smaller than in 1961. The number of sheep and lambs has been declining since 1959, and the inventory of sheep and lambs at the end of 1962 was probably the smallest since 1950. The number on farms was estimated to be 33.4 million at the beginning of 1962.

The poultry industry had its first production downturn in years. Both broiler and turkey output decreased, with turkeys down 15% from the record 1961 crop. Nevertheless, the 92 million birds produced during 1962 constituted the second highest production on record. Egg production was slightly above that of 1961. However, the per-capita consumption of eggs continued the uninterrupted decline that began in 1952.

WIDE WORLD

Signing the Food and Agriculture Act of 1962 on September 26, President Kennedy gives the first pen to Sen. Ellender (La.), head of the Senate Agriculture Committee. Also shown (l. to r.) are Rep. Cooley (N.C.), Agriculture Secretary Freeman, Vice President Johnson, Sen. Humphrey (Minn.), Harry Caldwell, head of the National Agricultural Advisory Commission, and Reps. Gathings (Ark.) and Poage (Texas).

Milk production for 1962 was about 126.5 billion pounds, a new record, surpassing by 1 billion pounds the previous high of 1961. Milk production per cow continued its steady climb, reaching 7,325 pounds, compared with the 1961 average annual output of 7,211 pounds. (See also DAIRY PRODUCTS.)

Agricultural Income and Prices.—Farm net income, after rising $1.1 billion dollars in 1961, to $12.8 billion, remained at this level in 1962. Gross income (cash receipts, plus the value of home-consumed farm products, rental value of farm dwellings, and government payments) was about $40.5 billion. Farm production expenses were about $27.7 billion. Both farm gross income and production expenses in 1962 were about $0.6 billion more than in 1961. But while farm net income remained stable, income from off-the-farm sources continued to increase. Per capita income of farmers from all sources probably exceeded $1,400 in 1962, a record figure but still only about 60% of the per capita income of nonfarm persons.

The index of prices received by farmers in October 1962 stood at 245% of the 1910–14 average. This contrasted with 240% for the corresponding month of 1961 and the high of 313% in February 1951.

Prices paid by farmers in October 1962 were more than triple the 1910–14 average, the index standing at an all-time high of 307, compared with 301 a year earlier.

In terms of the parity ratio (parity being the price at which farm products would have the same buying power as in 1910–14), farm prices in relation to farm costs stood at 80%, the same as a year earlier, but far short of the record high of 123% in October 1946.

Consumption of Food.—Domestic food utilization in 1962 continued at a high level. Civilian consumption of food per capita was at the same level as in the three preceding years, about 13% above the 1935–39 average. Record per capita quantities of meat (red meats and poultry) were consumed, as well as record amounts of cheese, frozen fruits, and frozen and canned vegetables.

Civilian consumption of beef, at about 89 pounds per person for the year, exceeded 1961 consumption by about 1 pound. Pork consumption was about 63 pounds, three fourths of a pound more than in 1961. The annual per capita consumption of red meats—beef, veal, pork, lamb, and mutton—was 162.5 pounds. Consumption of 37.2 pounds of poultry meat brought the total per capita figure to 199.7 pounds, 1 pound more than in 1961.

With heavy production during 1962, large numbers of animals on farms, and ample feed supplies, prospects for 1963 were for still larger consumption of meat and dairy products. (See also MEAT INDUSTRY.)

Farmers' Share of the Food Dollar.—Farmers received 38 cents out of the average dollar spent for food in the family "market basket" during 1962. This was the same as in 1961, but 2 cents below the 1957–59 average and 9 cents less than a decade earlier. Part of the decline is due to the preparation of food by the marketing system in more convenient form for consumers to use.

Agricultural Assets.—The physical assets of United States agriculture increased by perhaps 3% during 1962. Total assets as of Jan. 1, 1962, were calculated at $207.5 billion, compared with $200 billion a year earlier. Assets at the end of 1962 were probably about $214 billion. While farm indebtedness also increased, the rise was less than that of assets, so that proprietors' equities were probably about $185 billion at the year's end.

Land Values.—Market values of farm real estate resumed their upward trend during 1961 and 1962. The total market value of farmland and buildings was estimated at almost $141 billion on July 1, 1962, which was about $7 billion above a year earlier.

Agricultural Exports.—The value of United States agricultural exports reached a new peak of $5.1 billion in the fiscal year ended June 30, 1962. This was 4% more than the previous year's record of $4.9 billion. Most of the increase was brought about by wheat and feed grains, the leading United States farm surplus commodities. Wheat exports totaled a record 716 million bushels.

Cotton was the only major export commodity for which exports declined. The decrease was sharp —more than 2 million bales from the 7 million shipped in 1960–61.

The European Economic Community (Common Market) caused United States agricultural

leaders increasing concern during the year, as Common Market leaders considered erecting high tariff barriers against farm products from outside nations. Western Europe is the best customer for United States agricultural products. Secretary of Agriculture Orville L. Freeman and other leaders made strong efforts during the year to persuade the European governments to adopt and maintain liberal trade policies toward United States farm and other products. (See also EUROPE.)

Agricultural Employment.—An average of 6,770,000 persons—including full- and part-time farm operators, full- and part-time hired workers, and unpaid family labor—worked on United States farms in 1962. Comparative figures were 6,990,000 in 1961 and 9,149,000 in 1952. Farm output per man-hour of work was 123% of the 1957–59 average. The composite hourly wage (an average of all wage rates on a per-hour basis, excluding allowances for room and board) was 86 cents, compared with 83 cents in 1961 and 66 cents in 1952.

Other Highlights.—A major effort to expand development activity in rural areas was made in about 1,600 counties in all 50 states during 1962. Some 50,000 persons in rural and small town communities were involved in rural development planning and other activity. About 2,700 rural area development projects had been planned in the fall of 1962, and 900 were already being put into operation.

The Department of Agriculture loaned farmers and other rural persons a record $637 million during the fiscal year 1962—61% more than a year earlier and more than double the figure for the fiscal year 1960. More than 200,000 families were using such credit in 1962.

The Agriculture Department approved 242 electrification loans totaling $261 million during the fiscal year. The five-millionth electric consumer was served with electric power during the fiscal year 1962, and the billionth dollar in principal was repaid on rural electrification loans.

The Pilot Food Stamp Program, begun in eight areas in 1961, was being expanded into 25 additional localities in 1962 and early 1963.

About 14.2 million children in 65,000 schools participated in the National School Lunch Program. The Special Milk Program operated in 88,000 schools and other institutions and served 2.4 billion half-pints of milk.

Department of Agriculture food distribution programs served one out of every six persons in the United States. About 2 billion pounds of food were distributed, 50% more than a year earlier.

Much attention was given to the potentialities of recreation as a "farm crop." Legislation was enacted authorizing loans to farmers to help them develop the recreational potential of their land and water for use by urban dwellers in search of life in the outdoors. That recreational facilities are in great demand is indicated by the increasing number of visits to national forests. Such visits increased from 92 million in 1960 to 102 million in 1961 and 112 million in 1962.

(See also CONSERVATION OF NATURAL RESOURCES; FARM SERVICES; FOOD SUPPLY; STANDARDS OF LIVING.)

C. J. ENZLER,
Information Specialist, Office of Information, U.S. Department of Agriculture.

AIR FORCE, U.S.

The total number of combat wings in the Air Force rose from 88 to 97 in 1962, comprising both aircraft and missiles. Most of the increase centered in the tactical air forces and reflected a growing emphasis on limited warfare and support of ground forces with conventional weapons.

Tactical Forces.—The Tactical Air Command (TAC) was involved in two new developments in 1962—the newly established unified air-ground command, United States Strike Command (USSTRICOM), and counterinsurgency or anti-guerrilla operations.

On Sept. 19, 1961, Secretary of Defense McNamara established USSTRICOM with temporary headquarters at McDill Air Force Base, Fla. Headed by an Army Commander-in-Chief with an Air Force deputy and chief of staff, USSTRICOM included two component commands—the Air Force Strike Command (AFSTRIKE) and the Army Strike Command (ARSTRIKE).

The Air Force devoted a major effort to counterinsurgency. On April 27, 1962, the Special Air Warfare Center was established at Eglin AFB, Fla., with two operational organizations under it—an Air Commando Group to improve techniques for use of aircraft in counterinsurgency measures,

WIDE WORLD

In an attempt to force cattle prices upward, members of the National Farm Organization meet at Indianapolis Stockyards, September 13, to dissuade farmers from selling their stock.

and a Combat Application Group to develop, test, and evaluate new tactics and equipment.

During 1962, TAC aircraft logged about 17 million miles of operational flying, with an average of about 500 aircraft deployed at all times. Almost every one of the 53,000 men in TAC participated in at least one of the 25 training exercises conducted.

Exercise Red Hills, held at Fort Campbell, Ky., during the first two months of 1962, simulated the deployment of Army and Air Force units to overseas bases for joint airborne operations against an aggressor. Exercise Banyan Tree III, held in Panama during February and March 1962, tested the deployment of a USSTRICOM task force, employing it in combat operations, and returning it. Exercise Clear Lake, held at Eglin AFB from May 25 to June 10, 1962, refined the techniques of air-ground support with conventional weapons.

Strategic Forces.—The Strategic Air Command (SAC) in 1962 had more than 2,600 combat aircraft, including B-47's, B-52's, B-58's, and a tanker fleet of KC-135's and KC-97's. During the year, four heavy bomber squadrons were equipped with B-52H's, and three heavy tanker squadrons with KC-135's. The missile force was increased by three Atlas and five Titan I squadrons.

REPUBLIC AVIATION CORP.

The F-105D can be armed with 4,000 different combinations of the nuclear and conventional weapons shown in display.

To increase the effectiveness of the B-52 force, 23 squadrons were modified to carry the GAM-77 Hound Dog air-to-ground missile, which can reach out some 600 miles ahead of the bomber's course. Meanwhile, testing of the GAM-87A Skybolt air-launched ballistic missile began at Eglin AFB on April 19, 1962. Skybolt will have double the range and far greater speed than Hound Dog.

The B-52H demonstrated its intercontinental capability when, on Jan. 10, 1962, it flew from Kadena Air Base, Okinawa, on a nonstop, nonrefueled flight to Torrejon Air Base, Spain. The bomber broke two world distance records and nine course speed records. Elapsed time for the 12,519-mile flight was 21 hours, 52 minutes, and 42 seconds, for an average of 575 mph. On March 5, 1962, a B-58 Hustler earned the Bendix Trophy for a cross-country flight from Los Angeles to New York in 2 hours and 56.8 seconds, averaging 1,214.71 mph. The plane also set a New York-to-Los Angeles record of 2 hours, 15 minutes, and 48.6 seconds—more than 41 minutes faster than the earth's rotation—and averaging 1,081.77 mph. A quick aerial turn-around enabled the aircraft to set a new round-trip record of 4 hours, 41 minutes, and 11.3 seconds, averaging 1,044.96 mph.

Missiles contributed increasingly to the deterrent force. SAC accepted its last Atlas E squadron in November 1961, several weeks ahead of schedule. On April 18, 1962, the first Titan I operational squadron entered the SAC inventory, and four additional squadrons were added by the end of June.

Atlas continued to demonstrate its operational reliability. On Feb. 15, 1962, a missile combat crew launched Operation Big John from Vandenberg AFB, initiating a new program of proficiency launches. On March 23, SAC demonstrated its operational missile capability to President Kennedy when a combat crew counted down an Atlas D and launched it to an impact accuracy of eight tenths of a mile. On July 12 another proficiency launch impacted an Atlas D on target in the Philippine Sea after a 7,000-mile flight from Vandenberg AFB. SAC fired two Atlas ICBM's in quick succession on August 9 for the first multiple countdown and launch. Both weapons impacted on target 5,000 miles downrange.

Both Titan II and Minuteman were also proving their reliability. On March 16, 1962, the Titan II made its first test flight, streaking 5,000 miles downrange and achieving all test objectives. Titan II has a jam-proof all-inertial guidance system and faster reaction time than Titan I. It will be fired from inside the silo rather than elevated to the surface, as is Titan I.

Of 16 firings of the SM-80 Minuteman completed by June 30, 1962, all but two were successful. In December 1961, the Air Force canceled development of a mobile version of the Minuteman in order to increase the total number of missiles in hardened sites. In May 1962 research and development began on an improved Minuteman with greater range, payload, and accuracy. (See also Missiles.)

Air Defense.—The Air Defense Command (ADC) in 1962 improved its capability to support the North American Air Defense Command (NORAD). Approximately 70% of the men and equipment of NORAD come from ADC, including more than 110,000 personnel and a capital investment of nearly $8 billion. The Continental Aircraft Control and Warning System (416L), which includes the Distant Early Warning (DEW) Line, the Semi-Automatic Ground Environment (SAGE) System, the Canadian Air Integration North (CADIN), and other elements, was about 80% complete at the end of the fiscal year 1962. To further extend its early-warning capability, ADC took over, on July 1, 1962, the radar stations and fighter-interceptors stationed in Iceland.

The SAGE System, completed in late 1961, ties together the 21 direction centers housing computers and automated equipment, communication lines, radar stations, and radio sites into an interconnected system. Early in the fiscal year 1962 the Air Force began work on a back-up interceptor-control system (BUIC) to provide an alternative capability should SAGE centers be destroyed. Phase I, which would provide a manual capability based on 100 radar stations, was 80% operational at the end of the fiscal year 1962. In March 1962 the Air Force began Phase II, which would provide a semiautomatic back-up control system based on 34 alternate control centers.

The last of eight Bomarc missile sites in the United States became operational in January 1962 at Niagara Falls, N.Y. The F-102 began operation with a new nuclear air-to-air missile, the GAR-11 (Falcon).

In a three-part agreement aimed at improving the air defense capability of Canada, the Air Force transferred 66 F-101B's to Canada. In return, Canada took over operation and funding of 11 Pinetree radar sites. The first site, at Beausejour, Manitoba, was transferred to Canada on Oct. 1, 1961. Three other sites had changed hands by June 30, 1962. The third part of the arrangement involved the procurement in Canada of F-104 aircraft for the North Atlantic Treaty Organization (NATO). Canadian radar technicians and F-101 pilots were being trained by ADC.

While most of these developments related to ADC's capability against manned aircraft and atmospheric missiles, the capability in space also improved. On Jan. 1, 1962, the 9th Aerospace Defense Division assumed control of the two Ballistic Missile Early Warning System (BMEWS) sites at Clear, Alaska, and Thule, Greenland. To operate these and a third site at Fylingsdale Moor, England (expected to be completed in 1963), the 71st Surveillance Wing was activated.

To survive against a surprise attack, the Air Force in the summer of 1961 began building an impregnable underground shelter for the NORAD Combat Operations Center (COC). Excavation has been completed, and the design and testing of equipment is under way.

Airlift.—The Military Air Transport Service (MATS) participated in exercises with Army and Navy units involving joint airborne training and tests of strategic mobility and general war plans. Exercise Long Thrust IIA, held in January 1962, was a test of strategic mobility in which MATS employed its new C-135 jet transports to deploy a USSTRICOM battle group. The jets flew nonstop from McChord AFB, Washington, over the North Pole to Rhein-Main, Germany, in approximately 10½ hours, in contrast to the 32 to 36 hours required by piston-driven aircraft. In Exercise Great Shelf, in February 1962, MATS deployed a USSTRICOM battle group from Fort Campbell, Ky., to the Philippines. MATS also supported NATO in Exercise Checkmate, designed to test defensive capabilities of air, ground, and naval forces. This involved the airlift of a USSTRICOM battle group and the support for a Composite Air Strike Force from the United States to the Middle East.

MATS also carried out a number of special assignments. In support of Operation Deep Freeze Sixty-Two, it airlifted over 1,800 tons of supplies and equipment to McMurdo Sound, the South Pole, and other sites in Antarctica. In support of Project Mercury, MATS moved items to Cape Canaveral and airlifted the tracking personnel and their equipment to sites around the world. Other special assignments included continued support of the United Nations operation in the Congo; the airlift of more than 1 million pounds to resupply troops in remote areas of Pakistan; and mercy missions, such as airdropping 1,549 tons of maize in a flooded area of Tanganyika.

The modernization program made progress in 1962 with the delivery of 41 C-135's. The C-135 can fly twice as many missions in a five-day period as older transports, and its ton-mile capability per flying hour is about 2½ times as great. The first C-135B, with more powerful turbofan engines, entered the MATS inventory in March 1962. The first two turboprop C-130E's were accepted in April 1962.

The Air Rescue Service (ARS) of MATS assumed responsibility on Oct. 1, 1961, for base rescues by helicopters. During the remaining nine months of the fiscal year 1962, ARS helicopters flew 4,917 missions, saved 74 lives, and assisted 796 distressed persons. During the entire year ARS fixed-wing aircraft saved 201 lives and assisted 540 people in distress.

Research and Development.—The Air Force Systems Command (AFSC), staffed by 26,650 officers and airmen and 37,000 civilian employees, is accountable for all Air Force aerospace systems. It directs the spending of about 40% of the Air Force budget (more than $7 billion in the fiscal year 1962) and handles some 54,000 contracts annually.

AFSC's Maj. Robert M. White piloted the X-15 rocket plane to an altitude of 314,750 feet on July 17, 1962. He became the first aircraft pilot to earn astronaut wings, reserved for those who have flown higher than 50 miles.

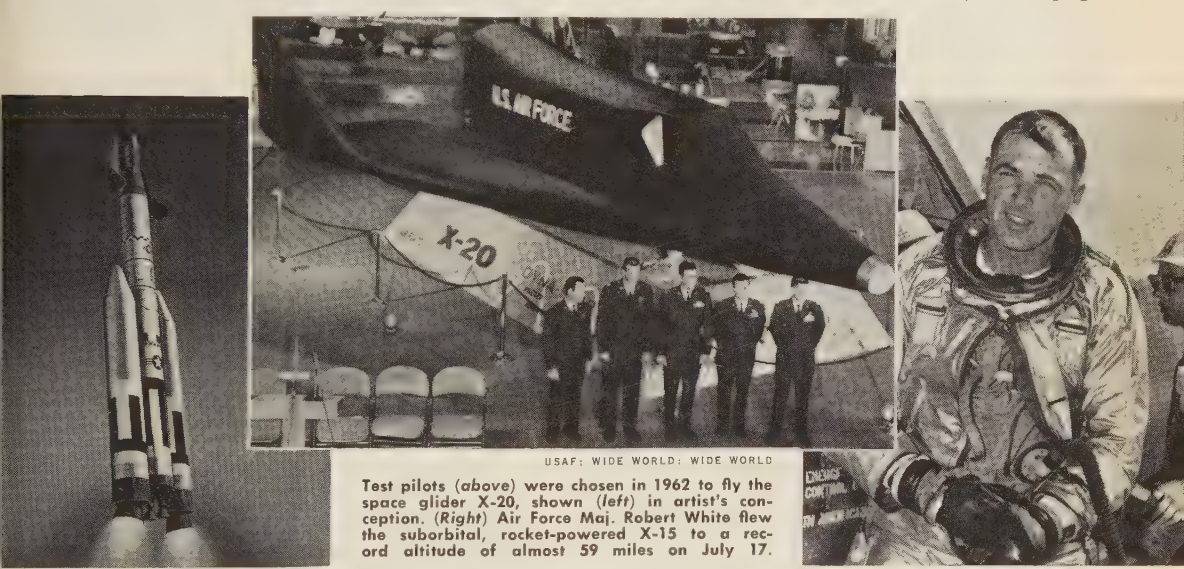
The first live test of a rocket-powered escape capsule was conducted Jan. 31, 1962, when a chimpanzee was safely ejected from a B-58 traveling at 650 mph. at a 20,000-foot altitude. On February 28 the first manned test was also successful when a man was ejected from an altitude of 20,000 feet while the B-58 was flying at 565 mph.

Space Research.—In February 1962 the Department of Defense directed the military departments to assist the National Aeronautics and Space Administration (NASA) in achieving common civil and military space objectives pertaining to lunar expeditions. The Air Force was assigned responsibility for supporting specific NASA projects by handling research, development, test, and engineering of satellites, boosters, space probes, and associated systems. In April an office was set up in AFSC to manage this supporting effort.

In May, military efforts in the field of communication satellites were realigned, with major responsibilities shifted from the Army to the Air Force. The Air Force will develop the satellite vehicle (including the payload), the launch vehicle, and the ground control system. The Defense Communications Agency was designated to manage and integrate the entire system.

The Air Force continued to launch Discoverer satellites into orbit and recover them, gaining invaluable data that could be applied to future systems. Each of two Discoverers has carried a 10-pound Oscar (Orbiting Satellite Carrying Amateur Radio), designed and built by "ham" operators to investigate radio propagation phenomena.

For manned military operations in space, a pilot must be able to return from a wide range of earth orbits, maneuver within the atmosphere, and land at a suitable base. The Air Force, with the assistance of NASA, is developing an experimental delta-winged, multi-orbit, piloted space glider, the X-20 Dyna Soar. Prototypes of most of the X-20 subsystems are in various stages of testing. The Air Force and NASA are also working closely to achieve the capability for rendezvous in space. (See also SPACE FLIGHT.)



USAF: WIDE WORLD: WIDE WORLD

Test pilots (*above*) were chosen in 1962 to fly the space glider X-20, shown (*left*) in artist's conception. (*Right*) Air Force Maj. Robert White flew the suborbital, rocket-powered X-15 to a record altitude of almost 59 miles on July 17.

Reserve Forces.—The 1962 strength of the Air National Guard (ANG) and the Air Force Reserve (AFRes) dropped well below that of June 1961 because about 21,700 recalled Guardsmen and about 5,600 AFRes members recalled to duty in late 1961 were still on active duty on June 30, 1962. On that date, the number in the Ready Reserve was 253,795, as compared with 284,766 a year earlier. The new figures included 51,863 in the ANG and 201,932 in the AFRes. Standby reserve strength fell from 265,593 to 184,766.

The mobilization reduced the aircraft inventory of the reserve forces as well as its personnel. Aircraft in the ANG inventory numbered 1,216 on June 30, 1962, or 783 below the total a year earlier; the AFRes inventory fell to 704, or 99 less than the previous year.

Air Force Academy.—The U.S. Air Force Academy graduated its fourth class on June 6, 1962, and, with the admission of the 750 members of the class of 1966 later in June reached its full authorized strength of 2,512 cadets. More than 800 graduates of the academy are now serving as Air Force officers.

Flight Safety.—The following summary indicates the improvement in every aspect of flying safety in 1962 as compared with 1961: major accident rate per 100,000 flying hours, 5.8 (compared with 6.3); major aircraft accidents, 390 (440); aircraft destroyed, 294 (306); and fatalities in accidents, 296 (347). There were 118 aircraft accidents in which one or more persons were killed (122), and 13 midair collisions (16).

Personnel Strength.—Air Force military manpower increased because of the 1961 Berlin crisis, rising to 884,025 on June 30, 1962, from 821,151 a year earlier. The 1962 figure included 134,908 officers and warrant officers and 749,117 airmen, of whom 3,310 officers and 22,385 airmen had been recalled from the reserve forces in October and November 1961. Approximately 26,200 officers and 193,100 airmen were stationed overseas on June 30, 1962. The number of direct-hire civilians rose from 303,376 to 306,181.

Budget.—The Air Force budget request for the fiscal year 1963 sought $19.757 billion in new obligational authority, including $831 million for military construction. The Department of Defense appropriation bill passed by Congress in August 1962 gave the Air Force $19.390 billion, and a separate bill provided $866.8 million for military construction.

ALABAMA

A South Central state of the United States, Alabama ranks 29th among the states in area (land, 51,060 square miles; inland water, 549) and 19th in population (3,358,000 on July 1, 1962, a 1.1% increase from the 1960 census figure of 3,266,740). Urban places with populations above 15,000 in 1960:

Anniston	33,657	Huntsville	72,365
Auburn	16,261	Mobile	202,779
Bessemer	33,054	Montgomery (*capital*)	134,393
Birmingham	340,887	Opelika	15,678
Decatur	29,217	Phenix City	27,630
Dothan	31,440	Prichard	47,371
Fairfield	15,816	Selma	28,385
Florence	31,649	Talladega	17,742
Gadsden	58,088	Tuscaloosa	63,370
Homewood	20,289		

Government.—Chief executive and judicial officers in 1962 included John M. Patterson (Democrat), governor, serving a four-year term; Albert Boutwell, lieutenant governor; Mrs. Bettye Frink, secretary of state; Mrs. Agnes Baggett, treasurer; Mrs. Mary Garner, auditor; MacDonald Gallion, attorney general; W. A. LeCroy, superintendent of education; and J. Ed Livingston, chief justice of the seven-member Supreme Court.

The Alabama Legislature, which convenes in odd-numbered years, in 1962 comprised 35 Democrats in the Senate and 106 Democrats in the House of Representatives.

Legislation, 1962.—On June 12, after a United States district court threatened to reapportion the Alabama Legislature, Governor Patterson convened a special legislative session. Just before the date for a court hearing on the matter, the Legislature passed two reapportionment measures. One was a constitutional amendment, subject to ratification by the voters of the state, giving one senator to each county and changing representation in the lower house by taking one representative from each of 19 smaller counties and increasing the representation of Jefferson County from 7 to 17, of Mobile County from 3 to 8, and of four other counties from 2 to 3.

The other measure was a "stand-by" statute, to take effect only if the constitutional amendment failed to be ratified. It redefined some senatorial districts to eliminate extreme disparities, thereby admitting 27.6% of the population to control of the Senate instead of 25.1% as previously. For the lower house, the statute took 12 members from smaller counties and gave them to larger counties. Both of these measures were subsequently declared unconstitutional by the district court (see below, *Events, 1962*).

The session also enacted 92 general laws and 42 local or special laws, most of which dealt with routine governmental affairs. A constitutional amendment was proposed to permit voting in Alabama after only one year of state residence. This and four amendments concerning government finances were ratified in the November elections.

Finance.—In the 1961 fiscal year, revenue of $466,415,885 included $275,812,953 from state taxes and $145,733,224 in federal funds. Chief tax yields were the 3% general sales tax ($91,483,082), taxes on motor fuels ($74,314,287) and individual incomes ($25,792,139), and licensing ($20,969,722). Spending of $673,874,905 included $239,417,478 for education, $112,676,173 for health, welfare, and safety, and $131,558,344 for highways.

Education.—In the 1960–61 school year, public elementary schools staffed by 15,625 teachers enrolled 469,233 pupils; 12,302 teachers taught 204,142 junior high school and 125,957 senior high school pupils; and private and parochial schools reported 1,248 teachers and an estimated 25,506 pupils. College enrollment (fall 1961) totaled 47,967 in 5 junior colleges and 22 senior colleges and universities.

Public school spending in the 1961–62 school year (National Education Association estimates) totaled $206,370,000, including current expenditures of $185.7 million ($250 per pupil) and capital outlays of $19 million. Revenue of $209 million was drawn chiefly from state funds ($128 million) and local districts ($58 million). Teachers' salaries averaged $4,435 (high school, $4,630; elementary, $4,275). State expenditures for higher education (1960–61) totaled $52,876,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 138,593 persons totaled $94,058,182. This amount included $74,578,468 for the aged and $11,366,189 for dependent children.

Transportation and Communications.—Approximately 1,175 miles of highway construction and reconstruction were completed in the 1962 fiscal year. Highways and roads as of Dec. 31, 1961, totaled 65,550 miles (27,773 paved). These served 1,309,167 motor vehicles (as registered during fiscal year 1962), including 1,025,876 automobiles. Operating in the state were (1961) 27 railroads (using 5,071.14 line miles of track) and (1962) 5 regularly scheduled airlines and 92 commercial and municipal airports.

Communications media included (1962) 115 AM and 20 FM *radio* stations; 7 VHF and 5 UHF *television* stations; (1961) 20 daily *newspapers* (circulation, 686,925); and (Jan. 1, 1962) 247,200 business and 691,100 residential *telephones*.

Labor Force.—The state's labor force in July 1962 included 97,200 agricultural workers. Nonagricultural employment totaled 936,700, compared with 945,100 a year earlier and an average of 946,400 for the 12 intervening months. Of nonfarm employees, 25% were in manufacturing, 17.2% in government services, and 15.4% in trade. Unemployment in July 1962 stood at 67,500, compared with 86,200 a year earlier.

Manufacturing.—Manufacturing engaged 229,337 workers in 1960, including 187,513 in production, and provided a payroll of $982,403,000. Adjusted value added by manufacture totaled $1,961,767,000. (See also below, *Events, 1962.*)

LEADING ALABAMA MANUFACTURES, 1960

Industry group	Total employees	Total payroll (in thousands)	Adjusted value added by mfr.[1] (in thousands)
Primary metals	39,249	$241,697	$472,032
Textile mill products	38,999	124,938	223,923
Food and kindred products	19,169	73,169	185,477
Chemicals and products	8,141	41,036	157,278
Paper and allied products	10,824	62,637	134,058
Apparel and related products	24,929	59,616	113,633
Transportation equipment	12,880	69,856	107,895
Fabricated metal products	12,388	60,031	105,038
Rubber and plastics products	6,023	36,916	102,518
Lumber and wood products	22,200	51,061	87,903
Stone, clay, glass products	8,132	32,844	85,461

[1] For definition, see footnote 1 in the article *Industrial Production.*
(Source: *1960 Annual Survey of Manufactures.*)

Mining.—In 1961, Alabama ranked 20th among the states in the value of its mineral output, with 1.18% of the national total. It was third in output of asphalt, bauxite, iron ore, and scrap mica. Production of coal and iron ore and the manufacture of cement accounted for 73% of the value of minerals produced in 1961. Total employment in the industries declined 3% due to decreases of 11% at coal mines and of 18% at metal mines.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $340,769,000, compared with $301,138,000 for the corresponding period of 1961. For the full year 1961, income comprised $301,849,000 from livestock, $212,478,000 from crops, and $19,540,000 in government payments. Principal income sources in 1961 were cotton lint, $103,534,000; broilers, $87,532,000; cattle, $85,319,000; and eggs, $44,732,000.

ALABAMA MINERAL PRODUCTION, 1961

(In short tons, except as noted)

Mineral	Quantity	Value
Cement:[1]		
Portland (376 lb. bbl.)	12,445,000	$ 39,027,000
Masonry (280 lb. bbl.)	2,006,000	6,156,000
Clays[2]	1,787,000	2,068,000
Coal	12,915,000	90,903,000
Coke	3,949,927	83,340,000[3]
Iron ore, usable (long tons)	3,597,000	20,510,000
Iron, pig	3,584,637	202,946,000[3]
Lime	579,000	6,871,000
Petroleum, crude (1,000 bbl.)	6,932[4]	19,063,000[4]
Sand and gravel	5,800,000	6,452,000
Stone[5]	13,651,000	19,909,000
Other minerals	...	7,923,000
Total	...	$214,411,000[3,6]

[1] Excludes certain cement; value included in "Other minerals." [2] Excludes certain clays; value included in "Other minerals." [3] Values for processed materials are not included in the total. [4] Preliminary. [5] Excludes certain stone; value included in "Other minerals." [6] Total adjusted to eliminate duplications in value of clay and limestone used in cement and lime. (Source: U.S. Bureau of Mines.

The state's 116,000 farms in 1959 had an acreage of 16,543,000 (13,715,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,689,000 cattle, 933,000 hogs, 9,516,000 chickens, and (1961) 198,146,000 commercial broilers. An average of 109,000 family and 33,000 hired workers engaged in farming during 1961.

ALABAMA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Corn for grain (1,000 bu.)	44,097	48,335	35,235
Cotton lint (1,000 bales)	773	617	695
Cottonseed (1,000 tons)	310	254	283
Peanuts (1,000 lb.)	188,626	207,475	196,950
Potatoes (1,000 cwt.)	2,430	2,264	2,482
Soybeans (1,000 bu.)	2,172	3,504	3,040

(Source: U.S. Department of Agriculture.)

Events, 1962.—Former Circuit Judge George C. Wallace of Barbour County was elected governor of Alabama in the November 6 elections. Candidates committed to support the national party recovered control of the state Democratic Executive Committee from a "States Rights" faction of the party. Incumbent U.S. Sen. Lister Hill narrowly won reelection in the face of an all-out effort by the Republican Party to establish a two-party system in the state. Hill defeated Republican James B. Martin by about 6,000 votes, a margin of only 1.6% of the total ballot.

In a suit brought by Birmingham citizens for legal relief from legislative malapportionment, a federal district court postponed decision until after July 16 to give the state a last chance to reapportion itself. Ensuing measures adopted by a special session of the Legislature were ruled constitutionally inadequate and void (see above, *Legislation, 1962*). The court then, on July 21, ordered election to the 1963 Legislature held on the basis of the arrangement of senatorial districts provided for in one of the invalid acts (the stand-by measure), and the distribution of representation in the lower house formulated in the other.

The court's action, based on the U.S. Supreme Court decision of March 26 (see LAW), was the first of its kind in the nation. Emphasizing that the remedy ordered was provisional in nature, the court retained jurisdiction of the case for further judicial relief should the next Legislature fail to complete fair reapportionment. The legislative realignment—the first in Alabama in 61 years—required a special Democratic primary, which was held on August 28. (See also REAPPORTIONMENT AND REDISTRICTING.)

The state's worst racial difficulties of the year occurred in Birmingham. Officials closed the city's parks in January after a federal court enjoined their segregated operation. Birmingham Negroes conducted a campaign of selective buying to combat employment policies of some businesses; and the city government retaliated against Negro demands for civil rights by withdrawing relief funds for distributing food to needy families. Birmingham voters decided in a November referendum to replace the city's commission form of government with a mayor-council plan.

Year-end reports on business developments in Alabama during 1961 disclosed 246 new or expanded industrial installations, representing new capital investment of $218 million and providing 8,998 new jobs. Reports for the first six months of 1962 listed 139 new plants and expansions costing $49.7 million and creating 7,586 new jobs. Department store sales and consumer credit indicated retail business continuing to reach record highs in the state. Alabama remained the largest tree-farming state with 6 million acres in 2,000 farms, and an estimated 4,000 forestry-allied businesses. The George C. Marshall Space Flight Center at Huntsville reached an employment level of 25,000, with an annual payroll of $200 million.

After racial strife erupted in the fall at the University of Mississippi, trustees of the University of Alabama declared that similar events would not be tolerated on the Alabama campus.

"Legislation" and "Events" by: C. DALLAS SANDS, *Professor of Law, University of Alabama.*

ALASKA

Northernmost of the states of the United States, Alaska was admitted to the Union on Jan. 3, 1959. Known as "The Great Land," it ranks first in area and last in population among the 50 states. Its most southerly point on the Canadian boundary lies approximately 535 miles by air from the 48 conterminous states, and its westernmost point on the Seward Peninsula is separated from Siberia by the 55-mile-wide Bering Strait.

Area.—Alaska's area of 586,400 square miles (land, 571,065; inland water, 15,335) includes the many islands of southeastern Alaska in the Alexander Archipelago, Kodiak Island, the Aleutian Islands, the Pribilof Islands, Nunivak Island, and St. Lawrence Island. The Aleutians extend some 1,200 miles westward from Alaska's mainland.

Population.—The state's population on July 1, 1962, was estimated at 246,000, an increase of 8.7% over the 1960 census figure of 226,167. Included in the population are approximately 16,000 Eskimos, 14,000 Indians, and 4,000 Aleuts.

The population is a young one: 45% of the people are under 21 years of age, and only 2.4% are 65 years of age or older. The birth rate is 31.7 per 1,000 population, and the death rate is 5.4, compared with 23.4 and 9.3 per 1,000 for the rest of the United States. In 1960 there were 132.3 males to 100 females, compared with 97.1 males to 100 females in the United States as a whole.

Government.—Chief executive and judicial officers in 1962 included William A. Egan (Democrat), governor, serving a four-year term; Hugh J. Wade, secretary of state; George H. Hayes, attorney general; Robert Isaac, commissioner of education; and Buell A. Nesbett, chief justice of the three-member Supreme Court.

The Alaska State Legislature, which convenes annually, comprised 13 Democrats and 7 Republicans in the Senate in 1962, and 23 Democrats and 17 Republicans in the House of Representatives.

Legislation, 1962.—The second session of the 1961–62 legislature, which lasted 80 days, approved an operating budget of $69.4 million for the fiscal year 1963, along with supplemental appropriations of $7.7 million. Among the measures approved were the creation of a new Department of Industrial and Economic Development; codification and revision of the laws relating to criminal and civil procedures; and an antidiscrimination provision for free and equal enjoyment by all persons, regardless of race, color, or creed, of accommodations, amusements, conveyances, and business establishments.

In matters affecting education, the lawmakers took the first steps toward establishing a foundation program for state support to independent school districts; approved sabbatical leaves for public school teachers; and made the bachelor's degree a teaching prerequisite in state schools. The legislature also adopted a plan whereby each high school in Alaska will send one student annually to observe a session of the legislature for a one-week period. All

expenses will be paid by the legislature, and the student writing the best paper on the legislature will receive a one-year scholarship at the University of Alaska.

Successful labor legislation provided for payment of time-and-a-half for overtime work, and an increase in the minimum wage to 50 cents above the prevailing federal standard. (The cost of living in Alaska remains higher than in the other states.) Salary increases amounting to about 5% were granted to state employees, and the sum of $500,000 was appropriated to aid depressed areas.

Finance.—In the 1962 fiscal year, revenue of $106,900,737 included $35,161,271 from state taxes and $30,115,501 in federal funds. Chief tax yields were individual income ($12,212,269), corporate income ($1,769,150), motor fuels ($6,070,994), and licensing ($3,700,981). Spending of $114,216,020 included $26,816,159 for education, $17,012,347 for health, welfare, and safety, and $21,370,060 for highways.

Of the total receipts, general fund revenues for the fiscal year 1962 accounted for $71,882,195, an increase of $29,715,994 over those of the previous fiscal year. Receipts from bonus bids for oil leases totaled $21,335,301, compared with $1,727,423 in 1960–61.

Education.—In the 1961–62 school year, public elementary schools staffed by 1,589 teachers enrolled 50,226 students; secondary schools with 637 teachers enrolled 10,115; and private and parochial schools with 101 teachers enrolled 2,009.

Operating expenditures totaled $25,472,566 ($565.67 per pupil), and capital outlays amounted to $6,317,275. School revenue was drawn chiefly from state funds ($12,635,256) and local districts ($6,878,994). Teachers' salaries averaged $7,346.25.

Public higher education is furnished by the University of Alaska on its campus at College, near Fairbanks, and through its facilities at military bases and at community colleges in Anchorage, Juneau, Ketchikan, and Palmer; and by Alaska Methodist University in Anchorage and Sheldon Jackson Junior College at Sitka.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 6,816 persons totaled $3,883,855. This amount included $1,678,000 to dependent children and $1,157,440 for the aged.

Transportation and Communications.—Because of limited surface transportation facilities, the state relies heavily on air service for internal and external transport of passengers, mail, and freight. Fifteen regularly scheduled airlines were operating in the state in 1962 (four of them providing jet service from the Pacific Northwest), in addition to many bush pilots. There were approximately 319 commercial and municipal airports.

With 169 miles of new highway construction completed in 1961, roads and streets as of August 1962 totaled 4,283 miles (1,223 miles hard-surfaced). These served 86,311 motor vehicles (1961 registration), including 72,269 passenger cars. State and federal spending for highways in 1961 totaled $22,406,635. The single rail line, Alaska Railroad, connects Seward and Whittier with Fairbanks over a mainline track of 470 miles.

Communications media included (1962) 14 AM radio stations and 2 FM stations, 5 VHF television stations, (1961) 6 daily newspapers (circulation 53,514), and 7 other newspapers (circulation 10,039).

Labor Force.—The state's labor force in March 1962 totaled 70,300. Nonagricultural employment totaled 51,400, compared with 49,600 a year earlier and an average of 55,500 for the calendar year 1961. Of nonfarm employees, 43.8% were in government, 15.2% in wholesale and retail trade, and 14.2% in transportation and communications. Unemployment in March 1962 stood at 10,500, compared with 10,800 a year earlier.

Manufacturing.—Lumber and pulp production and the processing of seafood are the chief manufactures. In 1961 there were 370 manufacturing plants in the state, engaging 5,144 workers and providing a payroll of $40,085,628. A total of 2,440 persons, earning $17,424,564, were employed in seafood processing, and 1,616, earning $14,131,690, were engaged in logging and in lumber and pulp mills.

There were 91 fish canneries in 1961. Approximately 159,456,486 pounds of fish, valued at $106,798,688, were canned, chiefly 3,211,962 cases of salmon, valued at $99,352,358 (up 36% from 1960).

Fisheries.—Total value to fishermen of the fish and shellfish catch of 1961 was $46,469,600 (up 12% from 1960). Salmon, of which the state is the nation's leading producer, totaled 264,814,300 pounds valued at $35,740,710. Alaska is also the nation's leading producer of halibut (33,477,400 pounds; $4,887,810) and king crab (43,411,600 pounds; $3,913,700). Other important species are shrimp, herring, and dungeness crab.

Mining.—Mineral output in 1961 was valued at $36,566,000 (an increase of 62% over the previous year), accounting for 0.19% of the national total and ranking Alaska 41st among the states. A sharp rise in the value of petroleum and natural gas production, almost 13 times that of 1960, was responsible for the overall increase. Alaska ranked first among the states in platinum production, and third in mercury and gold. On Dec. 31, 1961, 1,695 persons were employed in the mineral industries.

ALASKA MINERAL PRODUCTION, 1961

Mineral	Quantity	Value
Petroleum, crude (barrels)	6,325,000	$17,647,000
Coal (short tons)	737,000	5,868,000
Sand and gravel	...	5,200,000
Gold (troy ounces)	114,000	3,997,000
Mercury (76-pound flasks)	4,129	817,000
Natural gas (Mcf.)	434	105,000
Other minerals, including lead, platinum, stone, and uranium	...	2,018,000

Agriculture.—About 10% of the food requirements of Alaska are supplied by its own farmlands, located chiefly in the Matanuska and Tanana valleys. They covered 888,331 acres in 1960, of which 15,591 acres were in harvested cropland. The total 1960 value of all farm land and buildings was $17,125,321 (average value per farm, $46,663). Of the 367 farms, 90% had electricity and 53% had telephone service.

Cash farm income in 1960 comprised $3,114,800 from livestock and livestock products and $1,257,600 from crops. The total value of forestry products in 1961 was $48,000,000.

Events, 1962.—For the second time in three years, Alaskan voters were asked to decide whether the state capital should remain in Juneau or be moved to the Anchorage area. This issue, which has aroused a good deal of controversy, first arose in 1960 when voters defeated an attempt to effect the transfer. In 1962 a new initiative petition was filed with the secretary of state, providing that the capital be moved, beginning in 1968, to a site in western Alaska no closer than 30 miles to Anchorage. In the general election the second initiative was defeated by a vote of 31,933 to 26,324, with a majority vote against the move in all districts outside of Anchorage. Democratic incumbents Gov. William A. Egan, Sen. Ernest Gruening, and Congressman Ralph Rivers were re-elected. The lower house of the Alaska Legislature has 20 Republicans and 20 Democrats, but the Senate is Democratic by a big margin.

In April the state became involved in an international incident when Governor Egan directed the seizure of two Japanese catcher boats, part of a commercial herring fleet, in Shelikof Strait. Alaska claims jurisdiction over the strait, which separates Kodiak Island from the mainland, on the ground that it constitutes an inland body of water. The matter was settled when the Japanese agreed to halt fishing operations in this area.

The three 500-passenger and 100-car ferries which will provide daily service in southeastern Alaska were launched during the year and are scheduled to begin operations in the spring of 1963. The vessels will connect Prince Rupert, British Columbia, with cities in southeastern Alaska and points as far north as Haines and Skagway. Jet air service was instituted in the spring between Seattle, Wash., and Fairbanks, Anchorage, and Juneau.

Economic developments included the discovery of new beryllium ore deposits on the Seward Pen-

insula, about 70 miles northwest of Nome. A rush of prospectors to the site was touched off by news of the find, made by U.S. Geological Survey engineers. Construction began in June on a $10 million oil refinery, located about 70 miles south of Anchorage. In the face of declining production of other minerals, the nascent petroleum industry is considered to be a very important factor in the future of the state's economy. (See also above, *Mining.*)

A $6 million psychiatric institute was dedicated by the state in August. The new facility is located in Anchorage.

The big game harvest in 1961 was the greatest in Alaskan history. Not including marine mammals and bears, the record bag contributed about 12 million pounds of meat to the state's larders, or an average of 45 pounds per capita.

I. J. MONTGOMERY,
Certification Supervisor,
Alaska Department of Education.

ALBANIA

A Balkan country of southern Europe, the Albanian People's Republic has an area of 10,629 square miles and a population (July 1, 1961 est.) of 1,660,000. The capital is Tiranë (Tirana; 1961 est. pop., 150,000). Albanian is the official language; Ghegish and Toskish dialects are spoken in the north and south, respectively.

Government.—A Communist-type people's republic since Jan. 11, 1946, Albania is ruled by the Albanian Party of Labor (Communist Party), headed by Enver Hoxha, first secretary of its Central Committee. The nominal head of state is Haxhi Lleshi, president of the Presidium of the People's Assembly, the unicameral legislature which is elected every four years by universal suffrage. In the elections of June 3, 1962, the 214 candidates for the Assembly on the single-list ballot of the Communist-led Democratic Front received over 99.99% of the vote (see below *Events, 1962*). Mehmet Shehu, premier since 1954, was called upon on July 14, 1962, to head again the Council of Ministers.

Education and Religion.—School enrollment, 1960: about 300,000 (about 56% of the school-age population). Number of schools (with enrollments), 1959: 2,685 primary (211,546); 35 secondary (5,177); 36 technical (6,842); 12 teacher-training (3,062); 2 higher (1,943). Principal religions: Islam (Sunni and Bektashi), 70%; Greek Orthodox, 20%; Roman Catholic, 10%. Since August 1951 the Albanian Catholic Church has been separated from Rome. The world headquarters of the Bektashi sect is located in Albania.

Finance.—Government revenue, 1962 est.: 29,000 million leks (24,650 million in 1961); expenditure, 28,510 million leks (27,700 in 1961). The lek is equal to U.S.$0.02. It is estimated that 69.5 billion leks will be invested in the third 5-year plan (1961–65).

Transportation and Communications.—Transport networks (miles, 1960): railroads, 106; roads, 1,677. The merchant marine totaled 11,000 tons in 1961. It was announced in December 1961 that a joint-stock shipping company would be organized by Albania and Communist China. The airport at Tiranë is served by Soviet, Hungarian, and Czechoslovak airlines. Radio sets numbered 43,000 in 1959.

Agriculture.—Over 43% of the population is engaged in agriculture. It was announced on Feb. 27, 1962, that 86% of the cultivated soil was collectivized, compared with 14.5% in 1955. Chief crops (metric tons, 1958): wheat, 101,000; rye, 9,000; corn, 160,000; barley, 7,000; oats, 13,000; cotton seed, 13,000 (in 1960). It was announced that agricultural production in 1961 totaled 4.9 billion leks more than in 1960.

Manufactures and Minerals.—About 38% of the population is engaged in manufacturing, mining, and other industry. Production (metric tons, 1960): lignite, 300,000; crude petroleum, 603,000; sugar, 14,000; cotton yarn, 900 (1959); chrome ore, 201,252 (1958); copper, 88,406 (1958); woven cotton, 24 million meters (1959); electric power, 175 million kw.hr. (1959).

Foreign Trade.—Total exports, 1959: 1,700 million leks; imports, 4,350 million leks. Principal exports: crude petroleum, bitumen products, chrome ore, blister copper, tobacco leaf, wine, medicinal plants. Chief imports: oil and mining equipment, industrial machinery, coke, fertilizers, paper and cardboard, fabrics. Chief customers and suppliers: USSR, Czechoslovakia, East Germany, Poland. Communist China's share of Albania's trade was expected to rise from 28% to 59% in 1962. Despite the worsening political situation with the socialist countries of eastern Europe, trade agreements were concluded in 1962 with East Germany, Czechoslovakia, Bulgaria, Hungary, Rumania, and Poland. In addition to increasing its trade with Communist China, Albania sought in 1962 to increase its trade with North Korea, North Vietnam, Cuba, Ghana, Iraq, Yugoslavia, and Austria.

Events, 1962.—Albania's relations with the Soviet Union, broken in December 1961, remained strained throughout 1962. Following the Soviet lead, Czechoslovakia, East Germany, and Hungary broke off diplomatic relations in late December 1961. The evacuation of the Soviet submarine base at Vlonë (Valona) was completed in 1962. Russian technical and economic experts that were withdrawn following the rupture of friendly relations were replaced by experts from Communist China.

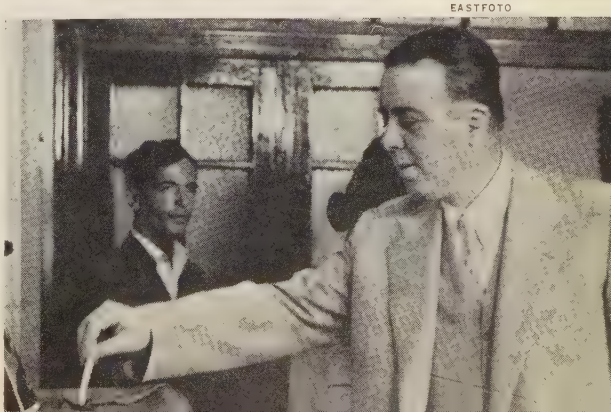
During the year Soviet propaganda organs attacked the Albanian government and the Albanian Communists as dogmatist, separatist, and deviationist. On January 9, *Zeri i Popullit* (*The Voice of the People*), organ of the Albanian Communist Party, declared its loyalty to the memory of Stalin and attacked Soviet Premier Nikita Khrushchev as anti-Marxist. On March 5, Albania's Communists paid tribute to the memory of Stalin and attacked Khrushchev as a revisionist, and accused him of seeking a modus vivendi with the United States at the expense of the revolutionary movements of Africa and Latin America.

Having lost its political allies in eastern Europe, Albania sought to establish more friendly relations with Austria, Italy, and Greece. In June about 40 Greeks, who were abducted by Greek Communist guerrillas during the Greek civil war and sent to Albania, were repatriated. Albania called on Greece to declare that the state of war existing between the two countries since 1940 is over, without Albania's having to sign a peace treaty with Greece. On June 13, a trade and cultural agreement with Ghana was ratified.

Premier Shehu claimed in a speech before the People's Assembly in July that gross industrial production was 71% higher in 1961 than in 1957. From 1950 to 1961, he said, national revenue increased by an annual average of 9.1%. The State Planning Commission report for the first half of 1962 indicated that the industrial production plan had been fulfilled by 102%, with significant increases from 9% to 32.8% in the production of chrome ore, iron, copper, coal, and spare parts. Milk consumption increased 9.7%; rice and beans, 13.3%; soap, 17.4%, textiles, 7.4%, and footwear, 5.7%. Nevertheless, there were serious shortages of consumer goods, especially foodstuffs, despite the aid received from Communist China. According to the third 5-year plan, 69.5 billion leks will be invested in development projects, a sum equal to the combined investment in the first and second 5-year plans.

Enver Hoxha, head of the Albanian Communist Party, casts his ballot in the Albanian parliamentary election, June 3.

EASTFOTO



In the parliamentary elections held in June (see also above, under *Government*) the government claimed that out of a total of 889,868 persons, only 47 did not vote for the government party. This compared with 37,000 dissenting in 1946, 11,573 in 1950, 959 in 1954, and 311 in 1958.

Earthquakes occurred on March 18 in central and southern Albania, resulting in five persons killed and 77 injured. About 2,700 houses were damaged, and about 1,000 others were rendered uninhabitable.

G. G. ARNAKIS,
Professor of History, University of Texas.

ALBERTA

Canada's fourth largest province, Alberta covers an area of 255,285 square miles, of which 6,485 square miles are water. It is bounded by Saskatchewan on the east, British Columbia on the west, Montana on the south, and the Northwest Territories on the north.

Population.—The population according to the 1961 federal census was 1,331,944; by national origin (1951 census) it was 48% British, 17% American, 11% German, 9% Ukrainian, 7% Scandinavian, and 5% French. Principal urban centers are Edmonton, the capital (281,027), Calgary (249,641), Lethbridge (35,454), Medicine Hat (24,484), Red Deer (19,612), Grande Prairie (8,352), Camrose (6,939), and Wetaskiwin (5,300).

Government.—The lieutenant-governor is appointed by the Canadian government to administer the province. He is advised by the Legislative Assembly of 65 members, 13 of whom are members of the Cabinet or Executive Council. J. Percy Page was lieutenant-governor in 1962, and Ernest C. Manning was premier. The Social Credit Party, which came to power Aug. 22, 1935, was returned with 61 seats in the provincial election of June 19, 1959. The province is represented in the federal Parliament by 17 members elected to the House of Commons, and by 6 appointed Senators.

Finance.—Estimated revenue for the 1962–63 fiscal year was $354,981,520; expenditure was estimated at $354,920,430. Alberta's debt at the beginning of the fiscal year was listed as $23,042,853. A debt reorganization program calls for complete retirement of debt by 1973.

Education.—There are 4,174 school districts grouped in 59 school divisions or counties; in addition there are 179 city, town, village, rural, and separate school districts. Classrooms numbered 10,741 in 1961, and school enrollment totaled 294,435. The Department of Education also maintains a correspondence school branch with an enrollment of 11,177 for the benefit of those without organized school facilities in Alberta and the Northwest Territories. There are 53 recognized private schools with 6,237 pupils. Teacher training is supervised by the Faculty of Education at the University of Alberta in Edmonton. The university offers degrees in the arts and sciences. The Southern Alberta Institute of Technology is located at Calgary, and schools of agriculture are administered by the Alberta government at Olds, Vermilion, and Fairview.

Transportation and Communications.—Alberta is served by three railway systems—the Canadian National, the Canadian Pacific, and the Northern Alberta Railway; five major airlines provide passenger and freight service to the United States, the Orient, Europe, and all other parts of Canada. Of Alberta's highways, 3,663 miles are now paved. The telephone system is owned and operated by the province, except at Edmonton. Most rural telephone lines are operated by mutual companies.

Production.—The value of field crop production in 1961 was $442.7 million, an increase of $35.9 million over the previous year. The value of livestock production was up almost $20 million from 1960, to $225 million. Slaughtering and meatpacking constitute the largest industry, with a production value of $156.6 million in 1961.

The value of mineral production in 1961 was $463.7 million, of which $44.3 million was from natural gas sales and $354.7 million from the sale of crude oil. Natural gas production totaled 497,925,000 Mcf., with production of petroleum totaling 157,650,000 barrels. Total value of lumber and forestry products in 1961 was $21.3 million.

Manufacturing.—The gross value of goods manufactured in Alberta in 1961 amounted to an estimated $942 million, showing a continuing upward trend. Most significant gains were shown in the food and beverage group, with production totaling $382 million; chemicals and allied products, $65 million; and paper products, $40 million. Manufacturing employs more that 40,000 persons.

Trade and Commerce.—Oil, natural gas, petrochemicals, and products of the petroleum industry are sold for local consumption as well as for export to other sections of Canada and to the United States. Lumber products and fish are also exported to United States markets. Retail trade during 1961 amounted to $1,384 million; wholesale trade, $862 million.

Events, 1962.—An announcement of major economic importance to Alberta in 1962 was that the Oil and Gas Conservation Board had recommended that permission be given to an applicant firm to proceed with development of the Athabasca Oil Sands. In a 20,700-square-mile area about 280 miles north of Edmonton lie the oil sands, estimated to contain the world's largest single oil deposit. Reserves are estimated at 100 billion to 250 billion barrels, and production should be under way within four years.

Development of the vast mineral, forest, and agricultural wealth of Canada's north will move closer to reality with the construction of the Pine Point Railway between Grimshaw and Great Slave Lake, which is expected to be completed in 1964.

H. E. MARTIN,
Director of Publicity and Advertising, Department of Industry and Development, Province of Alberta.

ALGERIA

The Republic of Algeria, situated on the Mediterranean coast of Africa, attained independence from France on July 3, 1962, after a cease-fire agreement concluded on March 18 had ended the seven-year war in Algeria between French and Algerian Moslem forces. The new nation has an area of 917,537 square miles and comprises the former delegation-general of Algeria, previously administered as a part of Metropolitan France with a special status, and the former Departments of the Sahara, previously under the French minister of state.

According to a 1960 census estimate, the population of Algeria proper was 10,197,000, and of the Saharan Departments, 588,000. The total population of 10,785,000 included a large majority of Moslem Arabs and Berbers, about 1 million Europeans (80% born in Algeria), mostly French, and some 125,000 native Jews. In the first ten months of 1962, however, about 750,000 Frenchmen and other Europeans left the country for France. Algerian Moslem refugees residing in Morocco and Tunisia in early 1962 numbered about 250,000, most of whom returned to Algeria by the end of the year.

The Algerian flag has a red star and crescent inscribed on a field consisting of equal halves of white and green, the latter being located on the staff's side.

Government.—The last French delegate-general (civilian and military governor) in Algeria was Jean Morin (appointed Nov. 23, 1960), who served until the Algerian peace settlement took effect on March 19, 1962. Christian Fouchet was French high commissioner for Algeria from that date until Algeria's independence was formally proclaimed on July 3. Sovereignty over the former French departments of Algeria was then transferred to the temporary 12-member Algerian Transitional (Provisional) Executive, which had been installed on April 7; this body exercised official authority until September 25. The separate Algerian Provisional Government, political executive or cabinet of the rebel National Liberation Front (FLN), transferred its own authority on August 7 to a new 7-member Political Bureau, led by Ahmed Ben Bella. The Political Bureau selected the candidates who were elected unopposed in national elections of September 20 to the 196-member National Assembly. Ben Bella was elected premier by the Assembly on September 26. The parliamentary body of the rebel FLN is the 54-member National Council of the Algerian Revolution, which along with the FLN executive body, the Political Bureau, continued in existence after formation of the new Algerian government. (See also below, *Events, 1962.*)

Education.—About one fifth of the school-age population attends school. School enrollments by educational levels, 1960: primary, 839,100; secondary, 81,282; technical, 34,722; and teacher-training, 1,675. The University of Algiers had 7,537 students in the 1960–61 academic year.

Finance.—The governmental budget for 1960 was balanced at 2,689 million new francs; the 1962 budget was estimated at 5,439 million (the new Algerian franc, introduced in 1960, equals 100 old francs; 4.937 new francs equal U.S.$1). France provided about 25% of Algeria's budget revenues in 1960, and also supplied about 70% of expenditure for industrial development under the Constantine Plan (1959–63), which cost an estimated 5,500 million new francs in 1962.

Transportation and Communications.—Transport networks (miles, 1959): railways (mostly state-owned), 2,610; roads, 34,387, including 5,460 miles of national highways. Merchant marine tonnage (1960): 72,953. The port of Algiers handled 21.5 million metric tons of freight in 1960. French airlines operate scheduled services to Algiers and Oran. Motor vehicles: 245,000 (1960); telephones, 195,123 (1960); radios, 600,000 (1961); television sets, 62,000 (1961).

Agriculture.—About 70% of the population is engaged in agriculture. Chief cereal crops and 1961 estimated outputs: wheat, 633,000 metric tons (1,505,000 metric tons in 1960); barley, 15.0 million bushels (39.0 million); and oats, 1.5 million bushels (3.4 million). Other agricultural products (metric tons, 1961): wine, 1,313,600 (exported); oranges, 254,000; vegetables, 69,400 (exported); dates, 18,500 (exported); olive oil, 18,000; and tobacco, 3.7 million pounds. Livestock numbers (1961): sheep, 5,360,000; cattle, 623,000.

Manufactures and Minerals.—General index of industrial production (1953 = 100): 161 in 1961 (163 in 1960). Principal manufactures (1961): electric power, 1,358.1 million kw.-hr. (up 4% from 1960); cement, 1,071,700 metric tons (up 1%); rugs and carpets, 407 metric tons. Chief minerals (metric tons, 1961): petroleum, 14,484,000 (up 65% from 1960); iron ore, 2,867,200 (down 16%); calcium phosphates, 425,300 (down 22%); and zinc ore, 70,900 (up 8%).

Foreign Trade.—Total exports, 1961: 1,814 million francs (down 7% from 1960); imports, 5,057 million (down 19%). Chief exports (in million francs, 1961): wine, 937; citrus fruit, 135; iron ore, 108; and fresh vegetables, 50. Chief imports: machinery, vehicles, metal products, petroleum products, and other manufactures. In 1961, France took about 81% of Algeria's exports, and provided about 82% of imports.

Events, 1962.—The seven-year war in Algeria between French forces and Algerian Moslem rebels was ended on March 18 with the signing of a truce accord by representatives of France and the rebel National Liberation Front (FLN) at Évian-les-Bains, France. The long conflict, which had begun on Nov. 1, 1954, had resulted in at least 194,000 deaths on both sides and had cost an estimated $20 billion in war expenditure and property damage. Total casualties included an estimated 141,000 rebels killed, 20,000 French Army troops killed and missing, and 32,837 Moslems and Europeans killed and missing as the result of terroristic acts.

Peace negotiations were conducted in secret at Évian-les-Bains from March 7 to 18 and, earlier, from February 11 to 18, at Les Rousses, France, where a preliminary agreement was reached that was later approved by the French government and by the FLN cabinet and National Council. The official cease-fire in Algeria went into effect on March 19.

Terms of the true agreement represented a compromise between the views of the French government, which wished to preserve sovereignty over the Sahara and firm ties between France and Algeria, and those of the Moslem rebels, who desired complete independence. The accord provided for an independent Algeria with close links to France, depending on the outcome of a self-determination referendum to be held within three to six months. According to the agreement, armed hostilities were to cease immediately, prisoners on both sides would receive amnesty, and France was to withdraw her military forces by stages over a three-year period. A transitional executive under a French high commissioner was to be established to rule during the interim period prior to independence, and French citizens resident in Algeria after independence were to be considered "French nationals exercising Algerian civil rights." France was to retain its existing mining rights in the Sahara, but would share equally with the new Algerian government the future exploitation of oil deposits and other minerals there. It was also agreed that Algeria would lease to France for 15 years the air and naval base at Mers-el-Kébir, and France would retain for five years its airfields and nuclear and rocket testing installations in the Sahara.

As was expected, ultranationalist Europeans who had insisted that Algeria remain part of Metropolitan France bitterly opposed the truce accord. They were led by the illegal Secret Army Organization (OAS), a grouping of diehard French Army elements and European extremists estimated to number about 4,000 activists. The organization resorted to a campaign of terror in a last effort to prevent Algeria's independence. Early in the year, on January 4, the OAS proclaimed the "mobilization of all Algerians" to prevent a peace settlement, and OAS terrorists indiscriminately shot and bombed Moslems, as well as some Europeans, virtually every day in Algiers, Oran, and other large cities. The death toll from terroristic acts ranged from a few dead on some days to as many as 110 deaths on May 2, and totaled an estimated 5,450 deaths in the first half of the year.

The purpose of the OAS campaign of terror was to goad the Moslem masses into committing acts of reprisal against Europeans and thereby to cause the French Army to align itself with the OAS against the Moslems. The strategy failed when FLN leaders succeeded in restraining the mass of Moslems from seeking revenge against the European populace. The belief held by Europeans that the French Army would not employ force against them was shattered after OAS terrorists in Algiers fired on French troop units and killed 15 soldiers on March 23. This outrage proved to be a major miscalculation on the part of the OAS, for the French Army moved promptly to seal off the Bab-el-Oued quarter where the murders occurred and to arrest some 3,500 suspected terrorists. When a mob of European demonstrators attempted to march into the same quarter on March 26 and broke through a military cordon, French troops fired into the crowd, killing at least 70 Europeans. The tragic incident marked a turning point in the Algerian struggle by making clear that the French Army was resolved to preserve order and implement French government policies at all costs.

The OAS staged a general strike in Algiers and other large cities on the day the cease-fire took effect, and on March 28 declared an "all-out" war against French forces. The organization's continued assassinations and bombings, however, appeared to lose for it much of the sympathy it had previously commanded among officers of the French Army, in France itself, and within the French community in Algeria. In a national referendum of April 8, French voters overwhelmingly endorsed the truce accord, and the size of the affirmative vote—17,866,423 ballots as against only 1,809,074 negative votes—apparently convinced many European Algerians that they were fighting a losing battle in their efforts to prevent Algeria's independence.

The rabid OAS alone was still unconvinced, but the organization was weakened by the campaign waged against it by French authorities. French security forces captured Edmond Jouhaud, second-in-command of the OAS, in Oran on March 26, and Raoul Salan, former French general and the OAS commander, in Algiers on April 20. A

French military tribunal in Paris condemned Jouhaud to death on April 13 (the death sentence was later commuted), then sentenced Salan on May 23 to life imprisonment because of unspecified "extenuating circumstances." Despite the loss of its top leadership, however, the OAS continued to terrorize the Moslem population by means of sporadic assassinations of innocent victims, including many Moslem women and children.

French and Algerian Moslem authorities cooperated in implementing the peace agreement. A French diplomat, Christian Fouchet, was named French high commissioner for Algeria on March 19, and on April 7 he officially installed at Rocher Noir a 12-member Transitional Executive, consisting of nine Moslems and three Europeans, and headed by Abderrahmane Farès as president. The truce was observed immediately in rural areas, and French and Moslem rebel troops were regrouped in preassigned areas without incident.

As the date (July 1) set for the self-determination referendum approached, most OAS members seemed to realize that they were fighting for a lost cause, and their leaders declared a halt to the daily terrorism from June 1 to 6 while they held negotiations with Moslem leaders. After the negotiators failed to reach agreement the OAS resumed its "scorched earth" campaign on June 7 by blowing up public buildings in Algiers, Bône, Constantine, and Oran. New negotiations were then held in secret, and a truce agreement was announced on June 17 by Dr. Chawki Mostefai, an FLN leader and member of the Algerian Transitional Executive. The agreement called for public recognition of the OAS, a general amnesty for OAS terrorists, and European participation in forming new Algerian security forces. A cease-fire was proclaimed by the OAS in Algiers. Militant OAS leaders in Oran and Bône rejected the truce, but their attempts to renew terrorist activities collapsed. The political leader of the OAS, Jean-Jacques Susini, declared on June 27 that the truce was in force throughout Algeria.

In the self-determination referendum held on July 1, Algerians overwhelmingly chose, by a vote of 5,975,581 to 16,534, independence for Algeria in close cooperation with France. President de Gaulle formally proclaimed Algeria's independence on July 3, and transferred sovereignty over the former French departments of Algeria to the Algerian Transitional Executive. As of that date the office of high commissioner for Algeria was dissolved, and Jean-Marcel Jeanneney was appointed France's first ambassador to Algeria. The United States and other nations immediately recognized the new Algerian state.

Enthusiastic independence celebrations were held without incident in Algiers and other cities, but in Oran, the last stronghold of the OAS, jubilant Moslem crowds clashed with Europeans on July 5. At least 20 Europeans and 73 Moslems were killed in the violent fighting. The tragic outbreak was the final major incident of violence between Moslems and Europeans in Algeria.

The attainment of independence was of course a great victory for the Algerian Moslem nationalist leaders, but it was ironic that their moment of victory was marred by a bitter political conflict

(4) Algerian women cast their votes in referendum of July 1, which approved immediate independence for the country.

that brought their country to the verge of civil war. The political struggle was between two principal factions of the Moslem leadership, and its outcome decided which group was to lead Algeria after independence. One faction comprised those leaders who had actually fought the war in Algeria, and included guerrilla leaders of the National Liberation Army (ALN) and a majority of ministers of the Provisional Government of the Algerian Revolution, headed by Premier Benyoussef Ben Khedda. The other group consisted of Algerian nationalists who had lived outside of Algeria during the war, and included the general staff of the ALN stationed in Morocco and Tunisia, and those nationalist leaders who had been imprisoned in France. The latter faction was led by Ahmed Ben Bella, vice premier of the Provisional Government and one of five ministers who had been freed by France on March 18 after five years' imprisonment.

The political struggle was precipitated on June 30 when Premier Ben Khedda dissolved the general staff of the ALN. The chief of staff, Col. Houari Boumedienne, and Ben Bella immediately denounced the Provisional Government's action and refused to accept the military dismissals. Ben Bella returned to Algeria on July 11 and, with other dissident political leaders, announced on July 22 that a seven-member Political Bureau had been formed to supplant the Provisional Government. Negotiations between the rival political factions resulted in an agreement whereby the government accepted the authority of the Political Bureau, provided that the National Council approved the bureau's membership. The Political Bureau, dominated by Ben Bella and his supporters, assumed political power on August 7.

Civil war was threatened in late August and early September when fighting broke out between military forces supporting the rival factions. Many commanders of guerrilla units refused to accept the authority of the new Political Bureau and deployed their forces to resist the advance of the 45,000-man National Liberation Army (the name was later changed to National Popular Army), which poured into Algeria after independence from wartime bases in Morocco and Tunisia. After a major military clash occurred in Algiers on August 29, the Algerian people themselves took the initiative in preventing civil war; thousands of angry Moslems demonstrated in Algiers on August 31 and September 1 to demand peace and unity, and an end to the power struggle among their leaders. Bowing to popular pressure, the rival factions negotiated a cease-fire agreement on September 4, but more than 100 soldiers were killed in fighting that continued until September 6 in the Algiers area. Under the cease-fire accord, guerrilla forces supporting Premier Ben Khedda withdrew from Algiers, and Colonel Boumedienne led 4,000 troops of his National Popular Army into the city on September 9. The effect of the settlement was to establish Ben Bella's faction as the dominant political force in the country.

Ben Bella's leadership was later confirmed by the results of the national elections. His Political Bureau picked the official list of 196 candidates to stand unopposed for election to the Algerian Na-

tional Assembly. Premier Ben Khedda and 52 other persons who had opposed the actions of the bureau were purged from the list, although Belkacem Krim and Mohammed Boudiaf, members of the Provisional Government and opponents of Ben Bella, were permitted to stand as candidates. More than 80% of the electorate participated in the elections of September 20 and overwhelmingly approved the official list of candidates. The new National Assembly convened in Algiers on September 25 and elected Ferhat Abbas, former premier of the Provisional Government (which was officially dissolved as of that date), as its speaker. As expected, the Assembly designated Ben Bella as premier, and he formed an 18-member cabinet which was approved by the Assembly on September 29.

Premier Ben Bella defined the policies of his one-party, strongly centralized government as socialist in economic affairs, and "neutralist and nonengaged" in foreign relations. He declared that Algeria's immediate goals were to effect agrarian reform, initiate rapid industrialization, expand educational facilities, and cooperate with France on a basis of equality. Cooperation with the latter was assured by agreements concluded on August 28 that provided for French economic and financial assistance to the new nation, and for joint exploitation of mineral deposits in the Sahara. The new government, which is strongly anticolonialist and firmly endorses African nationalism, apparently aspires to play an important role in the Arab world; Algeria was admitted to the Arab League on August 16.

Despite his government's protestations of neutrality in the struggle between the free and Communist worlds, Premier Ben Bella displayed a rather ambivalent attitude during and after a visit in October to the United States, where he addressed the United Nations and witnessed Algeria's admission to that organization on October 8. He received a warm and friendly welcome from the United States government, and on October 15, during cordial discussions with President Kennedy, reportedly received general assurances of expanded United States aid. Ben Bella then paid a 24-hour state visit to Cuba, where he and Cuban Premier Castro issued a joint communiqué on October 17 that pledged Algerian support for the Castro regime and demanded United States withdrawal from its naval base at Guantanamo, Cuba. The latter development was interpreted as a gesture of gratitude by Ben Bella for Cuban aid rendered to the Algerian rebels and as a bid to retain the support of extreme left-wing elements in Algeria, but it also aroused speculation that Algeria may pursue an anti-Western and leftist course in international affairs.

After returning to Algeria, however, Ben Bella took steps which indicated that his government would not necessarily adopt pro-Communist and anti-Western policies. He declared on November 3 that the small Algerian Communist Party would have to submerge itself within the National Liberation Front because the nation could not afford to have more than one political party. The government officially banned the party on November 29. The National Assembly had previously rejected proposals by leftist deputies that the Assembly model itself on the pattern adopted by Communist countries.

The Algerian government also attempted to maintain good relations with France and other Western countries. Premier Ben Bella on November 9 called for revision of the peace settlement with France, and negotiations between Algerian and French representatives on their future relations were held in Paris late in the year.

The Algerian government faced great difficulties as the result of a severe economic slowdown during the year. In late 1962 more than one third of the labor force was unemployed; Algiers' port activity was reduced by about 20% from a year earlier; and much private capital had left the country. Because of the political upheaval, taxes had not been collected since March, and Algeria's balance-of-trade deficit continued to rise. The flight from the country of about three fourths of the French population had reduced the number of administrators, educators, technicians, skilled workers, and businessmen desperately needed by the new nation. The only bright spot in the gloomy economic picture was the normal output of the year's crop harvest, but there were still severe food shortages.

Despite the economic dilemma, however, the Algerian people and leaders, conscious of the tremendous obstacles they had overcome in their triumphant struggle to attain independence, looked forward with hope and confidence to their country's future.

ALUMINUM

Production of primary aluminum in 1961 amounted to 1,903,711 tons in the United States and 663,173 tons in Canada. Total United States production in 1962 was expected to exceed the previous 1960 record and to pass the 2 million-ton mark for the second time. Canadian production in 1962 was expected to be the second highest in history, about 5% higher than in 1961 but still 10% less than the 1960 record.

Industry Growth.—Consolidated Aluminum Company, a Swiss firm, in 1962 was building a 20,000-ton-capacity smelter on the Tennessee River near New Johnsonville, Tenn. Operations were scheduled to begin in 1963. The firm will become the seventh producer in the United States.

Another new producer, Aluminio, S.A. de C.V., started construction in 1962 of Mexico's first aluminum smelter at Veracruz. Partially owned by an American producer (Aluminum Company of America), the Mexican producer is expected to start operations at its new 22,000-ton-capacity plant in mid-1963.

Shipments and Markets.—Shipments of aluminum products to consuming markets by the United States industry in 1962, including imports, were expected to exceed 2.6 million tons for the first time. Total shipments were expected to top the previous 1959 record of 2,530,000 tons by more than 10%, and to be about 15% higher than in 1961.

The largest single market for aluminum in the United States in 1962 continued to be the construction industry, which accounted for 25% of total shipments in 1961. Approximately one of every four industrial and office buildings now uses aluminum curtain wall panels. The average new home contained more than 235 pounds of aluminum in 1962, compared with 50 pounds in 1950. Aluminum siding is the fastest-growing use for the metal in residential construction.

The transportation industry continued as the second largest market for aluminum in 1962, just as in 1961, when it accounted for 22% of total product shipments. Trailers of all types used in-

creasingly greater quantities of aluminum in 1962. The Alweg Monorail at the Century 21 Exposition and World's Fair in Seattle, Wash., employed aluminum car bodies to carry passengers from downtown to the fairgrounds. The automobile industry consumed a record quantity of aluminum in 1962. An average of 67 pounds of aluminum was used in 1962 model passenger cars, compared with less than 30 pounds in 1955.

The fastest-growing market for aluminum is the container and packaging field, which in 1961 accounted for 7% of total product shipments. The outstanding application in this field is the aluminum can, which is now used to package a variety of food products.

Exports.—The free world's largest exporter of primary aluminum in 1961 was Canada (487,000 tons), followed by Norway (160,900), France (136,500), the United States (128,300), and Cameroun (52,000). Leading free-world exporters of semifabricated aluminum products in 1961 were the United Kingdom (64,000 tons), Belgium-Luxembourg (57,000), West Germany (46,200), Canada (34,800), the United States (34,600), and France (30,400).

AMERICAN ACADEMIES AND ASSOCIATIONS. For organizations whose titles begin with the word American (except American Library Association, which is reviewed below), see SOCIETIES AND ORGANIZATIONS.

AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS. See LABOR.

AMERICAN LIBRARY ASSOCIATION

The American Library Association (ALA), an organization of libraries, librarians, trustees, and friends of libraries, is the oldest and largest national library association in the world. Its membership was over 26,000 in 1962 for the first time in its 86-year history. The second wing of the association's new headquarters building in Chicago neared completion at the end of the year. The International Relations Office (IRO) under an additional grant from the Council on Library Resources, Inc., increased its staff and intensified its efforts on behalf of libraries abroad.

Income.—The total income of ALA in 1961–62 was again more than $2,200,000, of which $500,000 was from membership dues, the remainder from endowment income and grants for special projects. The association received 55 such grants in 1962, the income from which was nearly $850,000.

Conferences.—The 81st annual conference was held in Miami Beach, Fla., June 17–22, with the theme "The Librarian and Society." The 3,527 registrants conferred the first honorary ALA membership in six years on John M. Chancellor in recognition of outstanding service to the adult education movement in public libraries. The midwinter business meeting was held January 29–February 3 in Chicago. Future conferences were scheduled for Chicago, July 14–20, 1963, and St. Louis, June 28–July 4, 1964.

Officers.—Officers installed at the end of the Miami Beach conference were: president, James E. Bryan, director of the Newark (N.J.) Public Library; first vice president and president-elect, Frederick H. Wagman, director, University of Michigan Library; second vice president, Edmon Low, librarian, Oklahoma State University Library. Arthur Yabroff, business director of the Detroit Public Library, continues as treasurer.

Membership Policy.—Following action of 1961 in amending the Library Bill of Rights, the membership, at the Miami Beach conference, adopted a strong statement on membership. In part, it declares that "The American Library Association holds that so long as one librarian is unable to make his full contribution to the library profession by reason of racial, religious, or personal belief, and so long as one individual citizen cannot realize his full potential as a useful member of society because of such artificial barriers, the welfare of the nation is diminished." Individual members are called upon "to work . . . so that discrimination . . . may cease and that all people may have equal access to the tools of learning." Chapters are required to certify that they have not denied the basic rights and privileges of membership to each member, and institutional members are urged "not to discriminate among users on the basis of race, religion, or personal belief. . . ."

Library Technology.—The Library Technology Project is engaged in improving and standardizing library supplies and equipment. In 1962 the project completed the development of a new and more economical system of recording the lending of library books. A 12-month study of photocopying equipment resulted in the publication of *Photocopying from Bound Volumes*, which evaluated such equipment for scholars and librarians. Microfilm reader-printers were evaluated and the report prepared for publication. Also completed and nearing publication were reports of the study of fire and insurance protection for libraries, and a systems study of catalog card reproduction systems. Work continued on an improved book-labeling system, while a new design for pamphlet boxes was offered to manufacturers. *The Testing and Evaluation of Record Players for Libraries* was published as the result of a testing program.

Publications.—In 1962 the ALA published: *Southwest Missouri Library Service, Inc.; Vocations in Biography and Fiction; Friends of the Library; Language of the Foreign Book Trade* (2d ed.); *American Library Resources, suppl. 1950–61; Films for Libraries; Subscription Books Bulletin Reviews: 1960–62.*

Awards, Citations, and Scholarships.—*For distinguished service to the profession.*—The Joseph W. Lippincott Award ($1,000 and a medal) for distinguished service to the profession was made in 1962 to David H. Clift, executive director of the American Library Association. The Melvil Dewey Medal for creative professional achievement of a high order went to Leon Carnovsky of the Graduate Library School, University of Chicago, in recognition of his long-standing achievements as editor, author, teacher, and consultant in bibliographical matters. The Clarence Day Award ($1,000 and a print), in recognition of outstanding accomplishment in encouraging the love of books and reading, was presented to Lillian H. Smith of the Toronto Public Library. Mrs. Raymond A. Young, trustee, State Library of Jefferson City, Mo., and S. L. Townsend of the Suwannee River (Fla.) Regional Library Board, received the annual Trustee Citations of Merit.

For outstanding achievement in special areas.—The Beta Phi Mu Award ($50) for distinguished service to education for librarianship was won by Mrs. Florrinell F. Morton, director of the Library School, Louisiana State University, for service to "the Board of Education for Librarianship and the Committee on Accreditation with distinction through the years in which the present standards and the program of accreditation were developed and implemented." Mrs. Alice Brooks McGuire, librarian, Casis Elementary School, Austin, Texas, won the Grolier Society Award ($500) for unusual success in stimulating and guiding the reading of children and young people. The Isadore Gilbert Mudge Citation for achievement in reference librarianship was presented to Mrs. Frances Neel Cheney, associate director, Peabody Library School, George Peabody College for Teachers, Nashville, Tenn. Wyllis Wright, librarian of Williams College, Williamstown, Mass. won the Margaret Mann Citation for significant professional achievement in the fields of cataloging and classification.

For published works.—The H. W. Wilson Company Library Periodical Award ($100) was presented to the *North Country Libraries*, a joint publication of the New Hampshire State Library and the Vermont Free Public Library. Mrs. Elizabeth George Speare won the 41st Newbery Medal for *The Bronze Bow* (Houghton), judged to be the most distinguished contribution of 1961 to children's literature. The 25th Caldecott Medal for the oustanding children's picture book of 1961 was won by Marcia Brown for her *Once a Mouse* (Scribner). A Scarecrow Press Award for library literature went to Sarah K. Vann for the outstanding contribution to library literature during 1961 for her *Training for Librarianship Before 1923.*

For study and special research.—The Dutton-Macrae Award ($1,000) went to Pennie Ellene Perry, librarian, Second Ward High School, Charlotte, N.C., to study the possible effects on the science achievements of students in high schools in which National Defense Education Act

funds have been used to improve science collections and services in the school library. The Grolier-Americana Scholarships ($1,000) for professional education of school librarians were made available to the Graduate School of Library Science of the University of Illinois and the University of Arizona, College of Education, for presentation to students of their choice. Mary E. Bogan of Saratoga Springs, N.Y., won the Frederic G. Melcher Scholarship for graduate study in the field of library work with children.

FORREST F. CARHART, JR.
Assistant Director, Library Technology Project, American Library Association.

AMERICAN LITERATURE

The death of William Faulkner (q.v.) on July 6, 1962, brought to a close a great career and marked the end of an era of unusual achievement in American fiction. With F. Scott Fitzgerald and Ernest Hemingway, Faulkner had led a resurgence to high levels of achievement not reached in American fiction since the time of Hawthorne and Melville. At the time of his death, the first citizen of Oxford, Miss., was generally regarded as the foremost American novelist of the 20th century, his claim to eminence firmly based on a personal style that was capable of power and beauty, a deep moral vision, and a solid body of work.

Faulkner's best fiction was laid in an imaginary northern Mississippi region which he called Yoknapatawpha County. The characters and events of this microcosm became familiar in a brilliant burst of creative energy beginning in 1929 with the publication of *Sartoris* and *The Sound and the Fury,* and continuing with *As I Lay Dying* (1930), *Light in August* (1932), *Absalom, Absalom!* (1936), *The Unvanquished* (1938), *The Hamlet* (1940) and *Go Down, Moses* (1942). In 1950, Faulkner was awarded the Nobel Prize for Literature.

The Reivers,[1] published shortly before his death, was one of the most successful of Faulkner's recent novels. The story of the adventures of a boy and two men who run off with one of Yoknapatawpha County's first automobiles, and are later involved with a recalcitrant racehorse, *The Reivers* is a funny but moving return to the earlier mood of *The Hamlet* and such memorable stories as *Was, Shingles for the Lord,* and *Barn Burning.*

The Novel.—The year produced an unusually large number of new works by established novelists, but on balance it was disappointing. Katherine Anne Porter's long-awaited *Ship of Fools* was finally published and spent much of the year at the top of the best-seller lists. Written in Miss Porter's polished and flawless prose, *Ship of Fools* is a perceptive allegory dealing with a group of travelers and their transatlantic voyage in 1932. Most of the reviews were complimentary, but some contained a suggestion of disappointment because Miss Porter was unable or unwilling to evoke sympathy for her uniformly unpleasant characters.

Among the successful novels published during the year were three by craftsmen of limited but steadily growing reputation. Edward Loomis, in *The Mothers,* told another of his unsentimental, tragicomic stories of ordinary people unwilling to accept the knowledge of their own mortality. Like his earlier books, *The Mothers* is written in a low key, but it is a finished work of art. J. F. Powers, known best for his short stories, portrayed with wit and compassion the struggles of a very human priest in *Morte D'Urban.* James Yaffe, in *Mister Margolies,* dealt sympathetically with a man doomed to be second-rate who is brought to face the bitter knowledge of his own inadequacies.

Among the younger writers of wide reputation, George P. Elliott showed a continuing development in *David Knudsen.* A moral drifter whose struggles to be honest with himself never quite succeed, Elliott's hero is portrayed with great skill and subtlety. Philip Roth, a former National Book Award winner, was less successful in his first novel, *Letting Go.* The title, unfortunately, aptly reflects the book's lack of control. Roth's fine satirical sense makes *Letting Go* intermittently amusing, but the author spins out at interminable length the slender story of three lifelike but very dull young people. In the end, Roth's impressive talent is unable to overcome the apathy the reader feels toward these characters and the problems they create for themselves.

A welcome note of humor enlivened several of the year's offerings. Vladimir Nabokov's *Pale Fire* was an extended lampoon of literary scholarship and other ornaments of our culture. Of broader appeal was Wright Morris' *What a Way to Go,* a wild and irreverent excursion into the world of love, lighter in tone than most of Morris' previous work but given distinction by his perceptiveness and his sense of the ridiculous. A quieter humor helped gain critical approval for *A Long and Happy Life,* by Reynolds Price, the most widely acclaimed first novel of the year. In subdued but sensitive prose, Price describes the coming-of-age of a charming girl who in getting her man must change more than she had realized.

Two novels about World War II deserve mention. Joseph Heller's *Catch-22* (1961) is a broad and hilarious satire given special force because the action is set against a realistic depiction of war. One of the most unusual books of recent years, *Catch-22* catapulted Heller into the front rank of American satirists. James Jones' new novel, *The Thin Red Line,* also incorporated humor into its story of the final days of the battle for Guadalcanal. Like Jones' earlier work, this novel received harsh critical treatment because of its emphasis on brutality and the horrors of war.

Topical political novels continued to throng the best-seller lists. In *A Shade of Difference,* Allen Drury changed his setting from the Capitol (*Advise and Consent,* 1959) to the United Nations, without changing his unfortunate propensity for making dull fiction out of exciting events. Fletcher Knebel and Charles Bailey imagined a military conspiracy to overthrow the United States government in *Seven Days in May,* and Eugene Burdick and Harvey Wheeler in *Fail-Safe* provided a graphic warning of accidental nuclear war.

The most controversial novel of the year was James Baldwin's *Another Country.* Many were repelled by its relentless emphasis on sex and its use of obscene language. At the same time, Baldwin's undeniable ability to make the reader share his anguish and his anger stamps him as a writer of rare power in an age accustomed in its fiction to the quiet Jamesian tone. Whatever his technical shortcomings, Baldwin at his best is probably the most powerful of the young American writers.

Short Fiction.—The most interesting books of short stories were produced by young writers. John Updike followed the success of *Rabbit, Run* (1960) with *Pigeon Feathers, and Other Stories.* Some of these are merely sketches, but in others Updike demonstrates a maturity of insight to match his considerable talent. As Arthur Mizener observed, "*Pigeon Feathers* is not just a book of very brilliant short stories; it is a demonstration of how the most gifted writer of his generation is

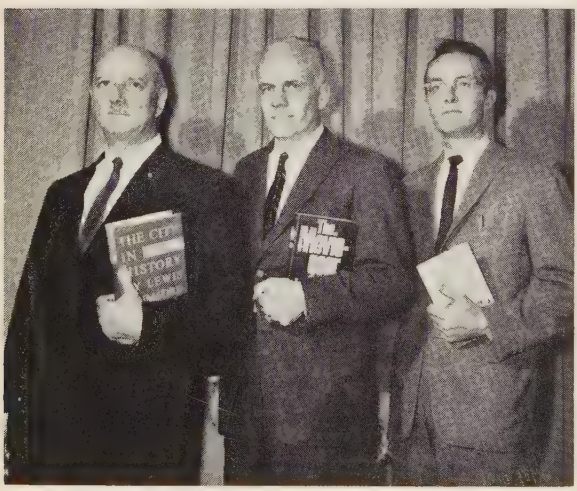
[1] Unless otherwise noted, all books mentioned in this article were published in 1962.

coming to maturity . . ." (*The New York Times Book Review*, March 18, 1962).

The development of another fine talent was demonstrated in Richard Yates' *Eleven Kinds of Loneliness*. Less fluent than Updike, Yates shows in this volume that he is no less perceptive and no less skilled at delineating the crucial moments in his characters' lives. In such a story as *Builders* he displays both compassion and insight.

Other volumes of interest included several by familiar figures. *The Pat Hobby Stories* do not show Scott Fitzgerald at his best, but they are amusingly and skillfully done, and they provide an interesting if melancholy sidelight on Fitzgerald's unhappy last years in Hollywood. Delmore Schwartz published *Successful Love and Other Stories* (1961); Mark Van Doren assembled the work of several decades in *The Collected Stories of Mark Van Doren;* and the critic Leslie Fiedler produced *Pull Down Vanity, and Other Stories*.

Poetry.—Robert Frost has indicated that *In the Clearing* is to be his final book of poems. If this proves to be the case, the book is an appropriate final statement by our most widely acclaimed living poet. The title reflects the mood of the book, in which Frost examines from the perspective of



NATIONAL BOOK COMMITTEE

Winners of the 1962 National Book Awards were: (from left) Lewis Mumford, *The City in History*, nonfiction; Walker Percy, *The Moviegoer*, fiction; and Alan Dugan, *Poems*, poetry. The awards were announced in New York on March 13.

age the paradoxes which have always concerned him. If these poems lack the lyric intensity which distinguishes Frost's most successful work, they are marked by a compassionate and mellow wisdom.

Waterlily Fire was a collection of the vigorous poetry of Muriel Rukeyser. Like many other modern poets, Miss Rukeyser is stylistically indebted to Whitman, but, as this volume shows, she has always succeeded in conveying her own deep concern for humanity. Among the work of other established poets, there were John Ciardi's entertaining and irreverent *In the Stoneworks* (1961), Horace Gregory's *Medusa in Gramercy Park* (1961), and a recreation by H. D. (Hilda Doolittle) of the myth of Helen and Achilles, *Helen in Egypt* (1961).

Younger poets also made important contributions. James Dickey's poems, in *Drowning with Others*, at their best have a moving intensity; at times, however, the poet strains to invent metaphors or becomes excessively abstract. Denise Levertov's handling of loose modern verse techniques was consistently skillful in *The Jacob's Ladder* (1961), confirming her as one of the most talented of the younger poets. Irving Feldman devoted himself to the theme of the Wandering Jew in *Works and Days, and Other Poems* (1961). Lawrence Ferlinghetti moved away from his earlier lyricism to a hard, concise style in *Starting from San Francisco* (1961), and Brother Antoninus (William Everson) produced more of his gnarled, Hopkins-like religious verse in *The Hazards of Holiness*.

Literary History and Criticism.—An unusual number of important critical works made their appearance in 1962. Outstanding among them were the second and third volumes of Leon Edel's exhaustive biography, *Henry James*, which shed new light on the writer's life between 1870 and 1895. This definitive study will alter many traditional ideas about James; its only drawback is Edel's sometimes excessive reverence for the work of the master.

The literature of the American Civil War received its most illuminating study in another work of major importance, Edmund Wilson's *Patriotic Gore*. Some reviewers quarreled with Wilson's introductory comments on the causes of war, but few had anything except praise for this distinguished veteran critic's analysis of the work of such writers as George Washington Cable, John William DeForest, and Harriet Beecher Stowe.

Mark Twain continued to be the subject of critical attention. Charles Neider collected and annotated 74 essays, sketches, articles, tales, and other material by the author in *Life as I Find It* (1961); Lewis Leary edited an interesting collection of essays by various critics, *A Casebook on Mark Twain's Wound;* and Henry Nash Smith produced a distinguished critical biography, *Mark Twain*. Edgar Allan Poe was the subject of an important work, *Poe: a Biography*, by William R. Bittner.

It was not surprising that, among 20th century writers, Hemingway, Fitzgerald, and Eugene O'Neill received special notice. Lillian Ross produced a *Portrait of Hemingway* (1961), while the same author's youth was described by two members of his family, Leicester Hemingway in *My Brother, Ernest Hemingway*, and Marcelline Hemingway Sanford in *At the Hemingways*. Andrew Turnbull's *Scott Fitzgerald* was a sympathetic narrative of a tragic life, biographical rather than critical in emphasis. Arthur and Barbara Gelb, in *O'Neill*, produced another of the currently fashionable infinitely detailed portrayals of tormented writers. This is a painful study of an unhappy man, but it has the virtue of showing sympathetically how O'Neill managed to come to terms with life through his plays.

Different forces in recent literature were studied in Daniel Aaron's *Writers on the Left: Episodes in American Literary Communism* (1961), a penetrating analysis of the interaction of literature and politics, and in Richard Foster's *The New Romantics*. The latter is a sometimes confusing discussion of the New Criticism, analyzing in detail the work of I. A. Richards, Eliseo Vivas, R. P. Blackmur, and Allen Tate in order to demonstrate the affinities of these men for the romanticism they have attempted to repudiate.

Several distinguished collections of essays were published, most notably Alfred Kazin's illuminating *Contemporaries*. Stanley Edgar Hyman was responsible for *The Tangled Bank: Darwin, Marx, Frazer and Freud as Imaginative Writers;* W. M. Frohock collected essays on Fitzgerald, Cozzens, Kerouac, Dickinson, Millay, and Pound in *Strangers to This Ground* (1961); and Kenneth Rexroth

produced *Assays*. A posthumous collection of essays by Isaac Rosenfeld was entitled *An Age of Enormity*.

History and Biography.—As the centennial moved into its second year, the Civil War continued to hold the center of the stage. Charles M. Segal accomplished the considerable feat of contributing something new to Lincolniana with his edition of *Conversations with Lincoln* (1961). Two new books helped refocus attention on the role of slavery in the prelude to the war: D. W. Dumond's *Antislavery: the Crusade for Freedom in America* (1961), and Basil Davidson's study, *Black Mother: the Years of the African Slave Trade* (1961). Harold M. Hyman brought to completion a biography begun by the late Benjamin P. Thomas, *Stanton: The Life and Times of Lincoln's Secretary of War*.

Two figures from the early years of the nation's history received considerable attention. Broadus Mitchell completed his two-volume study of the first secretary of the treasury with *Alexander Hamilton: The National Adventure, 1788–1804*, while H. C. Syrett and J. E. Cooke edited the third and fourth volumes of *The Papers of Alexander Hamilton*, covering the years 1782–88. William T. Hutchinson and W. M. E. Rachal edited the first two volumes of *The Papers of James Madison*.

The achievements and legacies of the 19th century "empire builders" were sympathetically studied in several books, including Richard O'Connor's *Gould's Millions*, John Tebbel's *The Inheritors*, and E. P. Hoyt's *The Vanderbilts and Their Fortunes*. The international involvements of the United States at the end of the last century were the subject of Ernest R. May's *Imperial Democracy: the Emergence of America as a World Power* (1961).

Our century's world wars accounted for a number of books. Among the most notable were Hanson W. Baldwin's concise and balanced account, *World War I: an Outline History*, and Roberta Wohlstetter's careful and reasonable study of a controversial event, *Pearl Harbor: Warning and Decision*. The dawning of the atomic age was the subject of *The New World, 1939/1946* (first volume of *The History of the U.S. Atomic Energy Commission*), by R. G. Hewlett and O. E. Anderson, Jr., and of Lt. Gen. Leslie R. Groves' *Now It Can Be Told: the Story of the Manhattan Project*.

Other Nonfiction.—One of the less spectacular but nonetheless dangerous threats to life on earth is the indiscriminate use of pesticides, according to Rachel Carson in *Silent Spring*. A well-documented account of how the balance of nature is being upset, this provocative book made an impassioned plea for curbing the use of harmful chemicals.

AMERICAN SAMOA

Lying between 13° and 15° south latitude and between 167° and 171° west longitude, American Samoa is an unincorporated insular possession of the United States. Its seven islands occupy an area of 76 square miles and have a population of 20,051 (1960 census). The largest and most populous island is Tutuila, on which is located the capital, Pago Pago, with its fine harbor. The other islands are Aunu'u; Ta'u, Olosega, and Ofu of the Manu'a group; Swains; and uninhabited Rose. Villages with over a thousand residents include Pago Pago, Fagatogo, Leone, and Nu'uuli. The people, who are Polynesian and part-Polynesian, are United States nationals. Their customs, when not inconsistent with United States or Samoan laws, are respected.

Government.—The constitution of 1960, effective on October 17 of that year, defines the organization of the government, which consists of a bicameral legislature, an executive, and an independent judiciary. The Code of American Samoa contains all locally promulgated laws.

The Legislature (or Fono) of American Samoa comprises a Senate of 15 members, elected in accordance with Samoan custom from among the chiefs, and a House of Representatives of a maximum of 24 members (17 voting members in 1962), publicly elected by secret ballot.

A governor and a secretary of American Samoa head the executive branch. Both are appointed by the United States secretary of the interior. The executive branch also includes departments of Legal Affairs and Public Safety (attorney general), Agriculture, Administrative Services (treasurer), Public Works, Education, Medical Services, Port Administration, and Local Government (secretary of Samoan affairs).

The judicial branch includes a High Court, with trial, probate, and appellate divisions (presided over by either the chief justice or the associate justice of American Samoa), and five district courts.

Budget and Finance.—American Samoa was granted $5,105,400 in federal funds for use in fiscal year 1962 ($2,648,125 in 1961), and in addition $4,943,400 was allocated as a deficiency budget, making a total of $9,429,950. Construction funds for 1962 rose to $6,917,780 ($1,306,800 for 1961).

Education.—School attendance is compulsory for all children of ages 7 to 15. About 99% of the total population of 10 years of age and over is literate. The villages provide the elementary school buildings (grades 1–6) and the living quarters for teachers, and the territorial government furnishes school buildings, teachers, equipment, and supplies for secondary schools.

In June 1962 there were 44 village elementary schools, seven junior high schools, a demonstration or model school, an elementary dependents' school, an elementary hospital school, a senior high school, a vocational high school, a teacher-training college, and a nursing school, as well as nine private parochial schools. Total enrollment was 7,023. Instruction is in English and in Samoan in the elementary schools, and only English in the secondary schools.

Public Health.—The government maintains a central hospital of 197 beds and a 22-bed leprosarium besides district dispensaries and a number of village public health nurses. American-trained physicians and nurses work with Samoan medical practitioners and nurses. Over 50,000 outpatient visits are made to the hospital clinics annually.

Transportation and Communications.—Pan American World Airways maintains weekly flights to and from American Samoa on its route connecting Honolulu with Nandi, Fiji, and Auckland, New Zealand. TEAL offers weekly service from New Zealand and Fiji to Samoa and Tahiti and return; South Pacific Airlines operates a biweekly service between Honolulu and American Samoa; and Polynesian Airlines, a Western Samoan company, operates daily flights between American and Western Samoa. Matson Lines and General Steamship Lines operate passenger liners and freighters from the United States to New Zealand and Australia via American Samoa. Interisland vessels maintain schedules with Western Samoa. The government operates the telephone system and a small radio station (WVUV). A newssheet in English is mimeographed five times a week, and the Samoan language weekly *Failauga Samoa* and the quarterly *O Le Fa'atonu*, in English and Samoan, are printed locally.

Production and Trade.—Essentially agrarian in economy, American Samoa has approximately 1,500 plantations ranging from 3 to 15 acres. Of the total 47,000 acres in the territory, 32,000 are capable of being cultivated for cash and subsistence crops, 8,000 for forest crops, and 7,000 acres are uncultivable. A total of 10,097 acres are cultivated or partially cultivated.

Subsistence crops consist of bananas, breadfruit, and taro. Other crops include papayas, pineapples, sweet potatoes, tapioca, coffee, cacao, and yams. Swine, cattle, and poultry are also raised. Green foods and processed foods are imported, the latter from the United States and New Zealand. Copra and cacao are the principal agricultural exports. A modern tuna-packing cannery, employing approximately 340 Samoans, is operated by a California concern.

Foreign trade for the 1962 fiscal year comprised imports valued at $4,856,055 and exports worth $7,773,834. Imports were mostly from the United States, Australia, and New Zealand. An increase in tourist travel has accelerated local and export sales.

Events, 1962.—Early in the fiscal year 1962 the governor outlined a 3-year rehabilitation program to strengthen and reorganize every phase of public service and encourage industry and commerce. The first phase of the program was accepted by the Congress, and a total of $9.5 million of federal

funds and $1 million in local funds was appropriated and made available by October 1961. The first year's program was concentrated on completing the following public projects necessary for the Fifth South Pacific Conference, held in Pago Pago in July 1962: a 9,000-foot jet runway; an 800-seat civic auditorium; a new power plant with two 1,000-kilowatt diesel electric generating units; 27 government housing units; 3 new high school buildings; 8½ miles of highway from the airport to downtown Pago Pago; complete renovation of many public buildings; and a general clean-up campaign.

The governor proposed an educational television system as a medium for elementary and adult education. With the completion of the new high school buildings and employment of 40 additional educational personnel, plans were made to enroll all qualified junior high school graduates in high school for the first time in the fall of 1962. Various medical and agricultural development programs also were instituted. In industrial development, a contract was signed for the development of a coconut-processing plant, creating jobs for about 100 persons, and negotiations were virtually completed for a second fish-canning company and an all-Samoan development corporation.

H. Rex Lee,
Governor of American Samoa.

ANDORRA

Located in western Europe between France and Spain, Andorra is an autonomous republic under the joint suzerainty of the president of France and the bishop of Seo de Urgel, Spain. It has an area of 175 square miles, and a population (1962 est.) of 10,000. Andorra la Vella (est. pop., 1,300) is the capital. The country is governed by a 24-member General Council of the Valleys; its president is Julian Reig Ribo. France represents Andorra in foreign affairs. Sheep raising and agriculture are the chief occupations; tourism (700,000 visitors in 1960) and smuggling provide additional sources of income. Andorrans speak Catalan and are of the Roman Catholic faith. French and Spanish currencies are in use.

ANTARCTICA

The 50th anniversary of man's first attainment of the South Pole was celebrated during Antarctica's 1961–62 austral summer season. On Oct. 30, 1961, in an official anniversary ceremony at the South Pole, a marble plaque was unveiled honoring the explorers Roald Amundsen and Robert Scott.[1] On it was engraved the names of the 10 men in their respective parties, followed by the inscription: "A Tribute from Great Britain and Norway—Presented to the U.S. Amundsen-Scott South Pole Station."

United States Research.—For the United States, the 1961–62 season was the most ambitious since the end of the International Geophysical Year (IGY) in 1958. All logistic and geographical programs were carried out by the Navy under Rear Adm. David M. Tyree, head of the U.S. Naval Support Forces, Antarctica. Investigations were performed by civilian scientists for the National Science Foundation (q.v.). In addition to annual ship and air logistic support for the main base at McMurdo Sound and for Hallett Station (shared with New Zealand), the Navy's VX-6 aviation unit resupplied the scientific stations at the South Pole, at Byrd, and a few smaller field stations. The Ellsworth Station off the Weddell Sea continued to function on a loan basis from the United States to the Argentine Navy, as did Wilkes Station, on loan to Australia.

Research groups from universities, private institutions, and branches of the government, working in a variety of basic research projects, were based during the austral summer at or near permanent stations from which their field forays originated. Aerial support provided the necessary maintenance for 42 field projects in such areas as glaciology, seismology, biology, geology, magnetism, and ecology.

A permanent research station was set up on Eights Coast at the base of the Palmer Peninsula. A seven-man team from the University of Wisconsin, equipped with three Sno-Cats (tracked vehicles), surveyed the area from the Eights Station and obtained many ground-control points for the first time since it was discovered and photographed on flights by the Ronne expedition in 1947. New seismic sounding data, added to that obtained in adjacent areas, seem to indicate that the huge trench which extends from the Ross Sea has a connection with the Filchner Ice Shelf and the Weddell Sea. The new discoveries suggest that the 2,000-mile-long Palmer Peninsula is the northern part of an enormous island, that the peninsula's base is far narrower than heretofore believed, and that as a result the Filchner Ice Shelf may rival the Ross Ice Shelf as the world's largest floating ice apron.

A U.S. Geological Survey team of five men flown to the eastern Horlick Mountains from Byrd Station found a 70-pound meteorite about 330 miles from the South Pole, the second ever found on the Antarctic continent. Antarctic meteorites are of special interest to scientists because they are a less common type, containing large proportions of nickel, iron, and silicate.

Byrd Station required by far the greatest aerial logistic effort because of the construction of the new station. Some 258 flights carrying 1,040 passengers and 3,000 tons of cargo were made between McMurdo and New Byrd. The old Byrd Station was evacuated on Feb. 13, 1962. The 36-man wintering group then moved into the nearby New Byrd Station, constructed in huge tunnels beneath the surface.

A comprehensive program in aerial photography was conducted in the Queen Victoria and Queen Maud Mountains, and field survey parties obtained indispensable ground-control points for making maps. Forty-four flights were made to the South Pole with 554 passengers and 540 tons of cargo. All flights were made with C-130 turbojet ski-equipped planes.

For the first time in history the atomic age reached the Antarctic. On March 3, 1962, the installation of an atomic reactor at the McMurdo Sound Naval Operating base was completed. After a period of tests, the nuclear power plant began delivering electricity to the base on July 10. With an output of 1,500 kw., it provides an assured source of energy that requires refueling only once every two or three years.

A total of 306 Americans spent the winter at

[1] On Dec. 14, 1911, the Norwegian Roald Amundsen's party of five men and 52 sled dogs reached the pole after sledging 840 statute miles in 55 days. On Jan. 18, 1912, a British team of five men led by Robert Scott arrived at the pole after traveling 940 miles in 76 days. Scott and his men perished on the return journey.

the four United States-operated stations, including four meteorologists each at Ellsworth and Wilkes stations and one biologist at the USSR's Mirny Station.

Research by Other Countries.—Great Britain has decided to change the name of its Falkland Islands Dependencies in the Antarctic, most of which is also claimed by either Chile or Argentina. Starting in 1962, the dependencies became officially known as British Antarctica. Great Britain, Chile, and Argentina continue to occupy their many bases on the Palmer Peninsula and adjacent islands.

From the British Halley Bay Station on the east coast of Queen Maud Land a small party surveyed a trail south to the Tottan Mountains. These mountains, which form the eastern boundary of the Filchner Ice Shelf, were first discovered by flights of an Argentine Army officer from General Belgrano Base in 1955.

Two Argentine naval aircraft landed at the South Pole on Jan. 6, 1962, after an 8½-hour flight from Ellsworth Station. The geographical coverage first made of this area by Capt. Finn Ronne in 1947 and again in 1957 was extended south about 200 miles to the South Pole. After a few hours stop for rest and refueling, the planes returned to Ellsworth where 30 men, including 3 American meteorologists and 1 physicist, continued the scientific recording program.

The Japanese expedition-ship *Soya Maru* returned to Tokyo in April after evacuating the party of 56 men from Showa base in Lützow-Holm Bay. This base had been occupied since its inception in 1956 for the IGY program. The wintering team, the largest ever sent by Japan, made an inland journey and discovered new mountains which were named Yamato Range. The Japanese plan to reopen their station in the 1963–64 season.

The South Africans were forced to evacuate Maudheim (leased from Norway) because of its deterioration, and built a new station a few miles away.

Besides the joint operation of Cape Hallett Station with the United States, New Zealand also conducts scientific work at Scott Station, three miles from the McMurdo Sound base.

The French continue to occupy their Dumont d'Urville Station in Adélie Land, using the Danish ship *Magga Dan* in the resupply mission.

Vostok, one of the permanent USSR stations, was converted to a seasonal base in 1962, and the seasonal station in Enderby Land was abandoned. In 1960 the temperature at inland Vostok Station registered −126.9°F., the lowest ever recorded on earth. In March 1962 it was reported that the USSR had established a new base, Molodezhnaya (Youth Station), on the coast of Enderby Land, and in October the Russians announced that both Vostok and Molodezhnaya would become permanent, year-round stations beginning in the 1962–63 season. At the two other permanently occupied USSR stations—Mirny (where there is an American observer) and Lazarev (Novolazarevskaya) on Princess Astrid Coast—routine scientific work is being conducted.

While resupplying the Mawson and Davis Stations of the Australian Antarctic Research Expedition, the supply ship *Nella Dan* was trapped in the ice 17 miles off the coast of Enderby Land for nine days before being freed.

Of the 12 Antarctic Treaty nations, Norway, Japan, and Belgium were without research stations on the continent during the 1962 austral winter season.

ANTHROPOLOGY

In 1962 there were demands for anthropologists to do a greater variety of jobs than ever before, especially in the areas of government and international relations. The announcement in January of plans to send Peace Corpsmen to a dozen more nations in Africa, Latin America, and the Middle East increased the need for anthropologists to conduct training programs, to consult on Peace Corps (q.v.) aims, and to accompany volunteers into the field. The Agency for International Development and the Pan American Union also sought the help of anthropologists.

At the national meetings of the American Anthropological Association, held in Chicago in November 1962, a session was devoted to consideration of the most efficient way in which to engage anthropologists in the work of the United Nations Educational, Scientific and Cultural Organization (UNESCO). Among prospective projects were the study of bilingualism and of the possibility of a world language; the comparative study of law; and a crash program of anthropological research in West New Guinea (q.v.). Most of that island's many people still have had no direct contact with the outside world, yet they are about to undergo rapid culture change as a result of their new political status. Within a single generation isolated village groups using stone tools have become participants in the world economy. New Guinea thus provides an excellent laboratory to test social science theories related to the study of newly developing nations.

As a further manifestation of the concern of anthropologists with international problems, the Social Science Research Council and the American Council of Learned Societies appointed a committee on contemporary China. The objective is to encourage research on the culture and society of China by cultural anthropologists; study also would include Chinese communities overseas and in Taiwan. Cornell University received a grant of $3,250,000 from the Ford Foundation to support its research on China, most of which is conducted by anthropologists.

Conflicts Arising from Urbanization.—The growing world problem of urbanization, resulting from the rapid increase in city populations, led to a proposal by anthropologists that UNESCO sponsor the study of the city of Chicago as typical of the highly industrialized areas which experience problems resulting from the influx of rural peoples of differing ethnic backgrounds. There the problem of assimilating Southern Negroes, Southern whites, Spanish-speaking people, European immigrants, and American Indians has led to many conflicts that need to be examined scientifically. The differences in values, behavior, and cultural expectations that lead to such conflicts would be studied both to help newly arrived city dwellers to adjust to urban culture, and to better understand the cross-cultural sources of misunderstanding and its relation to racial and religious prejudice in the United States and other countries.

Statement on Negroes.—Also related to the problem of race, attention in the nation's press was accorded an announcement by the American Anthropological Association repudiating statements appearing in the United States that Negroes are inferior to whites biologically and in innate ability. It reaffirmed "the fact that there is no scientifically established evidence to justify the exclusion of any race from the rights guaranteed by the Constitution of the United States. . . . All races possess the abilities needed to participate fully in the democratic way of life, and in modern technological civilization."

A Study of Poverty.—National attention also was directed to a book by Oscar Lewis, *The Chil-*

Antarctica's first nuclear-powered reactor, installed at McMurdo Sound by the U.S. Navy, began operating on July 10.

dren of Sanchez. This anthropological study of the members of a poverty-stricken Mexican family was acclaimed as one of the best books of the year. The moving account of the effects of grinding poverty on simple, decent people, and the way in which it gradually destroys them, will be the first serious anthropological work ever made into a popular motion picture film.

Discovery of Mastodon Remains.—Mexico was the scene of one of the important archaeological finds of the year. Cynthia Irwin of Harvard University uncovered the remains of a mastodon along with human artifacts approximately 30,000 years old. Scientists have known that early man hunted the mammoth and other large game, but this discovery provided the first evidence that the mastodon was also the prey of early Indians.

Anthropologists Honored.—The Annual Viking Fund Medal and Award of the Wenner-Gren Foundation was presented in 1962 to four anthropologists, who will divide the $10,000 prize. They are Professors Edward E. Evans-Pritchard of England, Robert von Heine-Geldern of Austria, Dr. Louis S. B. Leakey of Kenya, and Professor Sol Tax of the United States.

Meetings.—In addition to the annual meetings of the American Anthropological Association, other important scholarly meetings in 1962 involving anthropologists included the 35th International Congress of Americanists, held in Mexico City in August; and the 1st International Congress of Africanists, held at the University of Ghana in December.

ARABIA

A peninsula in southwestern Asia with an area of 1,180,280 square miles, Arabia is bounded on the north by Iraq and Jordan, on the east by the Persian Gulf and the Gulf of Oman, on the south by the Arabian Sea and the Gulf of Aden, and on the west by the Red Sea and the Gulf of 'Aqaba. Arabia includes three independent states—Saudi Arabia, Yemen, and Kuwait—and several other states and territories which are under some form of British domination, influence, or protection. The latter are the sheikhdoms of Bahrain and Qatar, the Trucial States or Trucial Oman (7 sheikhdoms), the Sultanate of Muscat and Oman, and Aden Colony and Aden Protectorate (including the Federation of South Arabia). In addition, there are neutral zones between Saudi Arabia and Iraq, and between Kuwait and Saudi Arabia. The total population of the peninsula is estimated at 13 million. (For components of Arabia not discussed in this article, see ADEN, KUWAIT, MUSCAT AND OMAN, SAUDI ARABIA, and YEMEN.)

Petroleum Resources.—In 1961, Arabia supplied about 20% of the crude oil produced in the free world. The estimated proved oil reserves in Arabia as of Jan. 1, 1962, were 126.5 billion barrels, and represented 40.8% of the world's reserves. The oil reserves (in millions of barrels, with percentage of world total in parentheses) were distributed as follows: Bahrain, 245 (0.1); Kuwait, 62,000 (20.0); Neutral Zone, 6,000 (1.9); Qatar, 2,750 (0.9); Saudi Arabia, 52,000 (16.8); and Trucial Coast, 3,500 (1.1). Total petroleum production in 1961 amounted to more than 3,300,000 barrels daily, and royalties in the same year approximated $1 billion.

The Arabian American Oil Company (ARAMCO) holds concessions to explore and exploit some 340,000 square miles in southern and eastern Saudi Arabia, as well as offshore areas in the Persian Gulf. ARAMCO is owned by Standard Oil Company of New Jersey, Standard Oil Company of California, and Texaco, Inc. (30% each), and by Socony Mobil Oil Company (10%). ARAMCO owns the Trans-Arabian Pipe Line Company (TAPLINE), which connects the main oilfields near Dhahran with the port of Sidon in Lebanon. A branch of TAPLINE supplies about 6,000 barrels daily to the El Zerqa' refinery in Jordan, a subsidiary of Ente Nazionale Idrocarburi (ENI) of Italy.

On the west coast of Saudi Arabia near Yemen, Società Anonima Navigazione Eritrea (SANE), wholly owned by the Italian government, in 1958 obtained a concession covering 13,000 square miles.

The Bahrain Petroleum Company, owned equally by Standard Oil Company of California and Texaco, holds the concession for all of Bahrain. The Gulf Kuwait Company, owned by the Gulf Oil Corporation, and BP (Kuwait) Ltd., owned by the British Petroleum Company, have the concession in Kuwait, except for offshore exploitation rights which are held by Royal Dutch Shell.

In the Neutral Zone between Kuwait and Saudi Arabia, equal concessions are held by the American Independent Oil Company (Aminoil) and the Getty Oil Company. Deep offshore rights are held by the Arabian Oil Company, a subsidiary of the

Japan Petroleum Trading Company, 10% of which is owned by Saudi Arabia.

Concessions in Qatar are held by the Qatar Petroleum Company, a subsidiary of the Iraq Petroleum Company (IPC), and offshore rights are held by the Shell Company of Qatar. Petroleum Development (Trucial Coast) Ltd., a subsidiary of IPC, owns the rights in Trucial Oman, except for offshore rights which are held by the British Petroleum Company (66.7%) and Compagnie Française des Pétroles (33.3%).

The concession for Muscat and Oman is held by Petroleum Development (Oman) Ltd., owned by Royal Dutch Shell (82.6%) and Participations and Explorations Corporation (17.4%), except for the concession in Dhofar, which is held by Dhofar-Cities Service Petroleum Corporation and Richfield Oil Corporation. Since 1960 the Pan-American Hadramaut Oil Company, a subsidiary of Standard Oil Company of Indiana, has held oil rights in Aden.

Bahrain.—This sheikhdom, under the rule of Sheikh Isa ibn Salman al-Khalifa (acceded 1961), consists of several islands in the Persian Gulf which are claimed by Iran. The total population (1961 est.) is 182,000. Manama, the capital (1959 pop., 61,837), is located on Bahrain (213 square miles), the largest island in the archipelago, after which the state is named.

By a treaty of 1820, Great Britain protects the sheikhdom and conducts its foreign affairs. The British political resident for the Persian Gulf resides in Manama, and British military headquarters are on the island of Muharraq, which has an international airport. In 1962 the British flag officer for the Middle East moved from Bahrain to Aden. There is little democratic government in Bahrain; three Bahrainis who agitated for the overthrow of the present sheikh's father in 1956 and who were imprisoned in St. Helena, were freed in 1961, and in 1962 each was awarded £15,000 compensation.

About 70% of the total income is derived from oil revenues, which average about $16 million annually. An underwater pipeline carries oil from Saudi Arabia to a refinery on the island of Sitra. The new port of Mina Salman was opened in 1962. It was constructed at an estimated cost of £4 million, and is considered to be one of the best equipped ports in the Persian Gulf region. It has an entrance channel which is 3.5 miles long and 27 feet deep.

Qatar.—This sheikhdom covers a barren peninsula in the Persian Gulf, and has an area of 8,000 square miles and an estimated mid-1961 population of 55,000. The capital, Doha (pop., 30,000), is the residence of the British political agent, who advises the sheikh (Ahmed ibn Ali al-Thani) under a treaty of 1916 guaranteeing perpetual peace with Great Britain.

In 1962, proved oil reserves totaled 2.75 billion barrels. Oil revenue in 1960 amounted to $65 million, three fourths of which went to the sheikh and his relatives. In 1961, Shell Company of Qatar brought in a new offshore oilfield at Idd al-Sharqi, about 52 miles east of Qatar. The older field is at Dukhan, and there is a small refinery at Umm Said, the chief port.

In 1962, Great Britain announced that the island of Halul in the Persian Gulf belonged to Qatar instead of to Abu Dhabi of the Trucial Oman. Qatar has 200 miles of paved roads and about 8,000 motor vehicles. The principal airport, at Doha, is served by the Gulf Aviation Company and by Kuwait Airways.

Trucial Oman or Trucial States.—These seven sheikhdoms cover an area of about 6,000 square miles south and east of Qatar along the Persian Gulf to Muscat and Oman. The largest is Abu Dhabi; the others are Dubai, Sharjah, 'Ajman, Umm al-Qaiwain, Ras al-Khaimah, and Fujairah. The aggregate population (mid-1962) is estimated at 110,000. In 1820, Great Britain agreed to protect the sheikhs, who in return agreed not to war against each other, raid shipping, permit slavery, or make any treaties with other powers—hence the name Trucial Oman. The British political agent resides at Dubai, the principal port.

Oil strikes were made in Abu Dhabi in 1960 by Petroleum Development (Trucial Coast) Ltd. at Murban and Umm Shaif, and deposits were estimated at 3.5 billion barrels. In 1962, oil tankers began loading oil at the island of Das, the terminal for the Umm Shaif offshore oilfields. About 30,000 barrels per day were produced from nine underwater wells. Until 1960 there were no oil revenues accruing to the sheikh of Abu Dhabi (Shakbut ibn Sultan ibn Said), but in 1962 they totaled over $20 million. The Eastern Bank and the Ottoman Bank have opened branches in Abu Dhabi, and in 1962 a new 25-room air-conditioned hotel was opened there.

Professor of History,
The Ohio State University.

ARCHAEOLOGY

Highlights in world archaeological research are summarized below in two sections: (1) Western Hemisphere; and (2) Eastern Hemisphere. For related information, see ANTHROPOLOGY and the Index entry, *Archaeology*.

WESTERN HEMISPHERE

The steadily expanding interest in archaeology in North America was well evident in 1962. Although many institutions dispatched parties to join in the salvage operations necessitated by the great Aswân High Dam project in Egypt, American field operations were not curtailed; and in some areas, as on the Plains, they were expanded.

United States and Canada.—Investigation of early man was carried out at two stratified open sites, one in Colorado and one in Wyoming, and at two cave sites in Idaho. In the Fraser Canyon, British Columbia, the earliest culture-bearing stratum has been dated at 7000 B.C., with overlying strata dated by the carbon-14 method at 6150 B.C. These have produced, in addition to chipped flint artifacts of early type, charred wild cherry pits; and nearby fossilized midden deposits, presumably as old, contain salmon bones.

Two new sites in New York State are reported to have produced fluted points and other characteristic paleo-Indian artifacts. Three other comparable sites are known in this general region—in Vermont, Pennsylvania, and Massachusetts. The last has been dated by radioactive carbon at about 7000 B.C., and the New York site may well be as old. Human bones found at a depth of 37 feet in water-laid deposits on Santa Rosa Island, California, were dated by carbon-14 at 8000 B.C. No artifacts were associated with these remains, which are believed to be an accidental burial at the edge of a former marsh.

Levels which may be referred to the Archaic period were present in the Colorado and Idaho sites mentioned above. Other sites yielding Archaic materials are reported from Lyon County, Kentucky, and from cave sites in Arkansas. A stratified rock shelter in Colbert County, Alabama, yielded a sequence beginning with shell-tempered Mississippian pottery in the upper levels. Lower levels carried the sequence through limestone-tempered and sand-tempered wares to the fiber-temper of the earliest ceramics of the area. Below this, and separated from it by a thin sterile zone, was an Archaic occupational level containing Dalton points and an assemblage of tools including uniface scrapers, gravers, and knives. Two samples of charcoal from this level have given dates of 7640±450 B.C. and 6920±400 B.C.

At Etowah Mounds, in Georgia, the excavation of Mound "C," begun in 1881 by Cyrus Thomas, was completed after 11 seasons of work by three institutions. Burials excavated from this mound total nearly 400. Noteworthy artifacts include a wooden plaque carved in a geometric pattern, a shell disc gorget with the design of a bird transfixed by an arrow, and a shell gorget which shows a human figure tied to a scaffold in the "Morning Star sacrifice" style. The major submound feature, a temple floor 111 feet long and 40 feet wide, was completely uncovered and an extensive submound trash pit was excavated.

Historic archaeology, which is rapidly expanding, continued its growth in 1962 and, in addition to the widespread field work, produced some excellent reports, among which may be mentioned those on the excavations of Fort Frederica, on St.

UNIVERSITY OF PENNSYLVANIA

Jade mask (r.) dated at 221 B.C., and pendant, 800 A.D., were taken from Mayan tombs in Tikal, Guatemala, in 1962.

Simons Island, Georgia, and on El Morro at San Juan, Puerto Rico. In 1962, Fort George, an early fur-trading post in South Dakota, was excavated, and a large collection of objects illustrating the life of the period was secured. In Florida, the early British "Negro" fort later reoccupied by Andrew Jackson as Fort Gadsden, on the lower Apalachicola River, was investigated to determine the fortification characteristics of the British fort (built about 1811). The ruin of the exploded powder magazine yielded a quantity of musket balls and a few other artifacts.

In Alabama, excavations were conducted to locate, if possible, the remains of the Prophets fortification at the Battle of Horseshoe Bend (1814), and to locate the extent and character of the Creek village of Tohopeka, in the Horseshoe Bend, and that of Nuyaka, across the river from the battlefield. It was found that erosion has been so extensive that no trace of the fortification could be found. Tohopeka, however, was located in agreement with contemporary maps, and the remains of Nuyaka were found approximately where contemporary sources described them. At the latter site a trash-filled pit yielded considerable quantities of cow, pig, and turtle bones, along with shells of, apparently, hen's eggs.

In California, the site of the original adobe structure built about 1839 by pioneer John Marsh on the north side of Mount Diablo in Contra Costa County was explored. Due to farming activities and road construction, few remains were found. In Georgia, the Highway Salvage Program resulted in excavation of sections of both Union and Confederate trenches on the Resaca battlefield. Excavation confirmed the historical records that during the Atlanta campaign Confederate entrenchments were substantial, while Union entrenchments were superficial.

Mexico and Meso-America.—Probably the most significant archaeological news of 1962 was announced at the 35th International Congress of Americanists in Mexico City, when the results of two years of intensive field work in the Tehuacán Valley (in the states of Puebla and Oaxaca) were reported. Here a primitive maize has been found associated with cultural materials in a dry rock shelter in Coxcatlán. It was announced that the stratum in which the cobs were found has been dated by the radiocarbon method at 3600±250 B.C. The area is now under organized attack on a multidisciplinary basis, with technical consultants from such fields as maize, cucurbits, local flora, palynology, textiles, and geology participating.

Large-scale surveys have been undertaken in this arid valley straddling the Puebla-Oaxaca border, and two more rock shelters have been extensively excavated. A tentative seven-phase cultural sequence has been worked out, covering a period of approximately 11,000 years. Of special importance is the great amount of plant remains recovered, preliminary analysis of which has thrown new light on Meso-American agricultural origins. The suggested plant appearance order for southern Puebla of squash, maize, gourd, pumpkin, bean, and amaranth, appears to differ from that worked out earlier for southern Tamaulipas, suggesting multiple origins for various basic Meso-American food plants.

Mammoth remains were excavated in 1962 in the Valley of Mexico, reportedly from the same geologic level as a nearby site which yields artifacts of an early type.

In northwestern Mexico, a notable find was the discovery of two reasonably well-preserved mummies in caves, one at Zape, the other in the El Rayo cave, Otinapa. A third mummy was later found by a treasure hunter in an unfired clay chest, near Apozol, Zacatecas.

In the Maya area, at Chichén Itzá, the project designed to complete the recovery of artifacts from the Sacred Cenote has been completed. Hundreds of objects were recovered, including bells of copper, tumbaga, and gold; pottery vessels; objects of wood, rubber, and fiber; human bones; copal incense; and jade. Just west of Chichén Itzá the Grotto of Balankanche has been completely investigated. Seventy large appliqued censors, over half of which bore Tlaloc faces, were the most striking of the more than 600 artifacts which had been ritually deposited in the underground chambers during the period of Toltec hegemony in northern Yucatan. This portion of the grotto, with most of the artifacts *in situ*, is to be made into an underground museum. A recent radiocarbon test dates the grotto assemblage at 931±90 B.C.

At the Altar de Sacrificios project in Guatemala, one of the most important developments has been the ceramic analysis of over 300,000 shards. This resulted in the setting up of a basic typology, based on the type-variety system, in which these shards were sequenced into eight local phases extending from the Late Preclassic to the Early Postclassic. In general these correlate closely with those of the classic Uaxactun sequence.

South America.—Individual field projects have continued in various South American countries, but only one large-scale coordinated project has been undertaken. Cornell University, in connection with its applied anthropological project of the study of change from the hacienda to independent land holdings, at Vicos near Huarás, Peru, began intensive archaeological investigations of the highland valley of Marcara. Deep habitation refuse in the Vicos plaza and dry rock shelter deposits in the vicinity have revealed occupation from the Early Formative Chavin period up to the modern Quechua Indians.

At Puerto Hormiga, near Cartagena, Colombia, the Instituto Colombiano de Antropologia discovered and excavated a ceramic-yielding site in which the majority of the pottery is tempered with fibers. Since this trait is early in the Western Hemisphere, a radiocarbon date of 2875±170 B.C., based on a shell sample, seems appropriate. Refuse at the site is principally shell, with some fish and turtle bone, and is arranged in a ring.

GEORGE METCALF,
Scientific Aide, Division of Archaeology, U.S. National Museum.

Eastern Hemisphere

From the viewpoint of the art historian and archaeologist, probably the most exciting discoveries in the year 1961–62 were made on the high plateau of southern Anatolia by Prof. James Mellaart of the University of Istanbul. His British expedition uncovered at Çatal Hüyük amazing colored frescoes dating from about the 7th to 6th millenium B.C., the oldest known murals made on building walls. The site, covering 32 acres, is larger than its correlate of Jericho, in Jordan. Many specialists believe now that Anatolia must be seriously considered as the original locale of settled life.

Europe.—Perennially active excavators in Britain uncovered Roman and Viking remains at York (Roman Eboracum), which was at its height of development in the 3d and 4th centuries A.D. Clues from Saxon and Norman manuscripts led to the additional discovery of a 7th century Saxon church in Winchester; and the remains of a Saxon great hall were found in London when workmen were excavating a storage tank pit adjacent to 10 Downing Street.

Sweden and Denmark were engrossed with ancient ships recovered from the sea. The 17th century Swedish warship *Vasa*, which sank ingloriously after two hours at sea, has been the focal point of preservation as a museum. Seven Viking ships dating from about 1,000 years ago were recovered by the Danes in a fjord north of Copenhagen. In Switzerland, silver objects dating from Roman times (the "Mildenhall treasure") were found near Basel.

As usual, Greece and Italy were the scenes of numerous discoveries, many of which were accidental finds. A University of Cincinnati expedition found a varied group of remains dating from the 3d to the 1st millenium B.C. on the Greek island of Ceos (Keos) in the Cyclades. Italian government archaeologists are excavating an Adriatic city that was the birthplace of the name Italia, first used there over 2,000 years ago by rebels against Roman rule. At Ostia Antica, near Rome, was found a synagogue believed to date from the 1st century A.D. and to be the oldest in western Europe. Underwater archaeology flourished off Sicily, where many treasure-laden cargo ships have been found.

At a Pleistocene dating symposium in England, it was revealed that the age of that geological period could be extended to between 2 and 3 million years, and that hominid fossils (found at Olduvai Gorge, Tanganyika, in 1959) may be as much as 1.75 million years old. Physical anthropologists view this revised dating as more commensurate with the time considered necessary for man to have evolved. (Another Pleistocene dating conference was organized in the United States. In addition, the Wenner-Gren Foundation for Anthropological Research, in New York, sponsored a symposium on salvage archaeology, a matter of worldwide concern.)

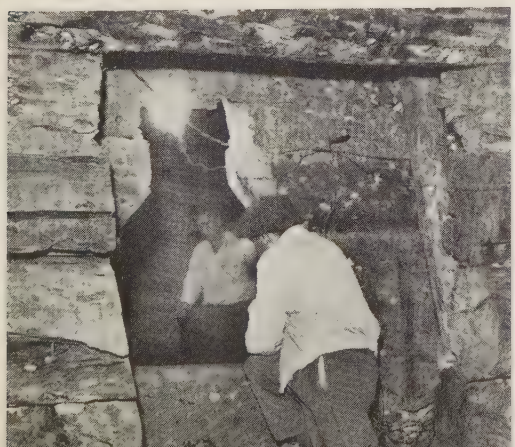
Western Asia.—Classical archaeological expeditions continued work in the Middle East, particularly in Turkey. A Harvard-Cornell expedition at Sardis uncovered a synagogue dating to about 220–250 A.D. Gorgeously decorated with marble and paved mosaics, it was tangible evidence of the importance of Jewish communities in civic affairs under Roman rule during the 3d century. New York University inaugurated its Anatolian Research Project at Aphrodisias in Caria, western Turkey. Aphrodisias was pre-eminent as an artistic, religious, and political center in Late Hellenistic, Imperial, and Byzantine times. Continuing researches under Prof. Rodney Young of the University of Pennsylvania at the burial mound of Gordion, a city of the 7th century B.C. southwest of Ankara, have disclosed climatological information. These data were traced from studies of the tree rings preserved in the tomb said to belong to King Midas. Beautiful carved ivories of Assyrian design dating about 700 B.C. were reportedly discovered by the Turkish archaeologist Tahsin Özgüç at the site of Kul Tepe.

In northern Iraq, British archaeologists continued to recover the vast horde of carved ivories in what seems to have been a military warehouse at Nimrud. Three seasons of work have failed to empty one of the huge rooms of its treasures. The finds date from about the 8th–7th centuries B.C. Iranian government archaeologists discovered an extraordinarily rich royal tomb at Marlik, just south of the Caspian Sea. Dating from about 1000 B.C., the finds included beautiful objects of gold and silver.

In Israel and Jordan, further finds have been made of early Christian Era documents around the Dead Sea. The University of Pennsylvania and the American School of Oriental Research are sponsoring excavations in Jordan. One of these is at the Biblical city of Gibeon, where a rich harvest of Middle Bronze Age artifacts was made. The other was at Biblical Shechem, where messages from the city's Egyptian overlord to the pharaoh were found. Prof. Kathleen Kenyon, of the University of London, began an ambitious project designed to reveal more about the history of Jerusalem. In Syria, government archaeologists have resumed the search for Samira, one of the most important

Changes in climate from 1500 to 700 B.C. were plotted by scientists who studied the pattern of growth rings in logs found in a tomb at Gordion, Turkey. (*Left*) Prof. Rodney S. Young of the University of Pennsylvania works in the tomb as his Turkish assistant watches. (*Right*) Small bowls contained food for journey to the other world. In background are bronze caldrons.

THE NEW YORK TIMES



Designed by Ulrich Franzen, H. D. Towers residence in Essex, Conn., was given merit award by American Institute of Architects.

A.A

Canaanite cities during the second millenium B.C.

Eastern Asia.—Chinese archaeologists discovered Neolithic and Bronze Age artifacts dating to 3,000 years near Shanghai. A capital used by the rich and powerful T'ang Dynasty (618–906 A.D.) and having a perimeter of 22 miles was found at Sian. In North Korea, two mural tombs of the Koguryo Dynasty (37 B.C.–668 A.D.) were uncovered. A significant discovery of Paleolithic implements, estimated to be about a quarter-million years old, was made on Kyushu, Japan. The most ancient tools in that country were previously estimated to be about 30,000 years old. Fossilized human skeletal remains found in a Philippine Islands cave are believed to represent the Proto-Malay type of ancient man.

One of the highlights of the congress of Americanists in Mexico was the revival of the controversial theory of Asian and Central American culture links via the Pacific. Supporters of this theory believe that there is evidence strongly suggesting cultural contacts between the pre-Columbian peoples of Central America and Indo-China, Thailand, China, and Japan. The so-called Aztec calendar stone, according to one of the experts, is a Chinese invention. Most of the arguments produced appear to be based on stylistic and artistic grounds. Many archaeologists are waiting for more conclusive proof of such contacts.

Africa.—In northern Africa, most archaeological work is being done at the site of the future Aswân Reservoir, which will straddle the border of Sudan and Egypt. Five Egyptian temples threatened with submersion by waters behind the Aswân High Dam have already been removed, and plans for safeguarding the huge temples of Abu Simbel and Philae have been completed. Funds needed for the latter work are being accumulated, but the salvage must start well in advance of the dam's first operational stage in 1964. British excavations north of Buhen in the Sudan have pushed back the known date of Egyptian contacts with Nubia to the 4th and 5th dynasties, 600 years earlier than formerly thought.

The Museum of New Mexico and Columbia University are continuing the prehistoric and geological researches begun by Columbia University in 1961–62 in northern Africa. Important findings of the latter expedition include a revision of those made by previous investigators in the area, and a refutation of the glacial-pluvial equivalence theory in this part of the continent. At Alexandria, Egyptian archaeologists are wondering how to recover the colossal statue of Poseidon, the Greek god of the sea, which once surmounted the now destroyed Pharos (lighthouse), built in the 3d century B.C. and considered one of the seven wonders of the ancient world.

On March 22, 1962, the British anthropologist Louis S. B. Leakey announced his discovery at Fort Ternan, Kenya, of a creature, "neither man nor ape," whose remains have been dated by the potassium-argon process to about 14 million years. Found in the summer of 1961 and named *Kenyapithecus wickeri*, it is a supposed link in human evolution.

Ralph S. Solecki,
Associate Professor of Anthropology, Columbia University.

ARCHERY. See Sports, Games, and Shows.

ARCHITECTURE

A constant theme at architects' conventions and in the architectural press during 1962 was the question: Why are fine buildings more and more numerous, while our cities grow uglier and more inefficient? At the national convention of the American Institute of Architects, controversy centered on approval of "expanded services," in which the architects' talents would be merged with others' to offer a more complete service to the large-scale developer, who is more and more responsible for the shape of our cities. Meanwhile, Jane Jacobs in *The Death and Life of Great American Cities* (1961), surely the year's most talked-about book among architects, denounced large-scale planned and zoned developments as cold and inhuman, and held up as ideal the lively chaos of New York's Greenwich Village or San Francisco's Telegraph Hill.

Interior of TWA terminal at N.Y. International Airport, designed by Eero Saarinen, captures the mood of flight.

TWA BY EZRA STOLLER ASSOCIATES

Perhaps the year's most notably successful attempt to consider at once the important individual building and the fabric of the city was in the redevelopment of historic downtown Boston, attended by a national competition for a new City Hall. The program for the competition was careful to establish the volume of the large building in accordance with a three-dimensional scheme for the entire area. The winning design, by New York architects Gerhardt Kallmann, Noel McKinnell, and Edward F. Knowles, a very much modified stepped pyramid upside down around a court, carries on the robust 19th century Boston tradition of H. H. Richardson, while its strongly sculptural forms bear close affinities to the new buildings of Le Corbusier, the Swiss-French architect whose work is presently the strongest single influence on young architects.

Meanwhile, just across the Charles River in

DANDELET

The Marin County Civic Center in San Rafael, Calif., was completed in 1962. The building was designed by Frank Lloyd Wright.

Cambridge, Mass., was rising Le Corbusier's first building in the United States (if one does not include the UN Secretariat, which he helped design)—a Fine Arts Center for Harvard University. This is an excitingly sculptural form which seems thus far to bear absolutely no relation to anything around it.

By contrast, the completion of Le Corbusier's Assembly Building at Chandigarh, India, served to make much clearer the grand design for that city's government center, in which the architect's Palace of Justice and Secretariat had already been completed. A separation of levels for automobile and pedestrian traffic is being developed, and large artificial hills—echoes of the Himalayan foothills, visible in the distance—are being formed to control the immense spaces between buildings.

The winner of the American Institute of Architects' annual First Honor Award was also a grand design, in which buildings, the spaces between them, the landscaping, furnishings, and equipment had all been considered together. The award went to Ernest J. Kump and Masten & Hurd, architects of a complete new campus for Foothill College, Los Altos, Calif.

The Century 21 Exposition, or Seattle World's Fair, produced a much smaller architectural ripple than its backers had predicted, though its 600-foot Space Needle with a revolving restaurant on top will remain a landmark in Seattle for some time to come, as will the United States Science Pavilion by Minoru Yamasaki. The pavilion is an overtly Gothic fantasy whose concrete skeletal vaults 110 feet high are reflected in a central pool with fountains. If the fantasy seemed less than fantastic, it was undoubtedly because of the almost complete relaxation of any restrictions against flights of imagination in all kinds of permanent buildings, from houses to banks. For instance, Herb Greene's much published house for his own occupancy, on the prairie near Norman, Okla., soars from cavelike spaces to a powerfully upsurging pinnacle; the curved surfaces are heavily textured, sheathed with shingles inside and out, so that the air of fantasy in this already inhabited house far exceeds that of either of the houses of the future shown at the Seattle Fair.

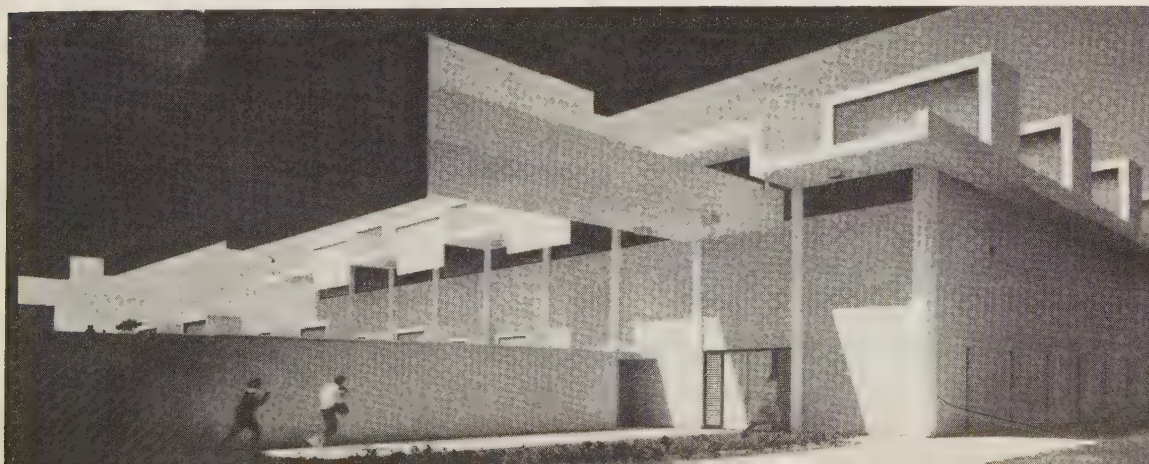
Even banks seemed no longer restricted by a limited vocabulary of forms suggestive of stability or permanence. A new building by Harry Weese for the Irwin Union Bank and Trust in Hope, Ind., acquired a delicate, almost playful character from the 13-foot-square pyramids which roof it, while a thin-shell roof of concrete, swooping down from the center and sweeping up at the corners, almost like a great sail, gave a light and lively silhouette to Meathe, Kessler & Associates' Mt. Clemens (Mich.) Federal Savings and Loan Building.

Eero Saarinen's great curved concrete Trans World Airlines Terminal at New York International Airport, finished in 1962 and meant to look like a bird in flight, brought a similar sense of fantasy to still another building program. Of similar design, Saarinen's terminal building for Dulles International Airport, at Chantilly, Va., went into service on November 19.

The most notable development discernible in the architectural press during the year was a direct result of the increasing number of (by present standards) outstanding buildings now being

This high school in Sarasota, Fla., designed by Paul Rudolph, won an American Institute of Architects merit award in 1962.

EZRA STOLLER



erected. The work produced in several cities became classifiable, and the emergence of a "Philadelphia School" and a "Chicago School" was noted, though the influence of the former, particularly, was seen far beyond the boundaries of Philadelphia itself. The London *Architectural Review* even charged that the important annual Design Awards of *Progressive Architecture* magazine for buildings not yet built had fallen almost entirely into the hands of the "Philadelphia School," though concern did not extend to *Progressive Architecture*'s 1962 First Design Award winner, Vincent Kling, for his Municipal Services Building in Philadelphia.

The late Eero Saarinen's office proceeded with his design for the 38-story CBS Building in New York, which—after Chicago's 60-story Marina City, by Bertrand Goldberg Associates—will be the country's tallest reinforced concrete building. Since the decision to build the CBS tower of concrete came after careful comparison of costs with those of a steel structure, it seemed likely that more and more concrete towers would rise, as new methods of control allow surfaces good enough to be exposed even to severe northern winters.

A number of religious buildings of importance appeared during 1962. Pietro Belluschi and Anderson, Beckwith & Haible's chapel at Portsmouth Priory, Portsmouth, R.I., was a dramatic structure of simple materials and owed a conscious debt to the 6th century Church of San Vitale, in Ravenna. Marcel Breuer's long-awaited church at St. John's Abbey, Collegeville, Minn., similarly achieved high drama with light and shadow on simple materials. But the nonprofessional press was most interested in the completed Coventry Cathedral, in England, the result of a postwar competition won by Sir Basil Spence, and executed with tapestry, mosaics, stained glass, and furnishing by some of England's best-known contemporary artists. Lavish praise was heaped on it, and on Sir Basil's constancy, but many critics failed to find a real purpose to it and doubted whether the singleness of vision that made a medieval cathedral a powerful unified thing was obtainable, or even worth the search, in the mid-20th century.

Acknowledged to be worth the search was a coherent pattern in a whole neighborhood, achieved with increasing frequency. Housing by James Stirling and James Gowan in Preston, England, uses the patterns of the existing city and its inhabitants to achieve this goal. Paul Rudolph, in his Married Students' Housing at Yale University, solves the problem (at least visually) by organizing his complex around a flight of steps; while Toronto's Flemingdon Park, by Irving Grossman, puts parking underground in an integrated complex of high-rise and terrace housing to organize a complete neighborhood.

ARGENTINA

Wedged between the Andes and the Atlantic Ocean to form the southeastern sector of South America, Argentina extends for 2,300 miles from its northwestern highlands to the bleak, windswept plains of Patagonia in the south. It is a big land (1,072,067 square miles), bounded on the west by Chile, on the north by Bolivia and Paraguay, and on the northeast by Brazil and Uruguay. Leading cities include the capital and port of Buenos Aires (1960 census pop., 2,966,816), the river port of Rosario (1954 est., 616,718), the inland manufacturing city of Córdoba (510,739), and La Plata (357,356), capital of Buenos Aires Province. The population of 20,005,691 (1960 census; 21,078,000, mid-1961 est.) is largely of European descent; its language is Spanish.

Government.—The executive branch of this federal republic of 23 provinces and a Federal District is headed by President José María Guido, who was installed by a military coup in March 1962 (see below, *Events, 1962*). He appoints a cabinet, with considerable military advice under prevailing conditions. The national constitution provides for a bicameral National Congress, with a 46-member Senate (2 from the Federal District and from each province except Tierra del Fuego) and a 192-member Chamber of Deputies. Both senators and deputies serve 6-year terms, but one third of the senators retire every 3 years, as compared with half of the deputies. Congress was dissolved in 1962 by the new military-dominated regime. Provincial governors serve 6-year terms, but their posts were occupied in 1962 by military interventors. The federal judiciary is headed by a 5-member Supreme Court.

Education and Religion.—With a literacy rate of 92%, Argentina is one of the best-educated nations in the world. Education is free, secular, and compulsory for all between the ages of 6 and 14. As of 1959, there were 2,800,560 pupils attending 17,081 primary schools served by 115,564 teachers. Enrollment figures on the secondary level included 135,119 students in the general course (with 18,298 teachers in 653 schools), 270,375 students in 1,566 technical schools (34,327 teachers), and 144,749 in 518 normal schools (15,561 teachers). In the 12 institutions of higher education there were 115,005 students served by 4,822 teachers. The overwhelming majority of Argentines is Roman Catholic.

Finance.—Declining exports and rising imports in 1961 had an adverse effect on government fiscal operations. Central Bank holdings of gold and foreign exchange, which reached a peak of $705 million on March 31, 1961, were reduced by the end of the year to $461 million under the impact of the trade deficit, foreign debt obligations, and business dubiety concerning government policies. In December, Congress approved a budget (government departments and decentralized agencies) for the fiscal year 1962 (ending Oct. 31, 1962) amounting to 180 billion pesos (171 billion in fiscal 1961). About 13.2 billion pesos of the 1962 budget was to be covered by long-term borrowing. At the end of 1961 the public external debt totaled $1.7 billion, and servicing requirements for several years would amount to about $300 million annually, a sum nearly equivalent to 30% of recent annual export earnings. The cost-of-living index (1958 = 100) rose from 272 in 1960 to 309 in 1961.

Many of the conditions of concern evident in 1961 were aggravated by the political upheavals of 1962. The dollar exchange rate of the peso rose from 83.02 on Dec. 31, 1961, to 135 on June 30, 1962, increasing the cost of materials imported to sustain the industrialization program. Meanwhile, the Central Bank's gold and foreign exchange holdings declined to $239 million. Government revenues became so depleted that public payrolls could not be met properly. By June 30, the cost-of-living index had risen to 393. Public and private credit dried up, contributing to a large increase in bankruptcies. Strict import controls were decreed, and many government development programs were cut back. In August, the Central Bank reported that, as of April 30, the foreign debt of the Argentine government and state-owned enterprises totaled $2,620 million, of which $487 million represented interest. The treasury's statement for the first 8 months of the fiscal year showed new obligations of more than 101 billion pesos and cash receipts of less than 65 billion. Part of the deficit was covered by loans from Central Bank and social security funds. The peso continued to decline in value, and on December 5 was quoted at 154 to the dollar.

Transportation and Communications.—The 27,873-mile state railway system is run down and the source of large deficits. According to the International Bank for Reconstruction and Development (IBRD), it would cost $1.4 billion to put the system on a paying basis by 1971. Efforts at rehabilitation were impeded by the 42-day railway strike of 1961 and by the fiscal crisis of 1962.

Argentina has approximately 91,200 miles of federal and provincial roads (12,200 miles paved or improved). The major highway building program that was begun in 1960 made good progress in 1961, but had to be cut back in 1962. Two of Argentina's three private international air carriers went into receivership in 1961, and in November the government decreed that Aerolíneas Argentinas was to be the sole national flag carrier in international service. In May, the two government-owned overseas shipping companies were merged. At the end of the year the merchant marine consisted of 229 vessels aggregating 1,230,713 gross tons.

In 1961 there were 1,295,856 telephones and 6 television stations; in 1960, 63 radio stations.

Economic Conditions.—After four years of effort, in 1961 the policies of the administration of Presi-

Forced from office by the military on March 29, Argentina's President Arturo Frondizi (*l.*) was replaced by José María Guido (*r.*) After dispute between military factions, Gen. Juan Ongania (*center*) emerged on September 23 as army commander in chief, and promised an early election.

WIDE WORLD; UPI; WIDE WORLD

dent Arturo Frondizi seemed to promise correction of some of the economic abuses inherited from the Peronist era of 1943–55. Some progress had been made in ridding the government of deficit-plagued economic enterprises and in cutting down the bureaucracy. Although there was a large trade deficit, imports consisted mostly of capital goods that would contribute to industrial production. Private foreign investment was large and growing. In January 1962, the government claimed an increase in the gross national product for 1961 of 5.7% over 1960, measured in constant 1950 values —which would give Argentina one of the higher rates of growth in the world. To be sure, the gains were registered mainly in petroleum production and in manufacturing, and the great agricultural industry remained in the doldrums into which the dictator Juan Domingo Perón had driven it.

Agriculture.—Production of the principal export grains, which had generally declined in the crop year 1960–61, rose in 1961–62. Output of these and other major crops was as follows, in thousands of metric tons: barley, 827; corn, 5,220; cotton (clean fibers), 120; cottonseed, 227; linseed, 770; oats, 710; peanuts, 300; rye, 530; sorghum, 1,838; sugar, 694; sunflower seed, 820; and wheat, 5,100.

The cattle industry was damaged by drought in 1961. Because of this and other conditions, the slaughter of cattle was 6% higher than in 1960, and by 1962 there was concern that heavy slaughter was cutting into breeding stock. Sheep and hog slaughter declined by 4% and 17%, respectively, in 1961. The output of meat totaled 2,233,000 metric tons in 1960–61, as compared with 2,301,000 in 1959–60. Wool production (greasy basis) declined from 487.4 million pounds in 1960–61 to 460 million in 1961–62.

Industry.—In 1961 the government continued a wide variety of aids to manufacturing enterprises. The general industrial production index (1953 = 100) averaged 128, as compared with 116 in 1960. All groups in the durable goods field registered increases, the greatest gains being made by the vehicle, machinery, and metals industries. A general advance among nondurable manufactures was led by petroleum derivatives, chemicals, rubber, and paper; textiles also improved. The fastest growing industry was the automotive, which produced 136,190 vehicles in 1961, as compared with 89,280 in 1960 and less than 33,000 in 1959. Expansion continued in the steel industry, production of crude ingots rising from 277,200 metric tons in 1960 to 441,600 tons in 1961.

Construction activity improved somewhat in 1961. In July, the government established a Federal Housing Administration to stimulate private housing construction. Meanwhile, shortages of electric power continued to impede industrial operations and expansion. Some foreign credits were obtained to expand power production, including an IBRD loan of $95 million in January 1962.

Mineral Products.—In 1961, Argentina produced small quantities of several minerals, including 344,400 metric tons of coal, and explored the possibility of extending operations. But the major development continued to be in petroleum, with an output of 12,084,000 metric tons, as compared with 9,132,000 tons in 1960. With production in the first 5 months of 1962 about 9% higher than in the same period of 1961, Argentina was nearing self-sufficiency. Yacimientos Petrolíferos Fiscales (YPF), the national petroleum agency, was active in signing new exploration and exploitation contracts, including one in December 1961 whereby Ente Nazionale Idrocarburi (ENI), the Italian state petroleum agency, would invest $100 million. The use of natural gas continued to rise in Argentina, from 134 million cubic feet a day in 1960 to 219 million in 1961.

Foreign Trade.—Argentina had a trade deficit of $496.3 million in 1961, the largest in its history. Imports totaled $1,460.4 million, as compared with $1,249.2 million in 1960. Machinery and vehicles together accounted for 45.4% of the value. The United States was Argentina's principal supplier in the period January–November 1961, furnishing 26.1% of total imports; other leading suppliers were West Germany, 14.5%; the United Kingdom, 9.6%; Italy, 7.1%; France, 5.4%; and Brazil, 5.2%.

The chief factor in the decline of exports from $1,079.2 million in 1960 to $964.1 million in 1961 was the smaller grain harvest of 1960–61. Meat was the leading export in 1961, accounting for 22.6% of total value. Among other exports were wool, hides, and miscellaneous farm products. The United Kingdom was Argentina's principal customer, taking 17.8% of exports by value in January–November 1961; others were the Netherlands, 14.8%; Italy, 11.2%; the United States, 8.6%; and West Germany, 7.9%.

The depressed condition of foreign trade in the major crops led to tax concessions late in 1961 and early in 1962. As a result of these concessions, improved weather, and devaluation of the peso, exports of most grains during the first half of 1962 exceeded those for all of 1961. Total exports for the 6 months rose to $615.1 million, while imports were held to $678.6 million, reducing the unfavorable trade balance.

Events, 1962.—After surviving many crises since 1958, President Frondizi was finally driven from office by his military critics in 1962. The immediate occasion was the election of March 18. The president suddenly allowed the Peronists (largely

labor union members) to offer their own candidates for the first time since the fall of the former dictator in 1955, expecting that this step would prove advantageous to his own Radical Intransigent Party (UCRI). Instead, the Peronists polled 35% of the popular vote, as compared with 28% for the UCRI, 22% for the People's Radical Party (UCRP), and 15% for smaller groups; and captured a number of governorships and provincial offices, and a large minority of the national Chamber of Deputies.

The military, which was strongly anti-Peronist, reacted violently. The election results, coming soon after Frondizi's soft policy on Fidel Castro's Cuba had been exhibited at the Punta del Este Conference of January (see INTER-AMERICAN AFFAIRS), and on top of dissatisfaction with his economic policies, led the military to compel the president to annul the elections won by Peronists in six provinces. The military held many meetings in which, as everyone was aware, they were deciding whether or under what conditions they would permit Frondizi to remain as president. The Peronists called a general strike for March 23. The UCRI tried to effect a union with the UCRP and failed. The military attempted to force Frondizi to resign; this failing, on March 29 they occupied key points in Buenos Aires and imprisoned him (he remained a prisoner at the end of the year). On March 30, they installed the official next in line for the presidency according to the constitution, Senate President Guido.

The new regime was dominated by the armed forces. On April 24–25, the results of both provincial and congressional elections were annulled, and military interventors were put in charge of the provinces. Congress was forced into recess in May (it was dissolved on September 6). The military—especially the army—soon showed itself deeply divided over when and how to return to constitutional government, and especially over the matter of future elections; and over the problem of Peronism. Eventually, two major army groups (each with many subgroups) appeared: the "democrats," who opposed concessions to the Peronists, wanted elections held no earlier than October 1963, and included a large element favoring the erection of a military government; and the "nationalists," who favored earlier elections and civilian constitutional government, and were somewhat less intransigent on the Peronist question. Both groups clearly were essentially anti-Peronist, anti-Communist, strongly nationalist, and determined to exercise some control over civil government. As the debate between military factions went on, it was complicated by a developing economic crisis. By July, unemployment led to violence and to strikes by Peronist-led unions.

The divisions in the army reached a crisis on August 8, when a rebellion was started by "democrat" Maj. Gen. Federico Toranzo Montero to increase his faction's already considerable hold on the administration. Military commanders arrested army officers of opposing factions, and it appeared that civil war might result. Fevered consultations led to the rapid replacement of two ministers of War and to the seating of "democrat" Gen. José Octavio Cornejo Saravia. Ostensibly, these actions were directed toward ensuring sufficiently strong control of Peronists and Communists. Actually, most military disputes were by this time affected by considerations relating to the professional careers of the senior members of the officer corps.

In succeeding weeks serious friction continued between military "democrats" and "nationalists," especially as the former apparently intended to eliminate the latter from important command positions. As a result, the "nationalists," led by Lt. Gen. Juan Carlos Ongania, began a revolt on September 18, assertedly on the ground that it was necessary to prevent the erection of a military dictatorship. During the fighting for the next several days, the tanks of the "nationalist" forces, aided by some air force planes, were victorious. Casualties apparently were not heavy. On September 23, Guido named Ongania commander in chief of the army. "Nationalist" officers were installed in the War Ministry and other top posts.

General Ongania announced that Guido would be allowed more freedom of action; how much remained to be seen. He also promised an early election that would permit participation by all sections of the population. Although Guido immediately began remaking his cabinet, it seemed significant that he retained as minister of the economy Alvaro C. Alsogaray, whose policies of austerity had dissatisfied some military officials as well as most Peronists. On December 4, however, military opposition forced Alsogaray's resignation. Other officials also resigned, amid signs that Guido's position was weakening. An air force revolt was crushed on December 12. Meanwhile, on November 19, it was announced that presidential and congressional elections would be held on June 16, 1963.

ROBERT JONES SHAFER,
Professor of History, Syracuse University.

ARIZONA

A Southwestern state of the United States, Arizona ranks 6th among the states in area (land, 113,575 sq. mi.; inland water, 334) and 34th in population (1,509,000 on July 1, 1962, a 15.9% increase from the 1960 census figure of 1,302,161). Urban places with populations above 7,500 in 1960:

Bisbee	9,914	Phoenix (*capital*)	439,170
Casa Grande	8,311	Prescott	12,861
Chandler	9,531	Scottsdale	10,026
Douglas	11,925	Tempe	24,897
Flagstaff	18,214	Tucson	212,892
Glendale	15,696	Winslow	8,862
Mesa	33,772	Yuma	23,974

Government.—Chief executive and judicial officers in 1962 included Paul J. Fannin (Republican), governor, serving a two-year term; Wesley Bolin, secretary of state; J. W. Kelly, treasurer; Mrs. Jewel W. Jordan, auditor; Robert Pickrell, attorney general; W. W. Dick, superintendent of public instruction; and Charles C. Bernstein, chief justice of the 5-member Supreme Court.

The Arizona Legislature, which convenes annually, comprised 24 Democrats and 4 Republicans in the Senate in 1962 and 52 Democrats and 28 Republicans in the House of Representatives.

Legislation, 1962.—Arizona's regular legislative session (January 8–March 22) passed 150 bills, one of which was vetoed by Republican Gov. Paul Fannin. Legislation of special significance concerned mandatory open public meetings (except executive sessions) in all state and local government units and agencies; authorization for county air pollution control districts; creation of Courts of Conciliation for divorce cases at the Superior Court level; salary raises for major state and county officials; repeal of the state antimiscegenation law; mandatory annual inspection of motor vehicles; and a law requiring equal pay to women doing similar work as men in private employment.

In the November general election, five of six issues on the ballot received voter approval. The successful proposals were constitutional amendments providing for the continuity of state and local government operations in periods of emergency; authorizing mandatory primary and general elections to fill vacancies occurring in the state's United States senatorial and congressional seats; delegating to the Legislature authority to determine qualifications for voters in presidential elections; and authorizing licensed real estate brokers and salesmen to prepare legal instruments incident to property transactions. Failing of passage was an initiative proposal to create a State Board of Appraisal for the purpose of directing a survey and reappraisal of property for taxation purposes.

Finance.—In the 1962 fiscal year, revenue of $227,336,324 included $133,911,119 from state taxes and $57,-

287,392 in federal funds. Chief tax yields were the 2% general sales tax ($20,576,063), an educational-excise tax ($25,308,906), and individual and corporate income taxes ($20,074,209). Spending of $235,590,456 included $88,372,684 for education, $47,408,395 for health, welfare, and safety, and $87,149,377 for highways.

Education.—In the 1961–62 school year public elementary schools staffed by 9,684 teachers enrolled 225,462 pupils; secondary schools with 3,279 teachers enrolled 68,574; and parochial schools with 666 teachers enrolled 24,292. College enrollment totaled 38,239 in 7 institutions including 2 public junior colleges and 3 public senior colleges and universities.

Public school spending in the 1961–62 school year totaled $125,778,978 ($427.77 per pupil), from revenues comprising 47% from local districts, 43% from the state, and 10% from federal funds. Teachers' salaries (1962–63) averaged $4,900 (high school, $5,200; elementary, $4,700). Actual spending for higher education (1961 fiscal year) totaled $37,314,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 58,928 persons totaled $26,135,842. This amount included $13,019,457 for dependent children and $10,004,560 for the aged.

Transportation and Communications.—With 277 miles of highway construction and reconstruction completed in the 1961–62 fiscal year, *roads and highways* in January 1962 totaled 39,136 miles (16,960 hard-surfaced). These served 751,517 *motor vehicles* (as registered in December 1961), including 518,795 automobiles. Operating in the state in 1962 were 6 *railroads* (using 2,296 line miles of track) and 7 regularly scheduled *airlines*. There were (1961) 51 general and 82 limited service *airports*.

Communications media included (1961) 52 AM and 10 FM *radio stations;* 9 *television stations;* 14 daily *newspapers* (circulation, 389,112) and 90 other newspapers; and (Jan. 1, 1962) 169,000 business and 321,500 residential *telephones*.

Labor Force.—The state's labor force on July 15, 1962, included 36,700 agricultural workers. Nonagricultural employment totaled 421,700, compared with 401,500 a year earlier and an average of 416,100 for the 12 intervening months. Of nonfarm employees, 24% were in trade, 21% in government services, and 15% in manufacturing. Unemployment on July 15, 1962, stood at 24,700, compared with 28,000 a year earlier.

Manufacturing.—Manufacturing engaged 48,020 in 1960, including 34,259 in production, and provided a payroll of $274,376,000. Adjusted value added by manufacture totaled $459,137,000.

Principal industry groups in 1960 were: food and kindred products, with 6,032 employees, a payroll of $30,848,000, and an adjusted value added by manufacture of $70,915,000; primary metals (5,175; $32,151,000; $48,988,000); electrical machinery (4,496; $27,293,000; $46,289,000); and stone, clay, and glass products (2,672; $14,225,000; $31,967,000).

Mining.—Arizona ranked 13th among the states in the value of its mineral production in 1961, with 2.39% of the national total. It was the highest value on record since 1956. The state was first by far in output of copper, with 50% of the national total. It was first in pumice; second in silver; third in asbestos, gold, molybdenum, perlite, and vanadium; and fifth in mercury and uranium.

ARIZONA MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Clays[1]	[2]	$ 240,000
Copper (recoverable content of ore)	587,053	352,232,000
Gold (troy ounces)	145,959	5,109,000
Lead (recoverable content of ore)	5,937	1,223,000
Lime	167,000	2,686,000
Molybdenum (molyb. content in pounds)	4,878,000	6,232,000
Pumice	745,000	1,893,000
Sand and gravel	21,953,000	24,706,000
Silver (troy ounces)	5,120,000	4,733,000
Stone	3,582,000	4,626,000
Uranium ore	228,225	4,965,000
Zinc (recoverable content of ore)	29,585	6,804,000
Other minerals	...	19,062,000
Total	...	$432,614,000[2]

[1] Excludes certain clays, value of which is included in "Other minerals." [2] Total has been adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $276,586,000, compared with $267,480,000 for the corresponding period of 1961. For the full year 1961, income comprised $177,038,000 from livestock, $289,533,000 from crops, and $5,285,000 in government payments. Principal income sources in 1961 were cotton lint, $142,809,000; cattle, $140,726,000; lettuce, $36,038,000; and milk, $22,809,000.

The state's 7,233 farms in 1959 had an acreage of $40,203,000 (1,019,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,041,000 cattle and 1,031,000 chickens.

ARIZONA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Barley (1,000 bu.)	9,023	11,220	7,800
Cantaloups (1,000 cwt.)	2,379	1,920	2,206
Cotton lint (1,000 bales)	835	828	885
Cottonseed (1,000 tons)	347	342	372
Grapes (tons)	5,447	9,230	12,100
Hay (1,000 tons)	844	1,209	1,150
Lemons (1,000 boxes)	670[1]	1,540	500
Lettuce (1,000 cwt.)	6,971	10,143	9,429
Oranges (1,000 boxes)	1,089	1,440	1,000
Potatoes (1,000 cwt.)	1,442	2,472	1,955
Sorghum grain (1,000 bu.)	4,453	7,475	6,076

Events, 1962.—In the November general election, Republican Gov. Paul Fannin won over Democrat Sam Goddard, marking the first time that a Republican has won a third gubernatorial term in Arizona. Elected to the U.S. Congress were incumbent Democrat Sen. Carl Hayden, incumbent Republican John J. Rhodes from the 1st Congressional District, incumbent Democrat Morris K. Udall from the 2d District, and Democrat George F. Senner from the state's new 3d District. The 85-year-old Senator Hayden, who on February 19 marked his 50th year in Congress (a record for longevity), defeated State Sen. Evan Mecham, 38, a conservative Republican.

The year marked the semicentennial celebration of Arizona statehood, and also the participation by the University of Arizona in the centennial observance of the nation's land grant university and college system.

Lack of rainfall in several livestock counties resulted in their classification as drought areas by the federal government. Later in the year storm conditions in southern Arizona flooded agricultural and Indian reservation areas in Pima and Pinal counties, causing property and crop damages estimated in excess of $21 million. Federal emergency assistance was provided in both drought and flood areas.

In Phoenix, the city's new air terminal facilities were opened to the public, and a controversial 2-cent city gasoline tax was levied but was voided by the Superior Court. Several convictions were handed down in the three-year-old case involving mismanagement of Arizona Savings and Loan Association depositors' funds.

In the Tucson area, the world's largest solar telescope was completed and installed at the Kitt Peak National Observatory (see ASTRONOMY). Investigations were initiated and concluded into alleged waste in the Titan missile complex. Controversy continued in city hall politics, resulting in divisions in the Republican-controlled City Council, the hiring of a new city manager, and the death of Tucson's proposed urban renewal program.

The U.S. Supreme Court held reargument on the 10-year-old dispute between Arizona and California over division of the Colorado River's

water. Arizonans anticipated a favorable decision during the 1962–63 court session.

In education, Maricopa County voters approved a proposal to establish a junior college district in the county (involving the transfer of Phoenix Junior College into the state system). Voters in Cochise County approved a capital bond issue and decided a controversy over the location of their junior college by voting to place it at Paul Spur, near Douglas.

In other events of significance, the controversy over revaluation of taxable property held the public's attention, despite the defeat of a proposal at the polls (see above *Legislation, 1962*); the Board of Regents authorized an appropriation request of $160,000 to the Legislature for planning a medical school at the University of Arizona; and construction progressed on the memorial auditorium, designed by Frank Lloyd Wright, on the Arizona State University campus.

ARKANSAS

A South Central state of the United States, Arkansas ranks 27th among the states in area (land, 52,499 sq. mi.; inland water, 605) and 32d in population (1,823,000 on July 1, 1962, a 2.1% increase from the 1960 census figure of 1,786,272). Urban places with populations above 15,000 in 1960:

Blytheville	20,797	Jonesboro	21,418
Camden	15,823	Little Rock (*capital*)	107,813
El Dorado	25,292	North Little Rock	58,032
Fayetteville	20,274	Pine Bluff	44,037
Fort Smith	56,524[1]	Texarkana	19,788
Hot Springs	28,337	West Memphis	19,374

[1] Special census, Aug. 3, 1961.

Government.—Chief executive and judicial officers in 1962 included Orval E. Faubus (Democrat), governor, serving a two-year term; Nathan Gordon, lieutenant governor; Mrs. Nancy J. Hall, secretary of state, Lee Arthur Clayton, treasurer; Jimmie Jones, auditor; Frank Holt, attorney general; A. W. Ford, commissioner of education; and Carleton Harris, chief justice of the 7-member Supreme Court.

The Arkansas General Assembly, which convenes in odd-numbered years, comprised 35 Democrats in the Senate in 1962 and 100 Democrats in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $297,341,316 included $181,360,714 from state taxes and $84,291,205 in federal funds. Chief tax yields were the 3% general sales tax ($56,586,643), taxes on motor fuels ($42,991,996), and licensing ($21,985,453). Spending of $291,676,916 included $70,436,551 for education, $69,248,367 for health, welfare, and safety, and $79,432,208 for roads and highways.

Education.—In the 1961–62 school year (according to estimates), public elementary schools staffed by 8,557 teachers enrolled 252,363 pupils; secondary schools with 6,896 teachers enrolled 177,777; and parochial schools with 393 teachers enrolled 10,776. College enrollment totaled 27,719 in 19 institutions, including 2 junior colleges and 17 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $120,693,000, including current expenditures of $99,457,000 ($261.02 per pupil) and capital outlays of $18,189,000. Revenue of $127,555,000 was drawn chiefly from state funds ($50,136,000) and local districts ($50,053,000). Teachers' salaries averaged $3,614 (high school, $3,820; elementary, $3,441). Actual spending for higher education (1961 fiscal year) totaled $28,090,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 73,223 persons totaled $46,044,319. This amount included $35,751,998 for the aged and $4,939,963 for dependent children.

Transportation and Communications.—With 480 miles of highway construction and reconstruction completed in 1961, *highways and roads* as of Jan. 1, 1962, totaled 79,176 miles (13,689 hard-surfaced). These served 777,523 *motor vehicles* (as registered Dec. 31, 1961), including 507,612 automobiles. Operating in the state in 1962 were 28 *railroads* (using 3,717 line miles of track) and 6 regularly scheduled *airlines*. There were 13 commercial and municipal *airports*.

Communications media included (1962) 71 AM and 8 FM *radio stations;* 6 VHF *television stations;* 30 daily *newspapers* (circulation, 383,844) and 133 other newspapers (663,444); and (January 1) 135,500 business and 335,500 residential *telephones*.

Labor Force.—The state's labor force in September 1962 included 186,900 agricultural workers. Nonagricultural employment totaled 506,900, compared with 508,200 a year earlier and an average of 500,000 for the fiscal year 1962. Of nonfarm employees, 21.8% were in manufacturing, 16.7% in trade, and 15.3% in government services. Unemployment in September 1962 had dropped to 30,400 from the 37,800 reported in the previous September.

Manufacturing.—Manufacturing engaged 102,657 workers in 1960, including 86,661 in production, and provided a payroll of $362,834,000. Adjusted value added by manufacture totaled $752,096,000.

LEADING ARKANSAS MANUFACTURES, 1960[1]

Industry group	Total employees	Total payroll (in thousands)	Adjusted value added by mfr.[2] (in thousands)
Lumber and wood products	23,031	$69,375	$104,972
Paper and allied products	6,397	34,793	95,519
Food and kindred products	14,290	43,091	93,202[3]
Chemicals and products	3,199	19,476	56,949
Stone, clay, glass products	3,699	16,395	41,324
Electrical machinery	3,765	14,548	41,094
Furniture and fixtures	7,565	24,148	39,329
Leather and products	5,210	13,864	26,719
Printing and publishing	3,005	12,629	25,415

[1] Unless otherwise noted. [2] For definition, see footnote 1 in the article *Industrial Production.* [3] Source: *U.S. Census of Manufactures: 1958.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—Among the states, Arkansas ranked 25th in the value of its mineral output, with 0.82% of the national total in 1961. It was first in barite and bauxite; and third in bromine. Total mineral value declined 6% from 1960, due mainly to the reduction in output of bauxite. Mineral fuels, providing the largest part of the state's mineral value, declined 3% of the total value.

ARKANSAS MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Barite	277,855	$ 2,630,000
Bauxite (long tons)	1,178,898	13,462,000
Clays	773,000	1,758,000
Coal	395,000	2,888,000
Lime	192,000	3,168,000
Natural gas (1,000 cu. ft.)	59,547,000	8,039,000
Natural gasoline (1,000 gal.)	27,889	1,640,000
Petroleum (1,000 gal.)	29,249[1]	80,435,000[1]
Petroleum gases (1,000 gal.)	75,157	3,286,000
Sand and gravel	9,389,000	9,074,000
Stone	12,029,000	12,402,000
Other minerals	...	11,465,000
Total	...	$149,138,000[2]

[1] Preliminary. [2] Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $363,298,000, compared with $329,692,000 for the corresponding period of 1961. For the full year 1961, income comprised $270,660,000 from livestock, $499,299,000 from crops, and $15,644,000 in government payments. Principal income sources in 1961 were cotton lint, $243,325,000; soybeans, $121,444,000; and broilers, $94,574,000.

The state's 95,000 farms in 1959 had an acreage of 16,459,000 (5,325,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,374,000 cattle, 8,046,000 chickens, and (1961) 229,104,000 commercial broilers. An average of

ARKANSAS CROP STATISTICS

(Source: U.S. Department of Agriculture.)

118,000 family and 85,000 hired workers were engaged in farming during 1961.

Events, 1962.—Retracting a March 31 announcement of intent to retire, Gov. Orval E. Faubus filed on May 2 for the Democratic nomination to a fifth term. Chief among his five opponents in the primary race were ex-Gov. Sidney S. McMath, who made Faubus a personal aide and then state highway director in the early 1950's, and U.S. Representative Dale Alford, who won office with Faubus' blessing in the wake of the 1957–58 Little Rock school integration crisis but lost his district in the 1961 reapportionment.

During the campaign, Faubus said so little against integration that archsegregationist former supporters openly denounced him. The governor countered his five opponents' main issue—that a fifth term would endanger the state's future—by pointing to recent industrial growth and increased state services. Faubus won in the first primary, July 31, with 51.6% of the vote (as contrasted to 68.9% in 1958 and 58.8% in 1960). In the same primary, U.S. Sen. J. William Fulbright was nominated for a fourth term over Winston Chandler, who attacked Fulbright as a liberal.

By August, the Republicans had launched possibly their biggest attempt of the century to make Arkansas into a two-party state. Although they entered some 150 candidates in the general election for city, county, and district offices, and provided opposition to both Governor Faubus and Senator Fulbright, the Republicans did not come close to winning any but a few city and county positions, and even lost the one seat which they had held in the 1961 General Assembly.

Also on November 6, voters adopted a constitutional amendment to permit the use of voting machines in Arkansas, but rejected all other proposals. These included amendments to increase the taxing power of cities, to permit salary increases for state and county officials, and to assure that no child who objects to attending integrated schools would be denied public education. Two initiated proposals backed by the Arkansas Education Association also met defeat—one to earmark at least half of the state's general revenues for public school use, and the other to assure the actuarial soundness of the Teacher Retirement System.

Despite chronic unemployment in many areas, nonfarm jobs in Arkansas hit a new high late in 1962. Eighty-one new plants and 102 plant expansions were announced in the year ended June 30. At Fort Smith, officially declared Arkansas' second largest city in August 1962, work began on a new Gerber baby foods processing plant, the third major industry to locate there in as many years. Near Ashdown, construction began on the $55 million Millwood Dam on the Little River, the newest of several major federal water projects now in progress in Arkansas. Overall 1962 farm production, still the state's main source of income, was good despite the driest May since 1918.

The public schools opened peacefully in September, with nearly 250 Negro children attending classes with white students in 12 school districts.

The Schola Cantorum of the University of Arkansas was awarded first prize in the Guido d'Arezzo international polyphonic competition held at Arezzo, Italy, in August. On its return from abroad, the chorus was invited by President Kennedy to sing at the White House.

ARMY OF THE UNITED STATES

Large as were the increases in all United States armed services in 1962, following the impulse provided by the Berlin crisis of 1961, the changes within the Army were proportionately greatest. This was due in part to the considerable lag in modernization which had afflicted that service once the Korean truce lessened the national feeling of urgency. But the regeneration was due even more to the Kennedy administration's agreement with the Army chiefs that, quite beyond the unquestioned need for nuclear weapons, the nation required far more resources within the Army itself for coping with the many conceivable forms of limited warfare.

In mid-1961 the Regular Army had, nominally, 14 divisions (infantry, airborne, and armored), but of these only the 5 in Europe and 2 of the 6 in the United States could be regarded as truly combat-ready. The 2 on station in Korea, the 1 in Hawaii, and 4 of those in the United States were below strength. Worse yet, 3 of those in the

(*Left*) The surface-to-surface tactical missile Sergeant was test-fired in 1962. (*Center*) Meeting with President Kennedy, October 31, are (from left) Lt. Gens. Theodore W. Parker and Hamilton W. Howze and Gen. Earle Wheeler, Army chief of staff. (*Right*) A National Guard unit activated in 1961 during Berlin crisis is mustered out in Platteville, Wis., August 6.

U.S. ARMY, UPI, WIDE WORLD

United States were in reality wholly occupied with the training of recruits for transfer to the other divisions.

The Berlin crisis, plus a more acute concern with Communist-led insurgency against the government of South Vietnam, led to action in several fields. The three training divisions referred to were relieved of their training duties and rapidly transformed into combat status, and two additional divisions (the 1st Armored and the 5th Infantry) were recreated. To each of the below-strength divisions "filler" personnel was added, and the corps and field army establishments were built up by the usual addition of support units. This was achieved by increasing the draft, extending the terms of duty of volunteers, and bringing in divisions and lesser units from the National Guard and Army Reserve, as well as individual reservists, for periods averaging 10 months—long enough to permit the Regular Army to attain its newly scheduled strength in units composed of trained men.

The year 1962 also witnessed a steady increase in the number of Army Special Forces, an elite group of volunteers specially chosen for strength, courage, fortitude, resourcefulness, and the skills needed in counterguerrilla warfare such as unconventional fighting, radio, field medicine, local language and dialects, and leadership. A prime employment of such troops is that under way in South Vietnam, where Special Forces units are engaged in the training of indigenous forces in the highly specialized arts just mentioned. (See also VIETNAM.)

Accompanying the numerical enlargement of the Army and the new emphasis on unconventional warfare tactics has been a marked addition of modern weapons and equipment. This has long been urged by Army chiefs of staff as a requirement in modernization, most emphatically by Gen. Maxwell D. Taylor in 1960, with his contention that roughly $1.5 billion a year was needed for mere replacement due to depreciation, and a like amount annually for five years to replace obsolescent equipment. In each of the fiscal years 1962 and 1963, $2.6 billion was allotted for new weapons and equipment. The entire Army budget for the fiscal year 1963 is $11,574,067,000, against $11,996,496,000 in fiscal 1962.

Increasing emphasis was laid in 1962 also upon the Army's aviation arm (wholly distinct from the U.S. Air Force), which is more and more necessary to permit the aerial reconnaissance and battlefield mobility essential in modern land warfare. A measure of Army Aviation's growth is provided by the current total of 5,650 Army planes and helicopters (compared with the Air Force's total aircraft inventory of about 16,200). Projected for mid-1963 in Army Aviation are 3,078 helicopters and 2,883 light planes. (See also AERONAUTICS; MISSILES.)

Administration.—Cyrus R. Vance, former general counsel of the Defense Department, became secretary of the Army on July 5, 1962, following the resignation of Elvis J. Stahr, Jr. Gen. Earle G. Wheeler, former deputy commander in chief of the U.S. European Command, was advanced to chief of staff, U.S. Army, replacing Gen. George H. Decker, who retired. Gen. Paul L. Freeman, Jr., became commanding general, U.S. Army Forces, Europe, and Lt. Gen. Hugh P. Harris was named commanding general of the principal field force, the U.S. Seventh Army stationed in Germany. Gen. James F. Collins continued to head U.S. Army Forces, Pacific, and Gen. Guy S. Meloy, Jr., the Eighth Army in Korea.

Gen. Paul D. Harkins, Jr., heading the U.S. Military Advisory Groups to both South Vietnam and Thailand, became largely responsible for aid and advice in the counter-insurgency program for southeast Asia. In the United States, Gen. Paul D. Adams became head of the newly created U.S. Strike Command, composed of the Army's highly mobile Strategic Army Corps and the Tactical Air Command elements required for its movement and support.

The year witnessed a major administrative change within the Army organization, initiated by Defense Secretary Robert S. McNamara but designed by the Army itself. This constituted a complete reshuffling of traditional functions and services in pursuit of clearer fixing of responsibilities. The ancient Ordnance and Quartermaster establishments were completely fragmented, their functions being redistributed among several new commands. Four basic Army missions were recognized and allotted to strongly centralized commands, most easily summarized as follows: (1) determining how to fight and with what (to the Combat Development Command); (2) acquiring the wherewithal to fight (to the Army Matériel Command); (3) providing the men to fight (to the Office of Personnel Operations); and (4) training the men to readiness (to the Continental Army Command).

Strength.—The Army's total personnel at mid-1962 stood at the high temporary figure of 1,066,404, much of this due to the presence of reservists still on active duty and Regular Army personnel who, due for retirement some months earlier, had been kept on extended duty by reason of the Berlin crisis. With the return of these troops to civilian life in the late summer of 1962, the Army roster dropped sharply. Its targeted size for mid-1963 is 980,000, compared with the actual 858,622 of pre-crisis 1961. Of the 980,000, about 20,000 will be temporary, permitting advance training of recruits in order to let them replace, without loss of efficiency, the two-year men who enlisted in late 1961 in large numbers to cope with the Berlin crisis.

By late 1962 the Army's main combat elements comprised 16 divisions, 5 armored cavalry regiments, 3 separate brigades, 10 separate battle groups, 3 missile commands, 63 air defense (guided missile) battalions, and 33 surface-to-surface missile battalions. Additional support elements are purposely kept to the number regarded as essential for peacetime operation, plus a margin for emergency. Much larger support forces, not so near readiness, are set up both in the National Guard and Army Reserve. The Cuban crisis in late 1961 called for no notable changes in the existing structure of the Army.

Reserve Forces.—After a study of the virtues and defects visible in the 1961–62 experience, the Army, by direction of the Defense Department, undertook a grand-scale reorganization of its reserve components. It established the principle that the Regular Army should be relied on to maintain the overseas establishments, mobile forces at home for quick reinforcement or for sudden requirements in new areas, and defense against attack on the homeland, and to set up a mobilization base and direct troop training. Accordingly, the prime (but not the sole) national purpose of the reserve components would be to supplement the Regular Army establishment. The proposal to Congress by Defense Secretary McNamara inevitably called for radical changes, some of which were so hotly opposed by reservist leaders that Congress warned the Pentagon against moving too rapidly.

A measured review of what has been determined already and what is still required was scheduled for presentation to the House Armed Services Committee in February 1963. Anticipated were: (1) realignment of four National Guard and four Reserve divisions into brigades; (2) transformation of about 1,000 smaller units from their previous purposes to more urgently needed functions; and (3) elimination of several hundred other units as being no longer necessary. The planning of all these measures is complete. The expectation is that most of these radical changes will be accepted by Congress for gradual implementation.

Research and Development.—In the Army's budget for 1963, $1,319,000,000 was allotted to what is officially labeled "research-development-test-evaluation" activities. This record sum is indicative of the rapidly increasing attention given by all the military services to ascertaining new needs and meeting them with celerity. The year 1962 brought numerous items of equipment out of the laboratory into factory lines and thence to troops. The new matériel was marked variously by reduced weight and size (for field mobility and air transportability), and by increased range, firepower, reliability, or ruggedness. The new centralization of authority in the Army Matériel Command seeks to shorten the period of transition from weapons design to field use.

ASTRONAUTICS. See SPACE FLIGHT.

ASTRONOMY

Steady progress was made in 1962, particularly in the relatively new applications of radio and electronics in astronomy. In America, general interest in astronomy is proved by the building of many new planetariums for popular instruction and the greater number of amateur scientific societies doing good work, while observatories are adding staff and equipment. The first Orbiting Solar Observatory (OSO) was launched into earth orbit on March 7, 1962 from Cape Canaveral, Fla. It telemetered data which filled 200 miles of magnetic tape on the sun's ultraviolet, X-ray, and gamma-ray radiation and on more than 75 solar flares before it ceased operating on May 22, 1962 after 1,138 orbits. It resumed intermittent operation later, transmitting data until November 1962.

Eclipses.—The path of totality of a total solar eclipse began in Borneo (Feb. 5, 1962) and swept by New Guinea and other islands over the International Date Line and across the Pacific (February 4), but ended before it reached North America. It was observed almost entirely from Indonesia, and many excellent photographs were obtained. Sunspot minimum was approaching, so the corona showed strong streamers in the solar equatorial regions.

The period from Jan. 1, 1964, to Dec. 31, 1965, during which the sun is expected to be at the low point of its 11-year cycle of activity, has been set aside as the International Year of the Quiet Sun (*IQSY*) by the International Committee for Geophysics, for intensive cooperative study of the sun, comparable to the previous International Geophysical Year (*IGY*).

Penumbral lunar eclipses, in which the moon enters only the penumbra of the earth's shadow cone, occurred on Feb. 19, July 17, and Aug. 15, 1962. The lunar surface is slightly darkened in penumbral eclipses, but they are of little scientific value. The path of an annular solar eclipse on July 31 began in South America, crossed the Atlantic, and passed over Africa, ending at the island of Madagascar.

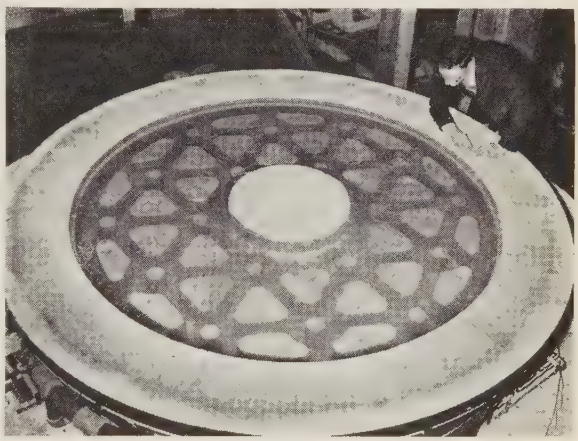
Planets.—The mean distance from the earth to the sun, called the astronomical unit (A.U.), is the fundamental unit of distance in astronomy. By means of echoes from radar signals to Venus, three new values for the A.U. are available, two definitive and one provisional, but all in good agreement. The first, determined at Massachusetts Institute of Technology, gave the distance as 149,597,850 ± 400 km. (92,955,616 ± 250 miles). The second, at California Institute of Technology, gave 149,598,845 ± 250 km.; while the third, at the Moorestown, N.J., station of the Radio Corporation of America, gave 149,596,000 km. A distance based on these values or on data derived from the radial velocities of space probes will probably supersede earlier estimates.

F. R. Zabriskie has made new studies of the atmosphere of Jupiter, based on spectra taken by Karl Keiss. Zabriskie concludes there are 5 km. of molecular hydrogen above Jupiter's cloud level, which is at a temperature of about 170° Kelvin. The period of rotation of the great Red Spot continues to diminish, and its physical nature remains conjectural.

Radar studies of the atmosphere, temperature, and surface of Venus continue. The United States space probe, Mariner II, was launched on Aug. 27, 1962, toward Venus. On September 4 its course was corrected so that it passed about 21,600 miles from Venus on December 14, taking data for 42 minutes on the conditions on that planet. Mariner II carried a 50-pound package of instruments to measure magnetic fields, charged particles, cosmic dust, and sun-emitted protons in interplanetary space; details of Venus' atmosphere and its surface temperature will be deduced from records from a microwave radiometer and its cloud structure analyzed by data from an infrared radiometer. (See also SPACE FLIGHT.)

Comets.—Photographs of Comet Humason (1961e) in July 1962 showed that its coma underwent most curious and unexpected changes when the comet was still 250 million miles from the sun. A plate taken by Elizabeth Roemer on July 10 with the U.S. Naval Observatory's 40-inch refractor at Flagstaff, Ariz., showed a remarkable asymmetrical development of the tail immediately following the coma. By the end of July, the comet's magnitude was 6.5. Spectra showed strong bands in the tail to within 4 minutes of the coma, and carbon dioxide and nitrogen molecules were far stronger than cyanogen. Observers believed the comet had collided with a cloud of strong solar radiation.

George Van Biesbroeck computed an orbit for Comet Bester (1948I), based on 243 days' observations. After perihelion the computed eccentricity



CORNING GLASS WORKS

This 84-inch glass disc will become the primary mirror in a new telescope at the University of La Plata, Argentina.

was slightly greater than 1, so the comet will leave our solar system. Similarly, two computers have found the orbital eccentricity of Comet Arend-Roland (1956h) to be slightly greater than 1. Since this is not due to planetary perturbations, this comet may have originated outside the solar system, or some unobserved factors may have affected it.

A study of Comet Oterma, discovered in April 1943, showed that its orbit has undergone exceptional changes. It was proved that before a near approach to Jupiter in 1936–38, its period was 18 years with a perihelion distance of 5.7 A.U., the largest such value for any known comet. Thanks to enormous perturbations by Jupiter, its period dropped to 8 years and its orbit became more circular, with an eccentricity of only 0.18, so that its perihelion and aphelion distances are only 3.4 and 4.5 A.U., respectively. In 1962 the comet again entered Jupiter's sphere of gravitational influence (within a radius of about 0.32 A.U.) and will remain within it for 18 months. It is computed that by 1964, Oterma's eccentricity will nearly double and that its period will increase to 22 years. By that time the comet will become so faint it can no longer be photographed.

A number of comets were discovered or rediscovered in 1962. Periodic comet Harrington-Abell (1962a) was relocated by Alan McClure of Hollywood, Calif., on January 26, in eastern Orion, at magnitude 17. Periodic comet Tuttle-Giacobini-Kresek (1962b) was rediscovered by Elizabeth Roemer, in Hydra on January 28 at magnitude 18. Comet Seki-Lines (1962c), found independently by Tsutomu Seki of Kochi, Japan, and R. D. Lines of Phoenix, Ariz., in Puppis, on February 4 at magnitude 9, has a very small perihelion distance with a high orbital inclination and direct motion. Comet Honda (1962d) was discovered on April 28 by the Japanese astronomer M. Honda, in Andromeda at magnitude 8. A diffuse comet with a central condensation or nucleus, it had passed perihelion on April 20 at 0.65 A.U. from the sun, and the inclination of its orbit is 73°.

Meteors.—The present knowledge of meteoric bodies, with emphasis on radar studies, was discussed in April 1962 at a symposium at Harvard University. Meteors ranging in size down to magnitude 15 are detectable by radar and show features (such as mass, velocity, and time distributions) similar to those predicted from studies of larger meteors. Their echo rate, however, measured at the same hours for several years, shows day-to-day fluctuations much greater than those of sporadic meteors, with almost no correlation with well-known showers. Meteors of magnitude 15 may come from short-lived showers, of which perhaps 10 occur on a given day, and not from general distribution. Some researchers conclude that almost all of the larger sporadic meteors move in direct orbits, the larger particles mostly near the plane of the ecliptic and those of smaller size almost perpendicular to this plane but still with direct motion. If sporadic meteors move in direct orbits, it is difficult to see how they can originate from comets, about half of which move in retrograde orbits.

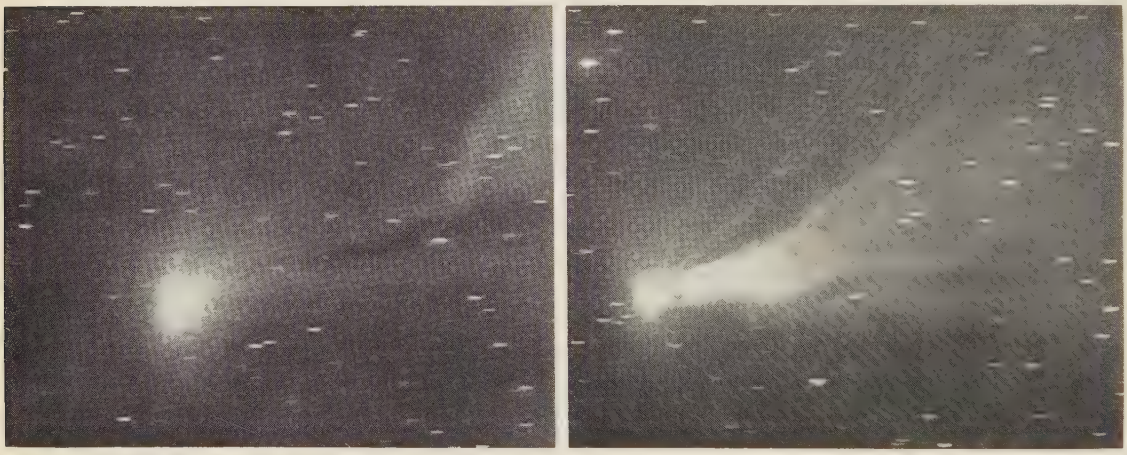
The linear width of meteor trails has been measured, based on photographs of the Geminid meteors in December 1957. The average train width was one meter, although exceptional trains ran to widths of 6 meters.

The earth gains a mass of 10,000 tons of interplanetary dust each day. Comparison with zodiacal light measures of the dust found at 1 A.U. from the sun indicates that the dust has a thousand times greater density near the earth, but the particles are not in geocentric orbits. The reason for this curious contradiction is not known. A micrometeorite collector rocket fired from White Sands, N.Mex., carried a specially prepared particle impactor open from the height of 88 km. to 168 km. and closed at 116 km. on the return, with a total exposure of 4 minutes. About 7 particles per square millimeter were collected, found falling with low velocity. Most were submicroscopic in size and were of three types: high density spheres, medium dense irregular particles, and fluffy particles. Chemical analysis by several methods reveals a variable composition.

Sidereal Universe.—Study of the Great Orion Nebula by T. K. Menon at the National Radio Observatory, Green Bank, W. Va., reveals that the distribution of stars and gas in the cluster tends to support the view that the nebula is relatively young and that its stars have been ionized. Estimates by others of the total mass involved vary from 770 to 3,100 times that of the sun. The time interval since the nebula became ionized is only about 10,000 years.

As now determined, the estimated masses of galaxies depend mostly on measures of their radial velocities. Because of their faintness, adequate spectra are very difficult to obtain, even with the most powerful telescopes. Recent studies of the Virgo Cluster lead to the disturbing conclusion that the mean velocity of recession for 8 of the spiral galaxies of type Sc which have emission lines is $+1{,}100 \pm 150$ km. per sec.; while for 10 others of the same type, but without emission lines, the velocity is $+1{,}800 \pm 250$ km. per sec. The velocities were expected to be the same, since all the objects studied are assumed to be members of the same cluster of galaxies at about equal distances from the earth.

James Lequeux, of the Paris Observatory at Meudon, France, has summarized present knowledge of radio galaxies, among the most interesting of celestial objects. When first studied it seemed that only galaxies with certain peculiarities were strong radio sources. But recent work has shown that an astonishing variety of objects turn out to be radio galaxies, and that they correspond to giant galaxies with great intrinsic luminosity—in fact, the average absolute magnitude of radio galaxies is −20.4. Also, it has been proved that the volume of space from which the radio waves come is far larger than the centrally associated visible galaxy.



ELIZABETH ROEMER, FROM U.S. NAVY

Unusual changes in the coma of Comet Humason are illustrated in these photographs, taken three days apart. (Left) July 7 exposure shows quiescent tail. (Right) Picture taken July 10 demonstrates great activity. Both plates were exposed one hour.

It has been found also that at least 50 percent (and perhaps 70 to 90 percent) of radio galaxies are double. Of the 10 most intense known, only Hydra A appears to be an exception. But it is a mystery why many optically double galaxies are simple radio sources and, inversely, many double radio sources correspond to single galaxies. With no sound current theory of radio galaxies, advances must come from more detailed knowledge of the structure of the larger and nearer ones.

The spectra of the spiral galaxy NGC 1365 show that an enormous variety of streaming motions may exist in it, in addition to circular motion. New work on the star cluster NGC 2158 shows that its distance is 4,900 parsecs and its age about 800 million years. Its structure is similar to that of a globular cluster, because of its radial symmetry and richness. In important aspects it seems to represent a transition between a globular and a galactic cluster.

Supernovae.—F. Zwicky has recently outlined the theories of the development of supernovae. Besides stars and nebulae, gas and dust clouds of varying density occur in various parts of galaxies, and perhaps the vast spaces between galaxies are not wholly empty. When a supernova explodes, vast clouds of dispersed matter are ejected with velocities of the order of 5,000 km. per sec. or more. This material puts the already existing gas clouds into motion on contact with them, and that region of space therefore contains less matter to exert gravitational force. Hence stars with initial high velocities may escape from the region entirely. Since some star clusters are rich in interstellar gas and dust, such an explosion within might sweep the cluster clear, destroy the internal equilibrium, and permit the stars to disperse. Perhaps even chain reactions occur, as in NGC 3184, where supernovae occurred in 1921 and 1947. When one supernova explodes, the immense energy released may be sufficient to act as a trigger on another star in just the right critical state.

Another theory is that supernovae may be the result of the collapse of immense gas clouds, where the total mass involved would amount to that of thousands of suns. Chains of supernovae might well result from the collision of galaxies, after which stars and gas clouds would be relatively more crowded than before, and the explosion of one supernova could well start the chain reaction. Also in such circumstances the nuclei of the galaxies might be dispersed, forming new, smaller galaxies or the curious bridges seen between or within certain types of galaxies.

The Crab Nebula in our galaxy, the remains of a supernova observed in China in 1054 A.D., is one of the strongest radio sources. Remarkable changes in brightness are now being observed in certain parts of the nebula, the radial velocities of some 200 points having recently been measured by Nicholas U. Mayall of Kitt Peak National Observatory. He concludes that a model of the nebula might be a distorted ellipsoidal shell, somewhat pear-shaped, with parts of some filaments inside. A definite decrease in radio flux has been found when the nebula is occulted by the solar corona.

WZ Sagittae is typical of another type of nova called recurrent, having flared up in 1913 and again in 1946. It turns out to be an eclipsing binary, with a very short period of 81.38 minutes. The light curve does not repeat itself, cycle by cycle, which means that there are intrinsic changes in brightness and flare activity.

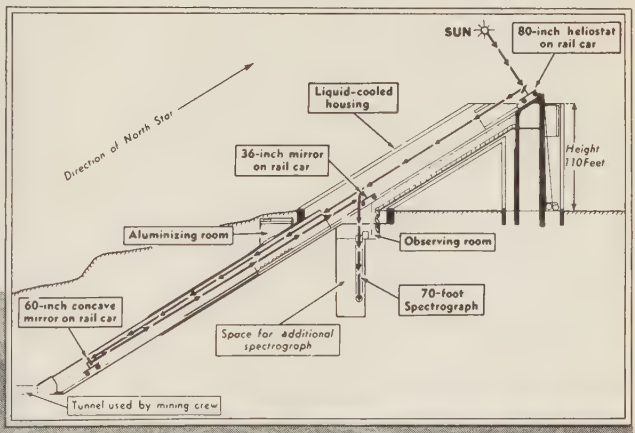
An extensive study has been made of the Class I supernova SN 64, found on June 28, 1959, by M. L. Humason of Mount Wilson and Palomar Observatories. Its magnitude was 14.0 on discovery, while the integrated magnitude of the barred spiral galaxy in which it appeared is only 15.4. The spiral's absolute magnitude is −17.0 and its distance is probably 29.9 parsecs, derived from the radial velocity of +2,990 km. per sec. shown by its spectrum. A plate taken on June 9, 1959, shows the supernova at less than magnitude 20.5, so its increase in 25 days or less was at least 6.5 magnitudes. At maximum, its absolute magnitude was −18.4 or roughly four times brighter than its parent galaxy. This supernova was 2 billion times brighter at its maximum than our sun, which has an absolute magnitude of only +4.85.

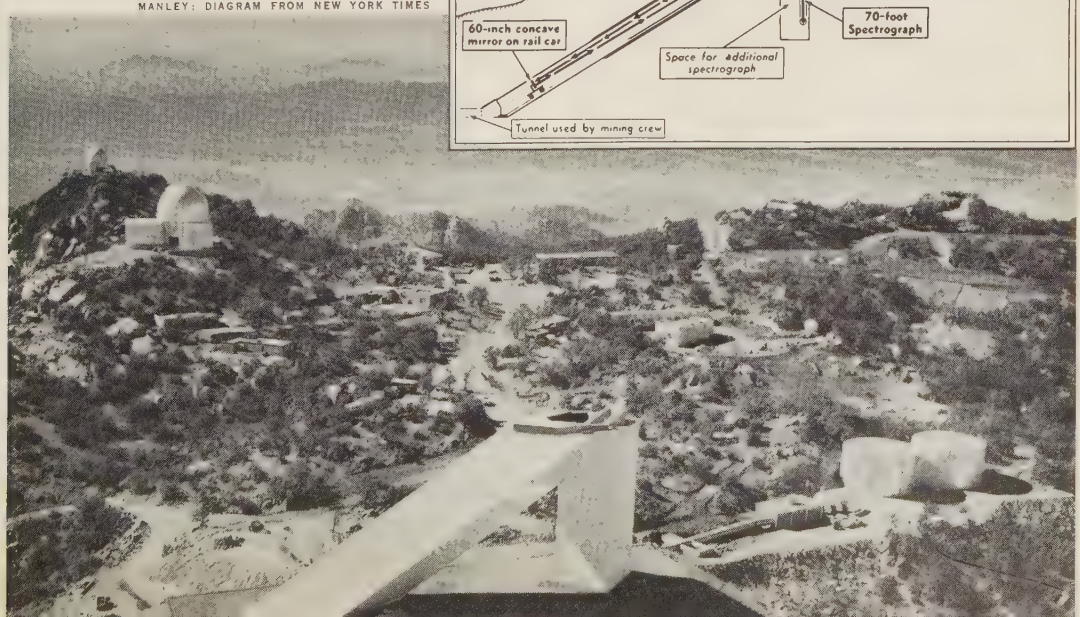
A supernova of magnitude 14 has been discovered in NGC 3938 by P. Wild. Another supernova, of magnitude 13, was discovered on June 28, 1962, by Enrique Chavira at the National Astrophysical Observatory, Tonantzintla, Mexico, in an unnamed spiral galaxy in the constellation Virgo near NGC 5134.

Observatories.—Rapid progress is being made at Kitt Peak National Observatory, 40 miles southwest of Tucson, Ariz. The McMath solar telescope, named for the late astronomer, Robert R. McMath, began operating in Decem-

World's largest solar telescope, under construction at Kitt Peak near Tucson, Ariz. (below), has 500-foot tunnel, partly underground, aimed toward North Star. Sunlight is directed into the shaft by movable mirror, and is then reflected into a 70-foot spectograph for study, as shown in diagram (right).

MANLEY: DIAGRAM FROM NEW YORK TIMES





ber 1962. This is the world's largest solar telescope. Partly tunneled beneath the summit of the 6,800-foot peak, it produces an image of the sun 33.5 inches in diameter, and its spectroscope yields a 70-foot spectrum. The mounting and mirror for an 80-inch stellar telescope are also being installed on Kitt Peak. It should be in operation with its interchangeable Cassegrainian and coudé optical systems early in 1963. Both instruments are federally financed and will be operated by a team of scientists from nine universities.

The radio telescope with the world's largest movable dish antenna was placed in operation in September at the National Radio Astronomy Observatory near Green Bank, W. Va. Covering wavelengths up to 40 cm., its paraboloidal antenna is 300 feet in diameter and 23 stories high when pointed at the zenith. The antenna swings north and south only, in the meridian, but has a resolution 10 times that of previous instruments. It is believed that the 140-foot, fully steerable radio telescope under construction at the same location will be completed in 1965. The similar 600-foot telescope project at Sugar Grove, W. Va., was canceled in 1962 because of engineering difficulties, increased cost estimates, and developments in satellite and electronic technologies which in part replaced it. The world's largest movable, high-powered dipole antenna system, covering 22 acres, is being operated by the National Bureau of Standards (q.v.) and the Instituto Geofísico del Peru near Lima, Peru. (See also ATMOSPHERE RESEARCH.)

At the Karl Schwarzschild Observatory in Tautenburg, East Germany, a reflecting telescope has been installed with a 200-cm. (78.7-inch) mirror and mounting designed and built by Carl Zeiss Jena. Its interchangeable Schmidt, Newtonian, Cassegrainian, and coudé optical systems permit a variety of astronomical and astrophysical functions. Two similar telescopes are being built for the Soviet Union and another for Czechoslovakia.

A 48-inch Canadian reflector, four years in the making, was completed early in 1962 at the Dominion Astrophysical Observatory near Victoria, British Columbia.

Emeritus Professor of Astronomy and Former Director of Flower and Cook Observatories, University of Pennsylvania.

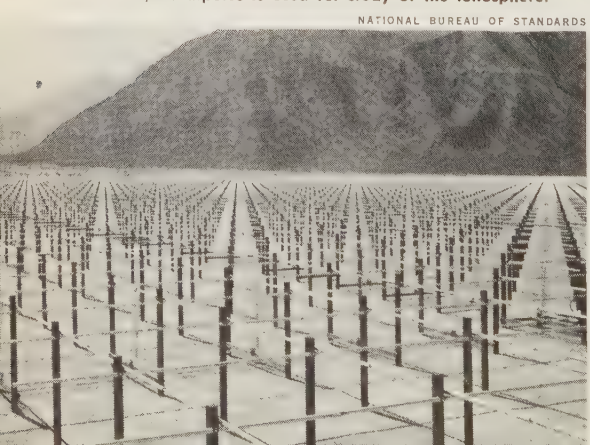
ATMOSPHERE RESEARCH

Progress in the atmospheric sciences was steady, and at times spectacular, during 1962.

Scatter Radar.—The world's largest movable, very-high-powered antenna system, operating at 50 megacycles per second, has been built at the magnetic equator near Lima, Peru. It is operated jointly by the National Bureau of Standards (q.v.) and the Instituto Geofísico del Peru. The antenna consists of an array of 18,000 dipoles covering 22 acres, half the array with east-west and half with north-south polarization. The antenna has a peak power of 6 million watts and by proper phasing can be shifted into the vertical by about 6 degrees. By pulsing energy into the antenna as a transmitter and then using the antenna system as a receiver, the energy backscattered from irregularities of electron density in the ionosphere can be recorded. The power returned to the antenna from any height is directly proportional to the electron density. By this means the electron-density distribution throughout the ionosphere and the exosphere have been measured from as low as 150 km. to as high as 3,000 km.

Covering 22 acres near Lima, Peru, radio telescope antenna with 18,000 dipoles is used for study of the ionosphere.

NATIONAL BUREAU OF STANDARDS



Artificial Radiation Belt.—Immediately following the high-altitude nuclear detonation above Johnston Island in the Pacific Ocean on July 9, 1962 (see ATOMIC ENERGY), very strong, highly polarized radio emissions were observed with the scatter radar antenna system located near Lima, Peru, and with riometers in Peru. Riometers are radio receivers which normally record the strength of cosmic noise at 30 megacycles per second from radio stars, and the absorption of this cosmic noise by the ionosphere. The radio emissions were synchrotron radiation emitted by relativistic electrons created by the bomb and then trapped in the earth's magnetic field. The trapped electrons spiral along the magnetic field lines and simultaneously drift toward the east. The first large peak in the noise records, 6 minutes after the detonation, corresponded to the first pass of the electrons overhead at Peru. A second peak in the radio noise recordings occurred about 25 minutes later after passage of the electrons completely around the world. Calculations showed that a total of 2×10^{24} electrons with energies of 1 Mev. or greater were trapped in the belt. The decay rate of the trapped electrons is very slow; after one month only about one third of the excess radio noise had disappeared. This would indicate that at the end of one year 10 to 20 percent of the synchrotron radiation noise will be present at the equator.

This artificially generated belt of radiation of high-energy electrons is situated within the inner Van Allen belt, at a height above the equator of 1,500 km., and has minimum mirror altitudes at about 1,000 to 1,200 km. The presence of this belt has caused the rapid deterioration of solar cells in orbiting satellites and the postponement of certain future satellite launchings. In order to study the new belt further, a specially instrumented Explorer satellite was launched into a highly eccentric orbit on Oct. 2, 1962.

Rainfall and Lunar Cycles.—An extremely detailed analysis of rainfall data from a 50-year period (1900–49), including 16,057 maximum precipitation records and 1,544 weather stations for the United States, has shown a very high correlation between periods of excessive precipitation and the period of the moon. There is a marked tendency for extreme precipitation in North America to occur near the middle of the first and third weeks of the lunar month, especially on the third to fifth days after the new and full moon. The second and fourth quarters of the lunar cycle are correspondingly deficient in heavy precipitation. A similar Australian analysis of rainfall data from 50 stations in New Zealand for the years 1900–25 showed the same correlation between rainfall maxima and lunar cycle. Not yet explained, the correlation will have considerable influence on atmosphere research as investigators seek an answer.

Equatorial Stratospheric Wind Oscillation.—An important revision in our understanding of the mean zonal circulation of the tropical stratosphere has been due to the discovery by R. J. Reed and D. G. Rogers, University of Washington, of a strong 26-month period of oscillation in the wind pattern. This feature consists of alternate easterly (from the east) and westerly bands of wind which encircle the globe, appearing first at the highest levels observed (about 30 km.) and progressing downward at a speed slightly greater than 1 km. per month. The amplitude is largest in the stratosphere above the equator, decreases slowly in the poleward direction, and disappears by about latitude 30°N. The long-term mean wind values still remain everywhere easterly in the equatorial stratosphere; they increase with height, and are strongest between latitudes 10°N. and 15°N. The amplitude of the annual cycle rises from near zero at the equator to a maximum of about 10 meters per second at approximately 25°N. The peak easterlies occur in late July or early August.

Magnetic Waves Heat Atmosphere.—The top of the earth's atmosphere may be heated partly by magnetic waves rolling in from space, rather than solely by ultraviolet solar radiation as previously thought. Evidence for this comes from observations of the drag on earth satellites due to the upper-air density, in turn controlled by temperature.

Particles (protons and electrons) are streaming outward from the sun as a continuous solar wind which at times increases sporadically by great eruptions from sunspots located in the so-called M regions on the sun, whose emissions produce magnetic disturbances on earth every time they swing in line with this planet. Most of these particles are deflected around the earth by its magnetic field. However, this bombardment and resulting deflection of the field produces hydromagnetic waves that flow into the upper atmosphere and generate heat. The heat then flows into the atmosphere both by wave propagation and by conduction. Only at considerably lower heights, below about 125 miles, does the ultraviolet heating take over in its role of warming the earth. A 27-day cycle and an 11-year cycle in the air density at great heights can be attributed to the solar cycle and resulting magnetic waves. Some investigators believe that the differences in upper-air densities between the daytime and the nighttime portions of the earth can also be explained in this way.

DAVID M. GATES,
Consultant to the Director, Physics of the Atmosphere, Central Radio Propagation Laboratory, National Bureau of Standards, Boulder, Colorado.

ATOMIC ENERGY

Many significant international developments occurred in the field of atomic energy during 1962, including the design and completion of varied types of nuclear reactors, successful accelerator research into the heart of the atom, and large-scale testing of nuclear weapons and other devices.

U.S. Atomic Energy Commission.—In May, the five commissioners unanimously recommended that, in order to effect more efficient management of the United States program, the commission be reorganized with a single administrator. Although the proposal had the support of the president, the congressional Joint Committee on Atomic Energy (JCAE) suggested that it be shelved until next year to allow further study. Early in June, John S. Graham, whose term in office normally would have expired at the end of the month, resigned from the commission. Loren K. Olsen continued to fill out his term until the end of the month. These commissioners were replaced by James T. Raney, former staff director for the JCAE for over six years, and John G. Palfrey, dean of Columbia College. Other members are Glenn T. Seaborg (chairman), Leland J. Haworth, and Robert E. Wilson.

As a result of a request by the president, the AEC in 1962 started a study of the United States government's position with regard to nuclear power. This study is under the direction of Commissioners Wilson and Haworth. The president also directed the commissioners to study the effects of United States nuclear power policy on foreign relations.

The AEC asked congress for a record $2.7 billion for the fiscal year 1963. The greatest increases over the previous year were in those projects connected with the space applications of atomic energy. The 1963 budget included $75 million for nuclear rocket projects, as compared with $43 million in fiscal 1962. The moneys asked for research and development ($216 million) were at the same level as in the previous year, while the program for civilian reactor development was reduced. The House Appropriations Committee cut $10 million from the physical research program and authorized $60 million of the $95 million asked for the Stanford University linear electron accelerator. The only funds authorized for new reactor construction were $20 million for an organic-process heat reactor; however, a $50 million supplementary appropriation was approved for the Hanford New Plutonium Reactor (NPR), bringing the total money to date for this project to $195 million. After first being turned down in the House of Representatives, Congress finally authorized the sale of nuclear power from the NPR, with the provisions that: (1) any losses to the Bonneville Power Administration must be borne by customers and not by the government; (2) one half of the power generated be available to privately owned power companies.

Nuclear Power.—Three remote-type nuclear power reactors went into operation in 1962. The Air Force PM-1 reactor located on top of Mount Warren, Wyoming; the PM-3A at McMurdo Sound on the edge of the Ross Ice Shelf in Antarctica; and the SM-1A at Fort Greeley, Alaska. The PM-1 reactor is being used as the main power source for the Air Force base at Sundance, Wyo. The PM-3A is used to provide process steam for the desalinizing of sea water at the Antarctic base. By this means, 14,000 gallons of fresh water are produced each day.

Consolidated Edison's 163-Mw(e) (electrical megawatts) pressurized water reactor at Indian Point, Buchanan (near Peekskill), N.Y., went critical early in August 1962. The project initiated in 1954, with construction costs of $121 million, was expected to supply power to New York City sometime early in 1963. Also in 1962 the duPont Company completed a Heavy Water Components Test Reactor (HWCTR) at the AEC's Savannah River, S.C. plant. The $9.5 million test facility will be used to test fuel elements for new power-reactor designs.

Ten nuclear power plants, two of which were cooperative, were producing commercial power on a regular basis in the United States at the end of 1962, and two test plants were being run by the government. Nine other plants were planned or under construction by electric power companies, and five others by governmental or cooperative organizations; all of these are expected to produce commercial power. When in full operation, the 26 nuclear power plants will have a combined capacity of 3.5 million kw. The table on page 74 shows the principal plants in the United States nuclear power program presently operating and scheduled. (See also ELECTRICAL INDUSTRIES; PUBLIC UTILITIES.)

Great Britain's Advanced Gas-Cooled Reactor (AGR) prototype went critical at Windscale, Cumberland, England, in August. This reactor is one of two systems (the other being a heavy-water type) which the United Kingdom expects to use for the next generation of power reactors. It is expected that the 27-Mw(e) prototype will be operated for at least one year before a decision is reached on further development. The United Kingdom also approved the construction of an 800 Mw(e) nuclear station at Wylfa Head, Anglesey, Wales. This is Britain's ninth large nuclear power project and will bring the electrical output to 4,500 mw., to be on the British power grid by 1967.

The Canadian Nuclear Power Demonstration station (NPD) near Rolphton, Ontario, went critical in April and reached its full power output in June, using uranium dioxide fuel elements and a heavy-water moderator. Canada also approved the construction of an organic engineering test reactor (OTR), to be built at its new Whiteshell Labora-

NUCLEAR POWER PLANTS IN THE UNITED STATES AND PUERTO RICO
(In operation or under construction, design, or negotiation at the end of 1962)

(Source: Edison Electric Institute.)

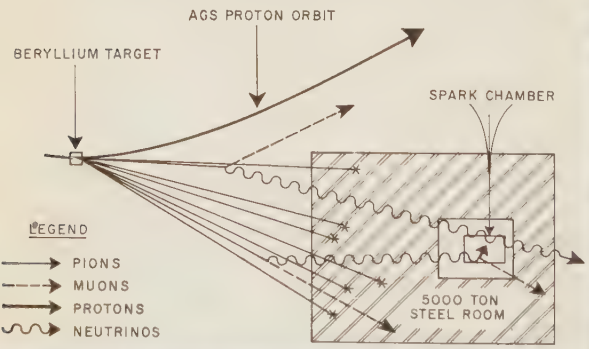
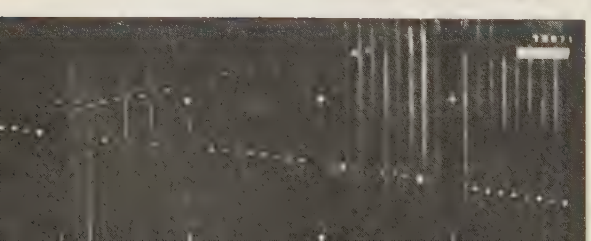
tory 60 miles northeast of Winnipeg. The Swiss began work at Lucens on their first power reactor, a 6-8-Mw(e) heavy-water, gas-cooled type; completion is scheduled for 1964.

The most notable advance in nuclear technology for 1962 was the acceptance by the Maritime Commission of the merchant ship N.S. *Savannah*, from the N.Y. Shipbuilding Corporation. The *Savannah* went to sea on March 23, 1962, and was taken to full power on April 4. By June 1 the ship had traveled some 5,000 miles under nuclear power without any unexpected shutdowns. Six hundred feet long with a full load displacement of 22,000 tons, the ship has a high degree of maneuverability because of the prompt response of the reactor to changes in load demand. Under normal operating conditions the reactor can supply full power in 30 seconds and cruise at 24 knots.

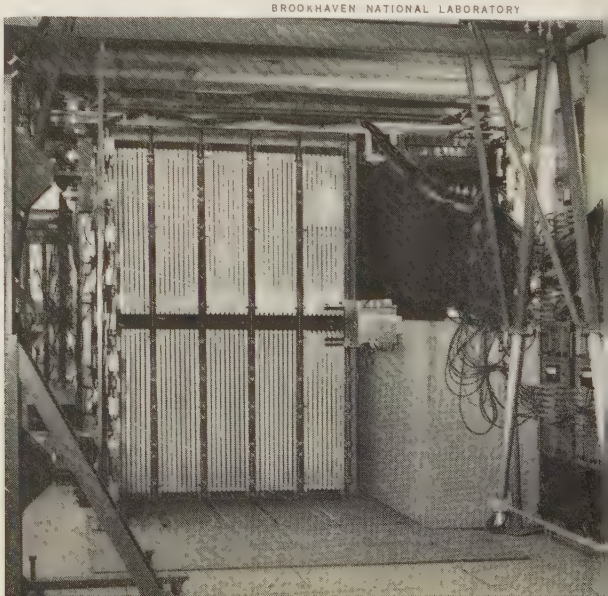
Accelerators.—Construction has started on the two-mile-long, $132 million linear electron accelerator at Stanford University. The tentative schedule called for its completion by 1966. The machine will begin operation with a power supply of 240

Columbia University's 10-ton spark chamber at Brookhaven National Laboratory (*right*) was used for study of neutrinos. Steel shield (diagram, *upper left*) eliminates particles other than neutrinos, one of which created the long straight spark track of a mu-meson (muon) in photograph (*lower left*). Shorter spark track above it may have been created by a gamma ray.





BROOKHAVEN NATIONAL LABORATORY



klystron tubes and produce from 10 to 20 Bev. (billion electron volts) with a beam current of 30 microamperes. Scheduled for early in 1967, experiments will use the electrons to probe the nature of nuclear forces. Measurements of the electron-proton interaction—for the investigation of which Robert Hofstadter of Stanford was awarded the Nobel Prize in 1961—will be extended to higher energies with this machine. Other electron experiments are planned to determine whether present electromagnetic theory is valid at very small distances. The electrons will also produce secondary nuclear particles in great quantities, and these will be available for beam experiments.

The 6-Bev. Cambridge Electron Accelerator (CEA) has begun routine operation for experimenters from Harvard University and Massachusetts Institute of Technology. The 12.5-Bev. zero-gradient proton synchrotron at the Argonne National Laboratory was nearly completed by the end of 1962.

High-Energy Physics.—A puzzle that has bothered physicists for the last five years was finally solved by one of the first experiments performed at the newly completed Brookhaven Alternating Gradient Synchrotron (AGS). It was known that if either an electron or a mu-meson (muon) is absorbed in a nucleus, a neutrino (particle of zero charge and zero mass) is emitted. The theoretical explanation of these processes was based on the assumption that the emitted neutrino is the same for both. A consequence of such a theory is the prediction that the mu-meson should spontaneously decay into an electron and a gamma ray, once in every 10,000 normal decays. However, the electron and gamma ray were not noted in experiments where 100 million mu-mesons were observed to decay. The experimental results, published in July 1962 by a group of Columbia University and Brookhaven Laboratory scientists, showed that the neutrino associated with mu-meson interactions is a different entity from the neutrino associated with electron interactions.

Pi-mesons (pions) were produced by the bombardment of beryllium nuclei by 15-Bev. protons accelerated by the huge AGS. About 10% of these pi-mesons disintegrate during their transit (at almost the velocity of light) from the machine toward the detector. The resulting mu-mesons and neutrinos continue roughly in the same direction, with the 90% of the pi-mesons that have not decayed. About 70 feet from the machine a 42-foot-thick shielding wall was constructed, consisting of about 5,000 tons of iron (old battleship deck plate). This wall is thick enough to stop all particles except neutrinos. On its other side in a well-shielded room is a 10-ton spark chamber which will show a trail of sparks along the path of a charged particle traveling within it. A neutrino interaction would be signified by either a mu-meson or an electron originating within the chamber.

© OAKLAND TRIBUNE FROM WIDE WORLD

Mushroom cloud was made by a United States nuclear test device exploded near Christmas Island in the summer of 1962.

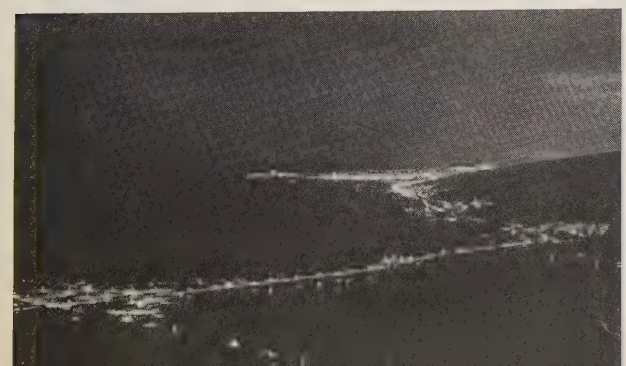
Of 100 trillion neutrinos allowed to pass through the chamber, 50 interacted in it, producing new particles. Of these, 29 show only a single energetic mu-meson being produced, while the remainder show mu-mesons being produced with other particles. In no case was a single energetic electron produced. This demonstrates that the neutrinos arising from the decay of the pi-meson are different from those involved in electron decay. It is thus no longer adequate to speak of a neutrino—it must be labeled as either a mu-meson-type neutrino or an electron-type neutrino.

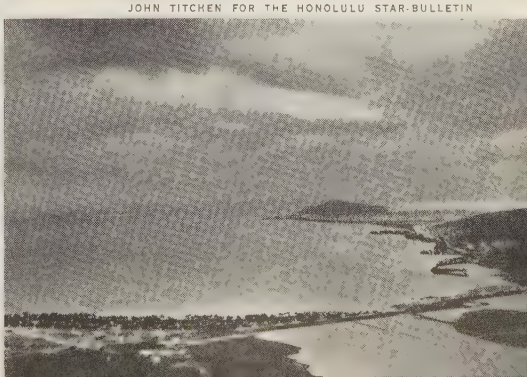
In March 1962, physicists working at Brookhaven and the European Organization for Nuclear Research (CERN) in Switzerland simultaneously discovered one more particle to add to the scientists' zoo of 29 already known "elementary" particles. The existence of the particle, known as the anti-Xi-minus, was predicted from the general principle on which quantum mechanics is based, that for every known elementary particle there must be an anti-particle.

Anti-protons with a momentum of 3.3 Bev. generated in the AGS at Brookhaven were sep-

Night sky over Honolulu, Hawaii (*left*) is brilliantly illuminated (*right*) by explosion of a United States nuclear device over Johnston Island, more than 700 miles away, on July 9. The device was detonated 250 miles above the surface of the earth.

JOHN TITCHEN FOR THE HONOLULU STAR-BULLETIN





arated by an arrangement of magnets and electrostatic separators, and sent through a 20-inch bubble chamber. The anti-Xi-minus particle was found after 34,000 bubble-chamber pictures had been scanned for strange particle production. Each picture contained an average of 14 antiparticle tracks.

The anti-Xi-minus is the heaviest of the predicted elementary particles to be observed. It has a positive charge and a lifetime of about one ten-billionth of a second. At it decays, it disintegrates into a positive pi-meson and a neutral anti-lambda-hyperon. This latter particle then decays into an anti-proton and positive pi-meson. This complex decay pattern is called a cascade. (See also PHYSICS.)

Reactors for Space.—The use of atomic energy for space projects falls into two distinct divisions: (1) the use of reactors as engines for providing the thrust for space vehicles; and (2) the use of reactors and radioisotopes to provide auxiliary power sources for space vehicles. The projects of the first division are being carried out by the Space Nuclear Propulsion Office, headed by Harold B. Finger, under the joint direction of the AEC and the National Aeronautics and Space Administration (NASA). One major program of this office is called Nuclear Engines for Rocket Vehicle Application (NERVA). As part of this program, various Kiwi reactor models were tested in the Nevada desert in 1962 by the Los Alamos Laboratory's Project Rover group. Into these nuclear reactors is injected liquid hydrogen, which is heated to temperatures of the order of 1000° C. and ejected at high velocities to provide the thrust for the nuclear space vehicle. The present plan calls for Project Rover engines to be ready for operational flight test in 1966–67. The Space Propulsion Office granted a contract in 1962 to the Lockheed Missile and Space Company for the design of a vehicle for the NERVA rocket engine. Another major program is called Reactor in Flight Test (RIFT). This project will produce a vehicle that will be used as the third stage of an advanced Saturn C-5 booster.

The second division projects are collectively known as Systems for Nuclear Auxiliary Power (SNAP). Some 20 different development projects were active in this division by 1962, and the AEC decided to put them all under a single director, Richard L. Kirk. Among the larger SNAP projects was SNAP 8, a program assigned to Aerojet General Corporation for developing a lightweight reactor and generating system (30 to 60 kw.) to provide power for large space vehicles. In 1962, NASA renegotiated an $8 million contract to assure that this power source will be operational in five years. Another project called SNAP 50 is a boiling-liquid-potassium fast reactor (300 to 1,000 kw.) using lithium as a coolant. The project is under development at Pratt & Whitney Aircraft with specifications for a weight of 10 lbs/kw. for the unshielded reactor, conversion unit, and radiation shield. (See also SPACE FLIGHT.)

Nuclear Tests.—Many tests of nuclear weapons and other nuclear devices were carried out during 1962. The intensive and large-scale nuclear testing of the USSR from Sept. 1 to Nov. 4, 1961, had broken the voluntary, uninspected test moratorium between the United States, Great Britain, and the Soviet Union in effect since Oct. 31, 1958. About 50 atmospheric explosions were estimated in this Soviet series, topped by the huge device exploded with a force of 58 megatons on October 30. On September 15 the United States began a series of low-yield, underground nuclear tests at its Nevada proving grounds. Eight of these tests, each of less than 20 kilotons, were made in 1961, and the series was continued into 1962, the ninth occurring on January 9. On February 2 the AEC reported that an unannounced (and apparently underground) Soviet nuclear device had been exploded on that day in the Semipalatinsk test area in central Asia.

The first British test of a nuclear device since 1958 was conducted underground at the Nevada proving grounds on March 1. By March 2, 18 tests had been reported in the underground series of the United States, when President Kennedy announced that because of probable Soviet technological advances the United States might have to conduct atmospheric tests. When attempts to reach agreement on an internationally supervised test ban failed, President Kennedy on April 24 authorized atmospheric tests in the Pacific.

The American atmospheric nuclear tests were carried on in the British Christmas Island test area about 1,150 miles south of Hawaii, and in an area near Johnston Island, about 860 miles southwest of Hawaii. The first air test, of intermediate yield, took place on April 25 near Christmas Island. On May 6 a long-range Polaris missile lofted by the nuclear submarine *Ethan Allen* was exploded on target in the Christmas Island area. France conducted its first underground nuclear test (its fifth nuclear device) on May 1 at a site in the Ahaggar Mountains of the central Sahara in southern Algeria.

In the so-called Plowshare series designed to develop the uses of nuclear explosions for peaceful purposes, the second test, an earth-moving experiment, was carried out on the Nevada test site on July 6. Fired in a 635-foot underground chamber, its 100 kilotons blew out a crater 320 feet deep and some 1,200 feet in diameter, 95% of the radioactivity produced being trapped in the earth or quickly returned in the debris.

After two failures at Johnston Island in mid-June, and despite worldwide scientific protests, on July 9 a 1.25-megaton thermonuclear device carried up from Johnston Island by a Thor rocket was exploded at a height of 250 miles above the earth's surface. The test was designed to check the effects of a high-altitude explosion on radio communications and military electronic systems. Auroral and rather short-lived radio effects were noted. On July 11, after the 26th test in the Pacific, the AEC announced that the Christmas Island atmospheric test series had been completed.

On September 1 the United States announced that its high-altitude space shot had intensified the natural Van Allen belt in its lower reaches and extended it inward toward the earth. Observations showed that the artificially created radiation was decaying rather rapidly and was sufficiently high not to affect manned-satellite projects, but it did cripple the British satellite Ariel and the American satellites Transit IV-B and TRAAC. In October, two specially instrumented Explorer satellites were launched into elongated orbits to investigate this artificial radiation and to check whether a high-altitude Soviet blast of October 22 had created more of it. The United States continued its high-altitude series from Johnston Island with successful tests on October 20 and 27, and November 4, reducing the intensity and height of the explosions.

After a set of unannounced, low-yield tests in the Siberian area, the USSR began another series at its test site at Novaya Zemlya in the Soviet Arctic, starting with a 30-megaton explosion on August 5, second only to its largest nuclear shot in 1961. Another large test device in this series was estimated at 17 megatons. The USSR had exploded 32 nuclear devices by November 17. Although Premier Khrushchev had indicated that the 1962 Soviet test series would end on November 20, at least 7 tests were reported up to December 25. In 1961 the Soviet Union had carried out about 50 tests.

On November 4, President Kennedy announced that the United States had completed its series of atmospheric tests in the Pacific and was prepared to negotiate a test-ban treaty. Since Sept. 15, 1961, the United States had carried out 56 low-yield tests at its Nevada test site, all but 3 of them underground; and since April 25, 1962, 36 tests (mostly atmospheric) in the Pacific testing areas of Christmas and Johnston islands. Underground tests were continued at the Nevada test site through the remainder of the year. (See also ATMOSPHERE RESEARCH; CIVIL DEFENSE; DISARMAMENT; SEISMOLOGY.)

Radiation and Fallout.—The fallout effects of the Soviet nuclear tests in the atmosphere during the fall of 1961 were predicted for the spring of 1962. The U.S. Public Health Service monitoring revealed that the strontium-90 fallout levels in the spring appeared to be comparable to those observed in 1959 from the 1958 test series in the USSR. During 1962 the cumulative levels of iodine-131 in milk in some areas of the United States approached the acceptable levels recommended by the Federal Radiation Council for environmental sources generated by peaceful applications and exceeded them slightly in only two areas, Palmer, Alaska, and Salt Lake City, Utah, the Public Health Service reported in November. According to the same report, the amount of radioactive strontium in fallout was well below the yearly dietary levels specified in the radiation guides.

In a report issued June 1, 1962, the council concluded that nuclear testing through 1961 had increased the normal risks of adverse health effects by small amounts, but observed that, compared with the adverse biological effects occurring from radiation sources wholly apart from testing, the additional cases that might be caused by testing are small in number. The National Advisory Committee on Radiation (U.S. Public Health Service) has recommended

the expansion of radiation surveillance activities and more research to develop countermeasures. Radiation research was carried on during 1962 for methods of radiation protection, countermeasures, and techniques for removing radioactive fallout materials from such foods as milk. (See also CHEMISTRY; PUBLIC HEALTH.)

International Atomic Energy Agency.—In 1962, Sigvard Eklund of Sweden assumed the leadership of the U.N. International Atomic Energy Agency (IAEA) as director general. The IAEA fellowship program supported more than 500 scientists and technicians in their studies abroad during 1962. The agency sponsored nine conferences on problems related to atomic energy in various parts of the world and expanded its publications to some 70 in number. During the year, the IAEA carried out an ambitious program of technical assistance to some 25 member countries. A modest new IAEA laboratory at Seibersdorf, Austria, adjacent to the Austrian Atomic Energy Laboratory, serves as a scientific center for the training of scientists from member nations and establishes international standards in the field of atomic energy. Early in 1962 it distributed calibrated samples of radionuclides for testing and calibration of radiation measuring instruments.

European Atomic Energy Community.—On Jan. 10, 1962, Etienne Hirsch, the energetic director of the European Atomic Energy Community (Euratom), was replaced by another Frenchman, Pierre Chatenet. The second five-year budget (1963–67) for Euratom, prepared under Hirsch's direction, amounted to $480 million, but late in June the Council of Ministers approved a budget of $425 million. AUSTRALIA

Lying wholly in the Southern Hemisphere southeast of Asia, the Commonwealth of Australia is composed of the island continent of Australia and the adjacent island of Tasmania. It has an area (including Tasmania) of 2,974,581 square miles, and a population of 10,660,750 (March 31, 1962, est.). Designated a commonwealth on Jan. 1, 1901, when six former colonies were renamed states and united under a federal constitution, Australia is an autonomous member of the Commonwealth of Nations, and a charter member of the United Nations.

Chief among Australia's dependencies (with population as of June 30, 1961) are Christmas Island (area, 64 square miles; pop., 3,099) and the Cocos (Keeling) Islands (area, 5 square miles; pop., 548), both in the Indian Ocean; and Norfolk Island (area, 13.3 square miles; pop., 1,035), in the South Pacific.[1]

Exclusive of full-blood aborigines (estimated at 39,319 in June 1954), the population of the component states and internal territories was as follows in the 1961 census (revised figures):

COMMONWEALTH OF AUSTRALIA

State or Territory	Square miles	Population	Capital (and population)	
New South Wales...	309,433	3,916,907	Sydney	(2,181,211)
Victoria.....	87,884	2,930,244	Melbourne	(1,907,366)
Queensland.....	670,500	1,518,859	Brisbane	(620,121)
South Australia.....	380,070	969,258	Adelaide	(587,556)
Western Australia...	975,920	736,624	Perth	(419,755)
Tasmania.....	26,215	350,322	Hobart	(115,887)
Northern Territory...	523,620	27,139	Darwin[1]	(12,458)
Australian Capital Territory.....	939	58,828	Canberra[2]	(56,430)
	2,974,581	10,508,191		

[1] Municipality of Darwin, created June 28, 1957. [2] Federal capital.

[1] Also administered by the Commonwealth government are the Territory of Papua and the trusteeship Territory of New Guinea (see PAPUA AND NEW GUINEA), the trust territory of Nauru (q.v.), the Territory of Ashmore and Cartier Islands, the Antarctic islands of Heard and MacDonald, and the Australian Antarctic Territory (about 250,000 square miles), comprising the region south of latitude 60°S. and between longitude 160° and 45°E. (other than Adélie Coast).

AUSTRALIAN NEWS & INFORMATION BUREAU

Aerial view of Sydney, Australia, shows artist's concept of Sydney Opera House (foreground), due for 1964 completion.

In 1961 the number of immigrant arrivals was 127,586 (down 11,785 from 1960), of which 72,071 (up 5,258 from 1960) were British immigrants. Other principal groups were: Italian, 17,595; Greek, 8,041; Dutch, 5,610; German, 5,527; Yugoslav, 2,794; United States, 2,533; Polish, 1,481; Spanish, 1,423; Russian, 1,207; Austrian, 1,127; Chinese, 1,060; and stateless, 2,265. Permanent arrivals exceeded departures by 68,439 in 1961.

Government.—The crown is represented by a governor general, who is advised by an Executive Council composed of the ministers of state. Appointed governor general on April 10, 1961, Viscount De L'Isle formally opened the 24th federal Parliament in Canberra on Feb. 20, 1962.

The federal Parliament comprises a 60-member Senate (10 members elected from each state), and an elected 124-member House of Representatives, including 2 nonvoting members from the territories. Authority in limited fields is exercised by state legislatures (bicameral except in Queensland). The government headed by Robert G. Menzies (prime minister since Dec. 19, 1949) was returned for a fifth successive term at the Dec. 9, 1961, election, but with its House majority reduced to 2 (to 1 after the choice of a speaker). By winning 2 doubtful seats in Victoria and Queensland, the government coalition of Liberal and Country parties held 30 seats in the Senate which convened on July 1, 1962. An equal number of seats were held by the opposition, which comprises the Australian Labour Party (28 seats), Democratic Labour Party (1), and independent (1).

Education and Religion.—As of Dec. 12, 1961, state schools numbered 7,867 with 56,702 teachers and 1,612,281 pupils; nongovernment schools numbered 2,229 with 17,795 teachers and 511,293 pupils. Total enrollments at universities and colleges in 1960 numbered 53,780 (including 147 postgraduate students). University teaching staffs aggregated 4,986, and a total of 4,577 degrees were conferred in 1960. Government expenditure on higher education in 1960 totaled £A29,686,000. Principal religions (1954 census): Church of England, 3,408,850; Roman Catholic, 2,060,986; Methodist, 977,933; Presbyterian,

Prime Ministers Menzies of Australia (right) and Macmillan of Great Britain meet in London, May 30, to discuss effect on Australia of Britain's joining European Common Market.

WIDE WORLD

870,242; other Christian, 715,743; and non-Christian, 54,817.

Finance.—Government revenue, 1962–63, est.: £A1,973.4 million; expenditure, £A2,091.7 million; deficit, £A118.3 million (£A27 million in 1961–62). Consolidated fund expenditure, 1962–63 est.: £A1,725.8 million (up £A82.8 million from 1961–62), including departmental, £A148 million; defense, £A210 million (up £A6.9 million); national welfare fund, £A387.6 million (up £A22.4 million); payments to the states, £A422.6 million (up £A26 million); capital works, £A180.9 million (up £A6.3 million); war and repatriation fund, £A110.7 million; redemption of loans, £A106 million; grant to Papua and New Guinea, £A20 million; and oil exploration, £A6.7 million (up £A3 million). Consolidated fund receipts, 1962–63 est.: £A1,665.4 million (up £A23.8 million from 1961–62); and public loan raisings, £A215 million (down £A28 million).

Social Welfare.—Commonwealth expenditures on social and health services, 1960–61: £A330,604,000, including age (562,790 cases) and invalid (88,642) pensions, £A157,926,000; widows' pensions (55,436,000), £A13,469,000; child endowment (1,501,180 claims covering 3,313,225 children), £A74,303,000; maternity allowances (on 236,678 single, and 2,706 multiple births), £A3,898,000; unemployment (161,113), sickness (58,184), and special (14,001) benefits, £A7,140,000; hospital benefits, £A20,668,000; pharmaceutical benefits, £A20,543,000; war pensions (661,290), £A61,051,000; and service pensions (50,302), £A7,783,000. Assessed social services tax contribution from 4,037,862 taxpayers totaled £A378,219,000.

Defense.—The military forces consist of the regular army (20,443 officers and men as of June 30, 1961), the volunteer Citizens Military Forces (27,545), and the Australian Cadet Corps.

The serving strength of the Royal Australian Navy totaled 18,638 on June 30, 1961. Principal ships of the navy include 1 aircraft carrier (the 16,000-ton *Melbourne;* the former aircraft carrier *Sydney* was converted in 1961 to a fast military transport); 7 destroyers; 4 antisubmarine and 10 other frigates; 2 ocean minesweepers; and numerous auxiliaries. The Fleet Air Arm has 2 operational squadrons, with about 100 aircraft and 1,700 officers and men.

Personnel of the Royal Australian Air Force (RAAF) consists of the permanent air force (15,640 officers and men as of Aug. 1, 1961), the Citizen Air Force (671), and general reserve (14,857). The RAAF is organized into 12 squadrons (3 based in Malaya) and 1 jet fighter squadron. It received from Great Britain in 1962 a number of Bloodhound guided missiles—the first surface-to-air weapons adopted by Australia.

Transportation and Communications.—Federal- and state-owned railways (1960–61): total mileage, 26,243; passengers, 462,979,000 (New South Wales, 253,533,000); freight, 55,362,000 tons; net earnings, £A9,914,000; working profit, £A1,407,490. Domestic airlines: total mileage, 43,780,000; passengers, 2,639,080; freight, 64,020 short tons; mail, 6,150 short tons. Australian international air services: total mileage, 20,068,000; passengers, 291,258; freight, 6,575 short tons.

Highway network (1961): total mileage, 523,000 miles (194,507 hard-surfaced); motor vehicles registered (June 30, 1962), 3,139,264 (automobiles, 2,185,088, including 215,900 new registrations; commercial vehicles, 868,807). Six state and 10 commercial television stations are operated; viewers' licenses (June 1962), 1,424,435; licensed radio broadcast listeners (June 1962), 2,220,462; telephones in use (1960), 2,163,962.

Economic Indicators.—Consumer price index (average of six capital cities in 1961–62 on a base of 1952–53 = 100): food, 125.5; clothing, 112.8; housing, 150.7; household supplies, 112.7; all groups, 124.3. Export price index (1959–60 = 100): 96 for all groups in 1961–62. Savings bank deposits (1961–62): £A1,735 million (£A1,578 million in 1960–61); major trading bank deposits, £A1,807 million. Value of buildings commenced (1961–62): £A543.8 million. Total overseas reserves (Jan. 1, 1962): £A602 million (up £A226 million from Jan. 1, 1961). Total net value of production (1960–61): £A3,401,673,000. Retail sales (representing about 90% of consumer retail expenditure on goods in 1961–62): £A3,735.8 million (£A3,717.4 million in 1960–61).

Manufactures and Mining.—Estimated number of factory employees (1961–62): 1,154,000. Chief industrial products (1961–62): ingot steel, 4,062,000 tons (up 374,867 tons from 1960–61); pig iron, 3,378,000 tons; tin plate, 106,416 tons; superphosphate, 2,592,000 tons; cement, 2,781,000 tons; cotton cloth, 44,198,000 square yards; woolen cloth, 25,069,000 square yards; rayon fabrics, 20,472,000 square yards; boots and shoes, 24,999,000 pairs; clay bricks, 984 million; refined sugar, 552,000 tons; tobacco, cigars, and cigarettes, 55,412,000 pounds; beer, 247,488,000 gallons; soap, 1,176,000 cwt.; newsprint, 89,760 tons; refrigerators, 211,956; washing machines, 226,740; radios, 368,484; and television sets, 294,924. Automotive products: internal combustion engines, 196,632 units; motor vehicle bodies, 152,820; and pneumatic tires, 3,996,000.

Mining and quarrying output, 1961–62 (£A180,898,000 in 1960–61): black coal, 24,588,000 tons (up 1,740,000 tons); brown coal, 16,932,000 tons; lead, 230,580 tons; zinc, 153,744 tons; gold, 1,064,400 fine ounces; silver, 8,085,047 fine ounces (1960); and uranium.

Agriculture and Lumbering.—Wool is Australia's most important primary product. Wool production (1961–62): sheep and lambs shorn, 167,069,000 (163,741,000 in 1960–61); total clip, 1,699,500,000 pounds (1,632,000,000 pounds in 1960–61); average price per pound, 54.4 pence (2.25 pence over 1960–61); total receipts, £A338.59 million (up £A24.11 million, or 7.7%, from 1960–61).

Acreage (in thousands) and production (in thousand bushels) of major grains (1960–61): wheat, 13,895 and 273,716 (up 2,716 from 1959–60); oats, 3,637 and 76,107; barley, 2,830 and 67,970; maize (corn), 185 and 6,244. Acreage (in thousands) and production (in thousand tons) of other major crops (1960–61): hay, 2,973 and 5,079; potatoes, 92 and 451; and sugarcane, 341 and 9,166.

Dairy products (1961–62): butter, 199,975 tons; whole milk, 1,451 million gallons; and cheese, 55,417 tons. Production of fresh meat (1961–62): 1,492,939 tons, including beef, 792,000 tons; mutton, 373,930 tons; and lamb, 213,152 tons. Number of livestock (1962): beef cattle, 13,021,000; dairy cattle, 5,046,000; sheep, 157,714,000; and horses, 562,000. Net value of production (1960–61): agricultural, £A391,861,000; pastoral, £A458,169,000. Production of sawn timber (1961–62): 1,308 million superficial feet.

Electric Power.—Electricity generated for public supply and private use (1961–62): 26,450 million kw.-hr. (23,335 million kw.-hr. in 1959–60).

With the opening in May 1962 by Prime Minister Menzies of the giant Tumet 2 power station, the Snowy Mountains hydroelectric project in southern Australia was half completed. Begun in 1950, the construction of the project will finally cost an estimated £A321 million. The finished section includes the diversion of the Eucumbene River into the Murrumbidgee River, and the completion of three power plants with a combined capacity of 660,000 kw. Aided by a loan of $100 million by the World Bank (approved Jan. 24, 1962), the next phase of operation calls for the construction of three additional large dams, 31 miles of major tunnels, and twin steel pressure pipelines to carry water to the Murray 1 power plant, in which eight 95,000-kw. generating units will be installed. Scheduled for completion in 1975, the project will eventually have a total capacity of 2.5 million kw., and in addition will provide 2 million acre-feet of water a year for irrigation.

Foreign Trade.—Total exports (including re-exports totaling £A26.28 million), 1961–62: £A1,078,066,000 (up £A149.07 million from 1960–61); imports, £A884,793,000 (down £A200.64 million). Wool exports: 1,459,986,000 pounds, £A372,792,000 (up 77,009,000 pounds and £A38,350,000 from 1960–61). Other chief exports (values in millions): wheat, 5,452,867 tons,

£A142.44 (up 1,353,496 tons and £A40.31); wheaten flour, 1,215,170,000 pounds, £A18.16; barley, 701,681 tons, £A14.95; sugar, 827,853 tons, £A33.19; beef, 450,629,000 pounds, £A58.85; butter, 174,736,000 pounds, £A23.54; sheet metal and machinery, £A111.17; iron and steel, £A43.40; ores and concentrates, £A40.43; oils and fats, £A29.54; lead, £A23.51; gold, £A8.97; and pharmaceutical products, £A8.93. Chief imports (values in millions): metal manufactures and machinery, £A315.33; textiles and apparel, £A104.21; crude petroleum, £A75.89; foodstuffs, £A39.38; yarns and manufactured fibers, £A23.46; and tobacco, £A9.74.

Events, 1962.—Returned to power at the December 1961 election, though with the smallest possible parliamentary majority, the Menzies government formulated an economic policy for 1962 with the following objectives: to restrain inflation, continue encouraging immigration, develop internal resources to the full, and maintain a favorable balance of payments.

In 1961 the government had sought to stimulate consumer spending by making large increases in payments to the states and in expenditures on social welfare. Restraints on lending by trading banks were eased. Unemployment (116,000 in December 1961, or about 2.8% of the labor force) nevertheless continued to rise, and in January 1962 reached 131,496—the highest figure since World War II. Accordingly, the new administration announced on February 7 a rebate of 5% on personal income tax, a 30% reduction of sales tax on automobiles, grants equivalent to $225 million to the states for public works and housing, and increases in unemployment benefits. The economy immediately showed signs of recovery. A fall in unemployment to 112,000 was registered in February, and a further drop to 101,093 was recorded in March. There was a corresponding rise in factory production, in new automobile registrations, and in building construction. The lending market was buoyant; and at the end of April, Australia's total reserves stood at £A761 million. By mid-1962, government economists were predicting an approaching boom.

In the summer, Prime Minister Menzies visited the United States and conferred on three occasions (June 18–20) with President Kennedy in Washington. The main topic of their discussion was problems affecting the United States and Australia arising from Great Britain's proposed entry into the European Economic Community. Later the impending move by Britain was again discussed by Menzies at the conference of Commonwealth prime ministers in London in September.

Col. John H. Glenn, in all three of his orbits of the earth on February 20, passed over Western Australia. (See Space Flight.) On the first orbit, Colonel Glenn, who was in touch by radio with his fellow astronaut, Maj. Gordon Cooper, stationed at the Muchea tracking station, asked the latter to thank the people of Perth for "turning on the lights"—a unique salutation visible to Colonel Glenn 135 nautical miles above the city. Later, President Kennedy formally thanked the Australian government for its cooperation.

A syndicate of the Royal Sydney Yacht Squadron attempted unsuccessfully in September to win the most coveted yachting trophy, the America's Cup, from the United States. Although defeated 4 to 1 in a series of races off Newport, R.I., the Australian challenger, the 12-meter sloop *Gretel*, won wide acclaim by winning the second race on September 18—the first victory of a challenger in 14 cup series since 1934. The 1962 Empire and Commonwealth Games were held in Perth in November–December under the sponsorship of Prince Philip; athletes of 35 member nations participated. A total of nine world records and 39 Empire Games marks were set, and Australia supplanted England for the first time in the history of the games as the top sports nation of the Commonwealth by winning 38 gold medals to England's 29. It was resolved that the 1966 games would be held in Kingston, Jamaica. (See also Sports, Games, and Shows.)

The Commonwealth government gave permission to the United States on May 17 to establish a naval communications station at North West Cape, Western Australia. In August a team of five United States scientists began to inspect possible sites for a third American tracking station in Australia to support the man-in-space program.

AUSTRIA

As established by the state treaty of July 27, 1955, Austria has the frontiers of Jan. 1, 1938 (1,648 miles), with an area of 32,375 square miles. By a parliamentary declaration of June 7, 1955, it is a neutralized state. According to the census of March 21, 1961, the population totals 7,073,807. Leading cities are Vienna, the capital, 1,627,566; Graz, 237,080; Linz, 195,978; Salzburg, 108,114; Innsbruck, 100,695; and Klagenfurt, 62,218.

Government.—Dr. Adolf Schärf (Socialist) was elected president for a 6-year term on May 5, 1957. In April 1961, Dr. Alfons Gorbach (People's Party) succeeded Julius Raab as chancellor, and his reorganized coalition cabinet consisted of five other representatives of the People's Party and six Socialists. This cabinet continued in office through the end of 1962, while negotiations continued for the formation of a new postelection government under the leadership of Dr. Gorbach.

An extraconstitutional Coalition Committee, which is composed of an equal number of representatives from both coalition parties, has developed much power in recent years. No important legislation is submitted to Parliament before this group approves it, and the committee exercises strong party discipline in the chambers.

The Upper Chamber, the Federal Council, is composed of 50 members (26 of the People's Party and 24 Socialists) chosen by the nine provincial legislatures, seats being distributed in accordance with the population of each province. Elections to the National Council (National Assembly), the 165-member lower chamber, were held on Nov. 18, 1962, with the People's Party securing (1959 figures in parentheses) 81(79) seats; the Socialists, 76(78); and the Freedom Party, 8(8).

In a rare tribute, former Chancellor Leopold Figl was unanimously elected governor of Lower Austria in February 1962, the Socialist Party deviating for the first time from its established practice of casting blank ballots for a candidate of the opposition party.

Education and Religion.—Education is compulsory for ages 6–14. For the first 4 years pupils attend the *Volksschule*, which in rural regions often continues for another 4 years. Elsewhere pupils attend the *Hauptschule*, which offers a 4-year terminal course and also prepares for trade schools and the *Mittelschule*. The latter, which is of various types, prepares for universities and higher technical schools. Physically and mentally handicapped children attend *Sonderschulen* or special classes attached to the regular schools. Number of schools (with enrollment), 1961–62: *Volksschulen*, 4,525 (544,579); *Hauptschulen*, 854 (197,553); *Sonderschulen*, 132 (22,136); and *Mittelschulen*, 203 (81,537). In the 1960–61 winter semester, 40,815 students (including 10,806 foreigners) attended the 14 Austrian institutions of higher education.

Religious affiliation, 1951 census: Roman Catholic, 6,170,084; Protestant, 429,493; Old Catholic, 32,919; Orthodox, 5,643; Jewish, 11,224; other, 17,450; none, 264,014; unknown, 3,078.

Finance.—The ordinary budget for 1962 (1961 figures in parentheses) provided for expenditures of 52,536.3 (45,098.1) million schillings (S 26 equal U.S. $1) and revenues of S 52,020.3 (44,787.1) million, producing a deficit of S 516 (311) million. To this should be added a deficit of S 1,360 (2,275) million in the extraordinary budget for investments, resulting in an overall deficit of S 1,876 (2,586) million. Savings deposits totaled S 35,929,000 in December 1961 (S 31,380,000 in December 1960). On Feb. 1, 1962, and again on August 1, the

Austrian National Bank raised minimum reserve requirements for credit institutions by 0.5%, to 10% for demand and time deposits and to 8% for savings deposits. Between July 31, 1961, and July 31, 1962, the bank's stock of gold and bullion increased by 43%, to S 10,796 million; the supply of foreign exchange and currencies by 33%, to S 14,890 million; and currency in circulation by 18%, to S 29,871 million.

Transportation and Communications.—Transport network mileage (1961): state-owned, railways, 3,740 (32% electrified); federal highways, 5,742; provincial and district roads, 13,652; superhighways (finished or under construction), 216. Danube freight traffic (1961): 5,493,414 metric tons (6,202,105 in 1960), including 4,159,386 (4,320,635) tons in international trade, 670,100 (692,094) tons in transit, and 663,928 (1,189,376) tons purely domestic. Landings at Austria's 6 airports (1961): 11,312 (9,818 in 1960). In 1962, Austrian Airlines made flights from Vienna to 23 cities in Europe and the Middle East. Motor vehicles of all descriptions (December 1961): 1,010,270 (932,472 in 1960). Television sets (December 1961): 290,899 (13% of all Austrian households).

Economic Indicators.—Gross national product: S 162.2 billion in 1961 (up 9.4% from 1960). Index of industrial production (1953 = 100): general but excluding gas, 186 in 1961 (177 in 1960); mining, including magnesite and petroleum, 116 (114); manufacturing, including stone, clay, and sand quarries but excluding sawmills, printing and publishing, and coal products, 194 (184); electricity, 201 (192). Monthly averages (1961): unemployed, 69,182 (87,959 in 1960); employed, 2,322,200 (2,281,900). Average monthly price index (1958 = 100) for a four-member worker family: 106.4 in 1961 (103.1 in 1960). Average weekly wage (1961): men, S 388 (362 in 1960); women, 317 (293).

Manufactures and Minerals.—Chief products in metric tons (1960 figures in parentheses): pig iron and ferroalloys, 2,268,000 (2,232,000); crude steel, 3,108,000 (3,168,000); copper, 11,880 (11,760); zinc, 12,120 (11,520); lead, 6,480 (8,400); aluminum, 67,680 (67,920); cement, 3,084,000 (2,832,000); paper, 507,204 (490,500); iron ore, 3,696,000 (3,540,000); coal, 106,800 (132,000); lignite, 5,664,000 (5,976,000); raw magnesite, 1,798,680 (1,625,400); raw graphite, 80,976 (88,032); crude oil, 2,355,864 (2,448,396); natural gas, 1,542,350,468 cubic meters (1,469,192,736); electric power production (excluding production for traction purposes for the railways and by industry for its own consumption): 13,738.8 million kw.-hr. in 1961 (13,117.2 million in 1960), including 10,296 (10,332.8) million hydroelectric; exports, 2,533 (2,428) million; imports, 101 (147) million.

Agriculture and Forestry.—Agriculture and forestry account for 11.4% of the gross national product, and Austrian farms produce about 90% of the nation's food requirements. Production in thousands of metric tons in 1961 (1960 in parentheses): wheat, 712 (702); rye, 472 (353); barley, 512 (589); oats, 340 (343); corn, 198 (213); potatoes, 3,395 (3,749); sugar beets, 1,225 (1,906). Wine production, above average both in quantity and in quality, amounted to 1,328,211 hectoliters in 1961 (897,487 in 1960). Wood cut: 10,070,394 cubic meters in 1961 (10,015,925 in 1960).

Foreign Trade.—Imports in 1961 (1960 in parentheses): S 38,604 million (36,812 million); by volume, 12,956,000 metric tons (13,502,000). Exports in 1961: S 31,262 million (29,119 million); by volume, 6,973,000 metric tons (7,238,000). Percentages of total imports from various groups in 1961 (1960 in parentheses): Organization for Economic Cooperation and Development (OECD), 74 (70); European Free Trade Association (EFTA), 12.7 (12.1); European Economic Community (EEC; Common Market), 59.5 (56.5); eastern Europe, 12 (13.1). Percentages of exports: OECD, 67 (65); EFTA, 14.4 (12.5); EEC, 49.5 (50.2); eastern Europe, 17.5 (16.1). Imports, first 6 months of 1962 (1961 in parentheses): S 19,408 million (19,109 million); exports, S 15,962 million (15,142 million). On Jan. 1, 1962, and again on September 1, Austria reduced tariffs and liberalized quota restrictions.

Events, 1962.—The tapering off of the economic boom that had begun in the second half of 1961 continued into the new year. Meanwhile, the shortage of workers was alleviated to some extent by the increased numbers of women who took employment. On June 15, the International Bank for Reconstruction and Development made a loan equivalent to $5 million to the Österreichische Investitionskredit, A. G. (Austrian Investment Credit Corporation). This loan, together with S 40 million in counterpart funds that the government agreed to make available, was to be lent in turn to private Austrian industrial enterprises. As of August 1, Austria accepted the obligations on convertibility of its currency set forth in Article 8 of the Articles of Agreement of the International Monetary Fund.

An unusual rise in prices in the first months of the year resulted in a wave of strikes. Metal, postal, and telegraph workers, physicians, and policemen all struck for higher wages. Among the more spectacular strikes was the 24-hour protest staged by physicians in Vienna on July 9, which was supported by their colleagues throughout Austria. The Health Insurance Institute, under which all workers and employees in the country are insured, refused to meet what were considered exorbitant demands. The strike was denounced by the trade unions, and the dispute was settled on July 26 by a moderate increase in physicians' fees. In the first days of August, police in Vienna and other cities turned their traffic lights to blinking yellow and left their posts for some hours at the height of rush periods. Customs officials staged a go-slow campaign, causing long lines of cars to form at border points. On August 8, Chancellor Gorbach agreed to enter into negotiations on these demands for wage increases.

The People's Party had opposed such increases, while the Socialists had supported them with the exception of the doctors' demands. The People's Party also attacked the handling by Foreign Minister Bruno Kreisky (Socialist) of the negotiations with Italy concerning the South Tirol and of Austria's request to be admitted to associate membership in the Common Market. These differences culminated in an agreement by the two parties to advance parliamentary elections from the spring of 1963 to Nov. 18, 1962. It was considered that it would be advantageous to have a new Parliament and a new government when serious negotiations with the EEC got under way in 1963. Accordingly, on July 25, Parliament was dissolved.

On January 19, Dr. Kreisky criticized certain Common Market officials as well as George W. Ball, United States under secretary of state, for their negative views on granting special concessions to such neutralized states as Austria, Switzerland, Sweden, and Finland as prospective associate members of the Common Market. On July 28, when Austria and Sweden presented their case for associate membership to the EEC Council of Ministers, they received a friendly hearing but no commitment. Great Britain has pledged that she will not join the Common Market until the neutral states, now joined with her in the EFTA, have made satisfactory arrangements with the EEC. Austria considers membership in the Common Market vital to her continued prosperity.

Paul Struye, chairman of the Council of Europe's special subcommittee on the South Tirol, visited Vienna and Rome and, on January 18, reported to the council that he felt that progress was being made toward solving the problems of this area. In a note of May 22, Austria urged Italy to agree to a meeting of their foreign ministers to consider the results of the Italian government's study commission on the South Tirol. The foreign ministers did meet with their advisers on July 31 at Venice, where it was evident that substantial progress had been made toward reaching an agreement. It was decided that each government would submit statements on the South Tirol to the UN General Assembly, and that the foreign ministers would continue their bilateral discussions in the fall.

On March 27–31, President Heinrich Lübke of the Federal Republic of Germany paid a state visit to Vienna. He was followed in May by Queen Juliana and Prince Bernhard of the Netherlands, and in June by King Frederik and Queen Ingrid of Denmark. Chancellor Gorbach, accompanied by Foreign Minister Kreisky, made a series of important state visits: to Great Britain, on March 21–

22; to the United States, on May 2–5; to France, on June 25–28; and to the USSR, on June 28–July 5. On all occasions the country's future relationship to the Common Market was explored, and Dr. Gorbach reiterated Austria's determination to maintain her neutral status.

During 1962 the United States curtailed its cultural program in Austria. Meanwhile, the Austrian government took a step in the opposite direction by establishing an Austrian Institute, which was to function as the cultural affairs section of the consulate general in New York. New chairs of American studies were founded at the universities of Vienna, Innsbruck, and Graz. In January, the Ford Foundation announced the grant of $1 million for the establishment of an Institute for Sociology, Current History, and Economics in Vienna. In May, the thoroughly renovated 162-year-old Theater an der Wien was reopened.

A rather desultory campaign preceded the National Council elections on November 18. The People's Party increased its representation at the expense of the Socialists, while the Communists, contrary to predictions, failed to win any seats.

AUTOMOBILES

More automobiles were produced in the United States during the 1962 model year than in any other year except 1955. The total passenger car production for the model year was 6,686,749, compared with 5,522,019 in 1961 and 7,920,186 million in 1955.

The high volume of 1962 production and sales was surprising because the relatively new compact cars were not the principal factor in the increase. Standard and medium-priced cars led in sales; the compact cars' share of the total United States market did not exceed one third.

The five automobile divisions of General Motors Corporation showed the largest increases in the 1962 model year. Compared with 1961 production, the 1962 increases in standard General Motors cars were as follows: Chevrolet, 235,000; Pontiac, 140,000; Oldsmobile, 110,000; Buick, 55,000; and Cadillac, 22,500. All of General Motors' four carryover compacts also increased substantially in sales and production. Chevrolet's Chevy II front-engine compact car, in its first full year of production, was third in sales among the compacts.

As reflected by the popularity of General Motor cars, which at times during 1962 sold 55% of the industry, customer tastes were decidedly in the direction of luxury, performance, and convenience. All manufacturers introduced bucket-seat sports cars in response to sales demand. Four-speed manual transmissions and seat-dividing consoles also contributed to the "personal car" trend. The proportion of convertibles increased, particularly among the compact cars. Stark economy models, such as those that increased the sales of compacts in 1960 and 1961, showed somewhat less appeal.

Underlying the strength of the market in 1962 and the fast beginning of the 1963 season was the growing rate of scrapping old cars. More than 5 million cars were sold for junk during the calendar year 1962, a rate unequalled since the days of the post-World War II demand for new cars.

Cars were offered in a great variety of models. Domestic manufacturers offered 320 models for 1963, 24 more than at the end of the 1962 season. Hardtops and convertibles, as well as sedans and station wagons, were available in all sizes of all makes. General Motors' success was attributed by competitors to the fact that its divisions were the first to make available "sportier" models of compacts and higher-priced cars.

Chrysler stopped production of the Lancer compact car, a Dodge product, and Ford postponed the introduction of its Cardinal, a Volkswagen-sized car.

Production.—Car production in 1962 was nearly 25% higher than in the recession year of 1961. Only 5.4 million cars were built in the 1961 model year, partly because of a large carryover of old models at the end of the 1960 model year. The sales of old models at the end of the 1961 season were far more effective, clearing the way for the record production which followed.

In the January–August 1962 period, General Motors' share of new car sales was 52.5%, compared with 45.8% in 1961; Ford dropped to 26.1% from 28.9%; and Chrysler Corporation, to 8.9% from 10.9%. American Motors and Studebaker remained at 6.3% and 1.2%, respectively.

[1] Included in truck figures. [2] Includes 152,087 microbuses. [3] Includes 224,595 three-wheeled vehicles. (Source: Automobile Manufacturers Association.)

At the beginning of 1962 there were 76 million cars, trucks, and buses in the United States (the total was expected to exceed 78 million by the end of the year), including about 6,750,000 new registrations in 1961. Total vehicle registrations in Canada rose to 5,387,000.

Foreign Cars.—Despite a general decrease in the sales of imported cars in 1962, Volkswagen sales increased by about 7%. Imported cars accounted for about 5% of the total United States market through the first eight months of 1962. Total import sales of 227,000 cars for the eight-month period indicated that this market was declining to a rate of about 325,000 a year, continuing a steady decline since the record import volume of 609,000 in 1959. Volkswagen sales volume for the January–August 1962 increased by 9,000 to 128,536. Other imported cars showing increased sales of 1962 models were Triumph and Volvo.

As of Jan. 1, 1962, a total of 2,186,000 imported cars were in operation in the United States. Of these, 673,000 were Volkswagens and 254,000 were Renaults.

The 1962 and 1963 Cars.—The most distinguishing features of 1963 models are the squarish roof line first popularized on the Ford Thunderbird and Galaxie. Amber parking lights, for better visibility, also are standard on all 1963 models, together with crankcase emission devices and seat-belt anchors. Disk brakes are a Studebaker option. General Motors has adopted self-adjusting brakes in an industry trend toward improved safety in stopping. Nine other makes have adopted the Chrysler-pioneered alternator. A tilting steering wheel has been introduced by General Motors.

For sports-car enthusiasts, three new models have entered the market: the Buick Riviera, the Studebaker Avanti, and the Chevrolet Corvette Sting Ray.

Prices remained largely unchanged on 1963 models. There were no major labor stoppages, and new-car warranties were doubled to 24 months or 24,000 miles by all manufacturers but Chrysler, which pioneered a five-year, 50,000-mile warranty on power-train components.

PORT OF N.Y. AUTHORITY

BACTERIOLOGY

Important applications, advances, and discoveries were made in microbiology in 1962.

Microbial Battery.—Microorganisms, like other living cells, obtain energy for their activities from the metabolism of various substrates (foods). During the metabolic process, electrons are transferred, catalyzed by enzymes formed by the cells. The energy changes taking place, when the enzymes of such anaerobic bacteria as the genus *Desulfovibrio* catalyze the utilization of carbohydrate and reduction of sulfate, have recently been exploited in a battery-type, electrochemical system, producing measurable amounts of electricity. Other microorganisms, protozoa, and algae have been used in such experiments, and tests have been made using inorganic materials alone to furnish electrons for the bacteria.

One of these so-called test-tube biological batteries or fuel cells reportedly has produced up to 900 millivolts (thousandths of a volt) of electricity. By connecting several such batteries in series, sufficient electricity has been generated to light a bulb, run a radio, or power a small model boat. Scientists working in this area have great hopes for microbiotechnology to produce a supplementary source of electricity. The plan is to utilize waste products from communities (garbage, sewage) and industry (paper mill wastes), or materials in ocean waters as substrates. Also spacecraft may be equipped with so-called bio-solar cells, which use the wastes of the personnel aboard. Predictions are that the electricity from such systems will be useful to light navigational buoys at sea or to power radio beacons in remote regions and equipment on spacecraft.

Measles Vaccine.—Measles, a universal disease of children, is a serious illness and may cause severe complications, such as brain-damaging encephalitis and fatal pneumonia. The measles virus has been cultivated in living tissue-culture cells since 1954, but it took over two years of careful work to attenuate the virus so it could be used safely in trial experiments on children. Further research was then necessary to develop an effective vaccine. Reports became available in 1962 on thousands of children carefully studied. Results made it clear that John F. Enders' measles vaccine is 95 percent effective in stimulating production of antibodies that should give permanent immunity. But because of mild reactions in some children and certain technical problems, it may be two years before a thoroughly effective and safe vaccine is generally available.

Infectious Hepatitis Virus.—Disease caused by the infectious hepatitis virus is on the increase, and over 70,000 cases were estimated to have occurred in 1962 in the United States. Microbiologists isolated several strains of the virus by the tissue-culture technique, and studied the neutralizing antibodies produced during the course of the disease. Attenuated strains of the virus were given as a vaccine to volunteers, but results showed protection to be so variable that a generally useful vaccine against this disease has not yet been produced.

Microbial Genetics.—Microorganisms are widely used in genetic studies, as well as in cytology, enzymology, physiology, and the study of infectious diseases. For example, enzymes are synthesized at structures in the cell called ribosomes by template ribonucleic acid (RNA). In turn, the activities of ribosomes are specified or controlled by the shapes of ribonucleic acids called messenger RNA. The latter is shaped by the genes, by information deoxyribonucleic acid (DNA), on sites of the chromosomes of the cell. The messenger role of RNA has gained support by recent studies which appear to prove that the genetic code is quite similar for widely divergent organisms, and probably is universal. Support for these statements comes from the observation that RNA from tobacco mosaic virus directs a cell-free system (particles) from the bacterium *Escherichia coli* to form a protein that closely resembles the protein normally formed by tobacco mosaic virus RNA as it attacks the tobacco leaf.

It now appears that virus (bacteriophage) infection at the cellular level consists of the introduction of a fragment of genetic material (nucleic acid) into the host cell (bacterium). The genetic material is delivered into the host cell by a specialized structure (virion or virus particle) which carries the information needed to produce new virus. This may mean that to cure virus diseases in animals, plants, and man we will first have to learn to affect selectively the intimate process of gene function and regulation. (See also BIOCHEMISTRY; GENETICS.)

Extraterrestrial Microorganisms (Exobiota).—Much thought was given in 1962 to the sterilization of spacecraft likely to land on the moon or planets, in order not to contaminate them from earth. Mechanical devices are being designed to pick up uncontaminated lunar dust and place it under a microscope to be examined for microorganisms by television. Concern has also been expressed regarding the possible hazard of back contamination of the earth by spacecraft returning from another planet. Such exobiota may grow better on earth than native microorganisms and thereby cause diseases.

BAHAMAS

Comprising 20 inhabited islands and 661 uninhabited coral reefs, the Bahama Islands extend

for 750 miles in the Atlantic Ocean, from 50 miles east of Florida to about 70 miles northwest of Haiti. The aggregate land area is 4,404 square miles, and the population totals 109,622 (1961 est.), of which 80% is Negro. Nassau (1961 est., 54,557), chief port of New Providence Island, is the capital of this British crown colony. Other principal islands and populations (1953 census): Andros, 7,136; Eleuthera, 6,070; Grand Bahama, 4,095; Long, 3,755; Great Abaco, 3,407; Cat, 3,201; Exuma, 2,919; and Acklins, 1,273. Joint naval and air bases and a research station are maintained by the United States and Great Britain.

Government.—The Bahamas are administered by an appointed governor (Sir Robert Stapledon), who is advised by a 9-member Executive Council. There is a Legislative Council of 11 nominated members and a House of Assembly of 33 elected members (see below, *Events, 1962*).

Education.—Primary education is free and compulsory. In 1961 there were 147 government schools (18,796 pupils) and 51 denominational and private schools (7,517 pupils). Government expenditure on education was £625,061 in 1961.

Finance.—Government revenue, 1961: £8,563,582 (£7,988,620 in 1960); expenditure, £8,574,914 (£8,337,188). British currency is legal tender, but United States and Canadian currencies are also circulated.

Transportation and Communications.—The Bahamas have no railroads. There are 218 miles of public roads (137 asphalted) on New Providence, and good roads are maintained on Eleuthera and Grand Bahama islands. Overseas air service is furnished to Nassau International Airport by Pan American World Airways (from Miami, Fla., and New York), Mackey Airlines (from four Florida cities), British Overseas Airways Corporation (from New York, London, Jamaica, and Bermuda), and Trans-Canada Air Lines (from Montreal and Toronto, Canada, and Kingston, Jamaica). Bahamas Airways provides scheduled service within the islands. Worldwide radiotelephone service is provided, and there were 12,668 telephones in use in 1961.

Economy.—Year-round tourism is basic to the economy. Income from tourism was estimated in 1961 at $33 million ($30.5 million in 1960); the number of tourists in 1961 was 314,126 (305,553 in 1960).

Foreign Trade.—Total exports, 1961: £2,959,719 (up 42% from 1960); imports, £30,431,511 (up 30%). Principal exports, 1961: salt, £256,630; pit props and lumber, £199,046; crayfish, £181,782; fresh tomatoes, £115,791. Imports include vehicles, apparel, fresh meats, machinery, cement, and nitrogenous fertilizers.

Events, 1962.—In elections to the House of Assembly on November 26, the ruling conservative United Bahamian Party won 19 seats (an increase of 2 seats); the Progressive Liberal Party won 8 seats (a decrease of 2); Labour received 1 seat; and 5 independents were elected. This was the first election in which women were granted the right to vote.

During the year the Bahamian government protested several times against what it termed a growing tendency on the part of fishermen from Florida to encroach on the territorial waters of the islands.

BAKING INDUSTRY

Baking is the second largest food industry in the United States in value of products, with total annual sales in excess of $5.5 billion. This volume is produced by about 12,000 neighborhood retail bakers and 6,000 wholesale plants, grocery chain bakeries, home-service operators, and multiunit stores. About $1 billion of the total sales are credited to the retailers. Employees in the baking industry number about 331,500, of whom 260,700 are in the wholesale branch and 70,800 in the retail segment. Some 45 million loaves of bread are baked daily. The retail price of white bread averaged 21.2 cents per pound in 1962, as compared with 20.9 cents in 1961.

Trends established in 1961 continued in 1962: increased use of plastic films for packaging, greater consumption of frozen bakery foods, installation of more on-premise bakeries in supermarkets, more bulk handling of materials, and more of the larger bakeries changing over to the continuous process of mixing. The population growth resulted in increased volume of bakery foods, but the actual per capita consumption in 1962 remained about the same as in 1961.

U.S. BAKERY FOODS PRODUCTION, 1961[1]
(In thousands)

Category	Value
Bread and related products	$3,710,522
Bread and bread-type rolls	2,463,981
Sweet yeast goods	346,611
Soft cakes	431,037
Pies	207,059
Doughnuts, cake type	128,674
Biscuits and crackers	1,042,271

BALTIMORE

The sixth most populous city in the United States, Baltimore is Maryland's dominant metropolis. It has a land area of 79 square miles, and in 1960 had a population of 939,024. Baltimore City is the center of a rapidly growing metropolitan area (1,807 square miles; 1960 pop., 1,727,023) which includes Baltimore, Carroll, Howard, and Anne Arundel counties.

The principal sources of Baltimore's economic strength come from the excellent port facilities and diversified manufactures. Leading industries (in terms of value added by manufacture) are primary metals, transportation and equipment, food and kindred products, and chemicals.

Data for Baltimore City, 1961: total civilian employment, 611,600. Department store sales index (1957–59 = 100), 102.0. Freight car loadings, 190,806. Vessel arrivals, 5,132; foreign trade handled, 19,610,000 short tons, valued at $1,085,000,000. Output of electricity, 5,948,510,000 kw.-hr., and sales of gas, 43,571,660,000 cubic feet. Value of investment in new manufacturing plants and plant expansion, $100,883,000. Cost of living index (1957–59 = 100), 104.4.

The government of Baltimore City combines city and county functions. The city is governed by a mayor (in 1962, J. Harold Grady, Democrat) and a 20-member City Council elected on a party basis for four-year terms. Additional elective officers include the comptroller and the City Council president. Practically all departments are subject to the direct authority of a single head appointed by the mayor and confirmed by the City Council.

The net funded debt (Jan. 1, 1962) was $333,718,950. The property tax rate in 1962 was $3.91 per $100 of assessed valuation. The 1962 budget was $302,522,672 for current and capital expenditures.

In 1962, Mayor Grady named a five-member commission to study the possibility of modernizing the Planning Commission provisions in the City Charter. The Board of Estimates approved a review of the municipal pension system and also a study to be made by a private consulting firm to consider putting such services as sewer and trash disposal systems under a metropolitan authority.

The Maryland Court of Appeals ruled that religious exercises in Baltimore City do not violate the U.S. Constitution. The case involved a school board regulation calling for a daily opening exercise of Bible reading and recitation of the Lord's Prayer.

The Baltimore Beltway, a 32.8-mile highway that encircles the city, was opened to traffic in June. Completion of the last leg of the Jones Falls expressway was approved; this will provide for a high-speed highway from the central city to the Beltway and connecting expressways. The Baltimore Transit Authority announced that it would replace streetcars with buses by Jan. 1, 1964.

The Supreme Bench of Baltimore City chose William J. O'Donnell as state's attorney to fill out the term of the late Saul J. Harris. The City Democratic Committee had selected Francis J. Valle for this post, but was enjoined from submitting the name to the Elections Board.

Governor Tawes in November appointed Mayor J. Harold Grady as an associate judge of the Supreme Bench. He was to be succeeded as mayor by City Council President Philip H. Goodman.

Baltimore's new $14 million civic center opened in October. This is the first building to be completed in an ambitious downtown renewal project.

BANKING

The United States government, through the Federal Reserve System, maintained in 1962 a program of credit availability and interest rates favorable to domestic business expansion and to restraining short-term loanable funds from being shifted into foreign investments. Although business recovery began early in 1961, the continued expansion in 1962 fell short of full recovery, and induced no appreciable tightening of credit. In Canada, a similar domestic economic situation prevailed, but in mid-1962 credit was tightened primarily in response to a shift of loanable funds abroad and a generally adverse international payments position.

United States.—The Federal Reserve banks (12 regional banks controlled by the Board of Governors) encouraged an increase in the supply of available commercial bank credit, mainly by open-market purchases of medium- and long-term United States government securities. These operations and other conditions lowered net interest yields on such securities generally below the 1961 level. The open-market purchases also supplied reserves for commercial banks, enlarging their capacity for making loans and investments. This policy of credit ease was maintained during 1962, since inflationary price tendencies were almost nonexistent (see COST OF LIVING) and unemployment and unused plant capacity remained substantial.

Maintenance of credit ease for encouraging domestic business expansion, as in 1961, was complicated by the international short-term investment situation. Reserves of commercial banks were not supplied by open-market purchases so liberally as to encourage banks to seek more actively foreign investments for their funds. Such investments contributed to the persistent deficit in the United States international transactions, which resulted in recent years in substantial gold losses.

In particular, Federal Reserve action included open-market sales of short-term United States government securities—reinforced by increased United States Treasury offerings of three-month bills for financing the government's deficit—in order to prevent a rise in their prices from lowering net yields and short-term interest rates generally. This holding up of short-term rates to restrain shifts in short-term funds abroad also was facilitated by revision of the Federal Reserve's Regulation Q (effective Jan. 1, 1962) permitting higher interest rates (maximum of 4% instead of 3%) on time and saving deposits to be paid by member banks (that is, commercial banks owning the stock of Federal Reserve banks, controlled directly by the Reserve System, and accounting for more than 80% of commercial bank credit). During the year short-term interest rates fluctuated narrowly at levels slightly above those reached at the end of 1961; long-term rates tended to decline irregularly and appreciably.

The net position of the Reserve banks in their open-market operations changed appreciably during 1962. Their holdings of United States government securities increased about $800 million during the first half of the year. Holdings in the 1-to-5-year maturity range rose nearly $1.3 billion, while holdings of Treasury bills and other issues maturing within one year declined about $500 million. In the second half of 1962, total holdings increased about $1.2 billion, but the major part of the increase was in government issues maturing within one year. Partially as a result of these operations, member banks' reserves in the aggregate averaged about $500 million in excess of the required minimum, measured as a percentage of the member bank's deposit liabilities to customers. Borrowings of some member banks from the Reserve banks to meet temporary minimum reserve requirements were on the average in a very moderate range of $50 to $150 million, so that free reserves (that is, excess reserves minus "borrowings") were in a substantial range of $350 to $450 million—slightly below that of the free reserves of 1961.

A minor change was made in 1962 in the reserve requirements of the member banks in order to ease the credit situation. The reserve requirements for city and country banks remained at 16½ and 12%, respectively, of net demand deposits. However, the reserve requirement for time deposits of all member banks was reduced in October from 5 to 4% of such deposits.

Another important control over credit extension of the commercial banks, namely, the discount rate or interest rate charged by the Reserve banks on loans to member banks, remained at 3%. A minor control over the use of credit for certain transactions was relaxed following the sharp decline in stock prices in May–June 1962. The Board of Governors reduced from 70 to 50% (effective July 10) the required margin, or down

Architect's rendering of Charles Center, Baltimore's downtown renewal project, is superimposed on this photograph.

BALTIMORE ASSOCIATION OF COMMERCE

payment, to finance purchases of securities registered on a national securities exchange.

The combination of Federal Reserve actions and a moderate increase in demand for business loans, offset by an increased flow of savings, resulted in relative stability of interest rates in 1962—slightly higher short-term rates than in 1961 and some decline in long-term rates. The rates of leading commercial banks on prime loans (that is, short-term loans to the bank's biggest customers having the highest credit rating) remained at 4½%. The open-market yield on three-month Treasury bills averaged about 2.76%, compared with 2.36% in 1961.

Declines in Treasury and corporate bond yields from late February to mid-May 1962 offset earlier advances, and yields on state and local government bonds reached a four-year low of 3.21%. The latter decline was partly influenced by widespread advances in interest rates paid on commercial bank time and savings deposits. Many member banks early in January raised their rates above the previous maximum permissible rate of 3%, and a large proportion chose the new 4% ceiling rate on regular savings accounts.

Commercial bank credit (loans and investments of all commercial banks) increased substantially in 1962 under the credit-ease program of the Federal Reserve. The increase, on the basis of data seasonally adjusted and excluding interbank loans, was appreciable monthly, except for a July decline, and reached a level in September about $12.4 billion above the year-end total of 1961. Both loans and investments showed about an equal percentage increase. The July decline, however, was due entirely to a reduction in the commercial banks' investments in United States government securities.

Bank Loans.—Total loans of commercial banks increased moderately in 1962, after a slight decline in January, and in September were about $8.6 billion above the December 1961 total. Business loans, the largest component in commercial bank loans, declined slightly early in the year and then rose about $800 million above the December total. This slight increase reflected a moderate expansion in inventory investment and in plant and equipment outlays. Also, some growth in retained earnings and in depreciation allowances permitted substantial internal financing by corporations. Real estate loans, the next largest component, increased substantially and reached a level in September about $1.4 billion above the December 1961 total. In the same period, commercial bank loans to individuals, mostly for consumption purposes, increased approximately $1.1 billion. Loans for purchasing or carrying securities, especially to brokers and dealers, decreased appreciably in the first part of the year.

Bank Investments.—Total investments of commercial banks in 1962 showed appreciable monthly increases, except in July, and in September were about $3.8 billion above the December 1961 total. The July decline of about $1.7 billion resulted from a $2.5 billion decrease in investments in United States government securities and an $800 million increase in other securities. Practically all of the three-quarter increase in investments was accounted for by "other securities," consisting mainly of state and local government securities.

Deposits and Currency.—Demand deposits and currency outside banks (that is, held by businesses and individuals) decreased slightly, on a seasonally adjusted basis, in the first three quarters of 1962. Demand deposits comprising about 80% of this active money supply accounted for the entire decrease; currency increased slightly. However, turnover of demand deposits was appreciably higher than in 1961. With some idle demand deposit balances apparently transferred to time and savings deposits, and with the moderate expansion in business transactions, the existing supply of demand deposits was more intensively utilized.

ASSETS AND LIABILITIES OF ALL BANKS IN THE UNITED STATES[1]

(In millions of dollars)

Item	Sept. 13, 1961	Sept. 12, 1962
Assets		
Loans and investments:		
Loans	$148,190	$163,010
U.S. Government obligations	70,260	70,070
Other securities	28,820	34,070
Total loans and investments	$247,270	$267,150
Cash assets	47,910	50,520
Other assets	6,870	7,160
Total assets	$302,050	$324,830
Liabilities and Capital		
Deposits:		
Interbank	$ 15,220	$ 15,870
Demand:		
United States Government	3,480	5,430
Other	129,410	131,930
Time	118,460	133,700
Total deposits	$266,570	$286,930
Other liabilities	9,840	10,760
Total capital accounts	25,640	27,140
Total liabilities and capital	$302,050	$324,830

[1] Includes 13,430 commercial banks and 513 mutual savings banks as of Jan. 1, 1962. (Source: Board of Governors of the Federal Reserve System.)

Time and savings deposits showed a steady and very substantial increase in the first three quarters of approximately $13.8 billion. The bulk of the increase was accounted for by commercial banks—holders of approximately 70% of such deposits. Mutual savings banks' deposits increased moderately, about $2.1 billion in the first three quarters. The share of commercial banks in the holdings of these deposits was slightly greater than in 1961, largely because of the higher rates permitted by the Federal Reserve to be paid on time and savings deposits by member banks.

Insurance of Bank Deposits.—The Federal Deposit Insurance Corporation, which insures the deposits (up to a maximum of $10,000 for each depositor) of nearly all banks, was not called on in the first half of 1962 for financial aid to protect depositors in a bank failure and liquidation. At the end of June 1962, the corporation's assets totaled $2.6 billion; the liabilities, $0.181 million; and the insurance fund (excess of assets over liabilities), $2.4 billion—the last resulting largely from annual insurance premiums paid on total deposits by insured banks.

Canada.—The availability of credit was restrained and its cost substantially increased in Canada in mid-1962, largely because of an adverse international payments situation. Early in May the government established a fixed parity for the Canadian dollar at U.S.$0.925—an appreciable decline from the rate of U.S.$1.05 in 1960.

This currency depreciation came after a loss of $469 million in Canada's official exchange reserves during the first four months of 1962 to meet an outflow of capital, and payments for imports in excess of export receipts. The lower exchange rate was expected to encourage exports and to lessen imports.

Among other remedial government actions was the Bank of Canada's move on June 25 toward higher interest rates to attract an inflow of capital. This government-owned central bank reintroduced a fixed discount rate, at 6%, which was more than 2% above the variable rate prevailing in the first five months of the year. Since 1956 the discount rate had been automatically set at 0.25% above the weekly Treasury bill rate.

The yield on three-month Treasury bills offered weekly by the government increased from 3.07% in January 1962 to 5.51% in July, and then declined to 5.07% in September. The variable rate (bill rate plus 0.25%) was continued on the bank's loans to money market dealers. The fixed rate applied on the bank's temporary loans or advances to the commercial banks (that is, the seven chartered banks, with almost 4,000 branches). This rate was reduced from

6 to 5½% on September 7. Open-market sales of government securities, including new emphasis on long-term bonds, were made by the bank at crucial times in order to hold their prices low enough to maintain relatively high yields. The aim was to encourage purchases by foreign buyers.

Under this policy of credit restraint, commercial bank credit increased very little during the first three quarters of 1962. Total loans of the commercial banks increased about $1.2 billion, but their investments declined about $860 million—a net increase in credit of $340 million. Business loans, the largest component in total loans, increased about $700 million, reflecting continued mild expansion in the output of the economy. Personal loans, the next largest component, increased about $275 million.

In order to meet the increased demand for loans, and also maintain their cash and liquidity reserves, the banks began selling in June some of their investments—mainly Government of Canada securities. Holdings of Treasury bills were also reduced.

Commercial bank deposits (seasonally adjusted) held by the general public increased about $200 million in the first three quarters of 1962. Personal savings deposits increased about $300 million and other deposits, consisting mostly of demand deposits, decreased about $100 million. The money supply (that is, currency outside the commercial banks and total bank deposits) increased about $200 million.

The total Canadian dollar deposit liabilities of the commercial banks (including federal and provincial governments' deposits and foreign banks' deposits) increased about $300 million in the first three quarters of 1962. The commercial banks' ratio of cash reserves (deposits with the Bank of Canada, and Bank of Canada notes) to these total deposit liabilities was maintained with some difficulty fractionally above the required minimum of 8%. Also, their ratio of liquid assets (comprising cash reserves, day-to-day loans, and Treasury bills) to deposit liabilities declined from approximately 18% in the first quarter to 15.5% in the third quarter of the year. Since the agreed minimum liquidity ratio was 15%, a tight credit situation prevailed.

(For additional information, see the Index entry, *Banking*.)

Professor of Economics,
The Ohio State University.

BAPTIST CHURCHES

Baptist churches in 1961 had a membership of 21,396,250, with 91,840 individual churches making up the 28 autonomous Baptist congregations, as reported in the 1963 edition of the *Year Book of American Churches*. Baptists thus remain the largest single communion in the United States, representing about one third of all Protestants.

The Southern Baptist Convention (see below) is the largest of the Baptist bodies. Next is the National Baptist Convention, U.S.A., Inc., a Negro group, which reported an estimated 5 million members in 1958. Third, and also a Negro denomination, is the National Baptist Convention of America, whose membership in 1956 was 2,668,799; and fourth is the American Baptist Convention (see below). For membership figures of other large Baptist bodies, see the article CHURCH MEMBERSHIP, U.S.

AMERICAN BAPTIST CONVENTION

In 1962 the American Baptist Convention (known until 1950 as the Northern Baptist Convention) represented the cooperative interest of 6,283 churches in 42 states, and had a total membership of 1,544,505.

The church's missionary and benevolent work program is carried on in the United States, Africa, Asia, Europe, and several Latin American countries by 7 national societies and boards, 36 state conventions, and 14 city societies. It is supported by contributions from churches to a unified budget, representing the interests of all agencies. The approved budget for 1963 is $11.4 million. This amount, plus about $4.2 million from other income, provides over $15 million for the support of the missionary enterprises of the American Baptist Convention. An additional $8.2 million, to be paid over a 3-year period, beginning in 1960, has been pledged by American Baptists for strengthening the convention's work in Christian higher education, with funds to be allocated for colleges, universities, theological institutions, and scholarship programs. A new national office building and graphic arts plant, erected at Valley Forge, Pa., at a cost of $8.5 million, were occupied by the convention in late 1961.

In 1962, at Philadelphia, Dr. Benjamin P. Browne of Chicago was elected president of the convention for 1962–63. The convention is affiliated with the Baptist World Alliance, the National Council of the Churches of Christ in the U.S.A., and the World Council of Churches.

EDWIN H. TULLER,
General Secretary, American Baptist Convention.

SOUTHERN BAPTIST CONVENTION

The Southern Baptist Convention, largest of the Baptist bodies, reported 32,598 churches in 1961 with a membership of 9,978,488 in 28 states.

The 71 Southern Baptist educational institutions reported 77,143 students in 1961–62, with 5,502 in the six seminaries located at Louisville, Ky., New Orleans, La., Fort Worth, Texas, Mill Valley, Calif., Wake Forest, N.C., and Kansas City, Mo. There were 79 students in the American Baptist Theological Seminary for Negroes located in Nashville, Tenn. The educational institutions reported endowments of $90,638,263 and property valued at $268,157,552. The 44 Baptist hospitals reported property valued at $178,388,481. The 27 children's homes reported 6,340 children, and property valued at $32,642,239 in 1961. The denomination supports 1,548 foreign missionaries and 1,975 home missionaries. The Annuity Board reported 24,605 active members, with assets totaling more than $93 million.

The publishing division of the convention is the Baptist Sunday School Board, located in Nashville, Tenn. In 1961 it distributed 110,395,424 individual literature items and published 5,984,237 books.

Dr. Herschel H. Hobbs of Oklahoma City was elected president of the 1962 convention, held in San Francisco. The office of the Southern Baptist Convention Executive Committee is located at 127 Ninth Avenue, N., Nashville 3, Tenn.

BEEBE, (Charles) William

U.S. naturalist, author, and explorer: b. Brooklyn, N.Y., July 29, 1877; d. near Arima, Trinidad, June 4, 1962.

The leader of scientific expeditions that took him from the Himalayas to the depths of the Atlantic, Beebe was equally acclaimed for his research on birds, fishes, and mammals, and for

the literary talents he displayed in two dozen books recounting his experiences as a naturalist. In 1934 his record underwater descent off Bermuda made him a celebrity; the depth of 3,028 feet which he reached that year in a glass-windowed iron cylinder called the bathysphere was not exceeded until 1949, when Otis Barton, designer of the vessel, descended 4,500 feet. The present record of 35,800 feet was established in 1960 by Jacques Piccard and Lt. Don Walsh in the U.S. Navy's bathyscaphe *Trieste,* designed by Piccard's father, Auguste Piccard (q.v.).

After graduating from Columbia University (B.S., 1898), Beebe joined the New York Zoological Society in 1899 as curator of ornithology and director of scientific research. He organized the society's renowned collection of birds at the Bronx Zoo and founded (1916) its Department of Tropical Research. Although he retired as an executive of the society in 1952, he continued to direct its Trinidad research station, Simla, where he died.

Beebe's first book was *Two Bird Lovers in Mexico* (1905); his research in ornithology was climaxed by the exhaustive four-volume *Monographs of the Pheasants* (1918), for which he spent two years in the jungles of Asia and Malaysia gathering data. In the 1920's, after service as a combat aviator during World War I, he made two notable scientific expeditions: to the Galápagos Islands, off Ecuador, where he studied the sea iguanas (*Galápagos: World's End,* 1924); and to the North Atlantic in a wooden ship, *Arcturus,* to explore the marine life and floating seaweed formations of the Sargasso Sea (*The Arcturus Adventure,* 1926). In *Half Mile Down* (1934) he described his bathysphere descents, made on a New York Zoological Society oceanographic expedition. One of Beebe's most interesting books, *Unseen Life of New York* (1953), investigated the amazing variety of wildlife to be found in that city. Excerpts from his 50 years of writing on natural history were published in *Adventuring with Beebe* (1955).

BELGIUM

This constitutional monarchy on the northwest coast of Europe has an area of 11,775 square miles and a population of 9,373,370 (est. March 31, 1962). The population is divided into two distinct ethnic groups—the Flemish (Dutch)-speaking Flemings and the French-speaking Walloons. French and Flemish are the official languages. Principal cities and populations (est. Dec. 31, 1961, with suburbs): Brussels, the capital, 1,398,326; Antwerp, 849,432; Liège, 607,117; Charleroi, 469,259; Ghent, 455,022.

Government.—King Baudouin (b. 1930; acceded 1951) is the hereditary constitutional monarch. The bicameral Parliament, elected every four years or after dissolution by the sovereign, consists of a Senate with 175 members and a Chamber of Representatives with 212 members. Of the senators, 106 are elected directly, 46 by provincial councilors, and 23 by their fellow senators. The representatives, one for every 40,000 inhabitants, are elected by proportional representation. Suffrage has been universal since 1950. Following the elections of March 26, 1961, party strength in the Chamber of Representatives was as follows: Christian Socialists (Catholic), 96; Socialists, 84; Liberals, 20; Communists, 5; Flemish Unionists, 5. Premier Theo Lefevre heads a Christian-Social-Socialist coalition cabinet, sworn in on April 25, 1961.

Belgium, which is joined with Luxembourg in an economic union, is a member of the Benelux Economic Union, the European Economic Community, and the European Atomic Energy Community.

Education and Religion.—Number of schools (with enrollments), 1959–60: 4,475 infant (392,345); 9,048 primary (960,282); 1,229 secondary (21,959); and four major universities (26,497 students in 1960–61). Outside of Brussels, Roman Catholic Flemings represent 50% of the population, and Protestant Walloons, 33.61%.

Finance.—Government revenue, 1962 est.: 132.4 billion francs (120.8 billion in 1961); expenditure, 147.2 billion (129.1 billion). The Belgian franc equals U.S.$0.02. National debt: 444 billion francs as of May 31, 1962 (up 126.9 billion from Jan. 1, 1960). Gold and foreign exchange holdings of the National Bank: $1,625 million as of Aug. 31, 1962 (down $32 million from Dec. 31, 1961).

Transportation and Communications.—Transport networks (miles, 1961): state-owned railways, 2,895 miles (20% electrified); main roads, 6,330; navigable waterways, 990. Merchant marine tonnage (Jan. 1, 1961): 676,791 gross registered tons. National airline: Sabena (serves 30 countries; 1,264,094,000 passenger-kilometers in 1960). Other data for 1960: registered motor vehicles, 1,004,800; telephone subscribers, 1,085,594; radio receivers, 2,612,850 (1961); television sets, 820,709 (1961); 47 daily newspapers (1959).

Economic Indicators.—Gross national product: 608 billion francs in 1960 (up 6% from 1959). Index of industrial production (1953 = 100): 139.0 (provisional) in 1961 (131.6 in 1960). Cost-of-living index (1958 = 100): 104 in August 1962 (103 in September 1961). Index of employment (1958 = 100): 101 for final quarter of 1961 (99 for final quarter of 1960).

Manufactures and Minerals.—Chief industrial products (metric tons, 1961): coal, 21.5 million (down 4.4%); steel, 6.9 million (down 4%); cement, 4,752,000 (up 8.2%); glass, 308,000 (down 15.5%); electric power, 16.02 billion kw.-hr. (up 5.0%). Construction permits in 1961 increased by 11% over 1960. Textiles production rose by 3% in the first 10 months of 1961.

Agriculture.—Agriculture engages 10% of the labor force. Chief crops (metric tons, 1961): wheat, 722,200 (down 6.6%); oats, 444,400 (down 1.2%); barley, 408,700 (up 6.9%); rye, 119,400 (down 36.3%); sugar beets, 2,328,112 (down 24%); potatoes, 1,593,242 (down 15.9%). The number of hogs and cattle increased slightly in 1961. The exceedingly wet summer in 1960 reduced the quantity of winter grains produced.

Foreign Trade.—Total exports, 1961: 195.3 billion francs (up 3.44% from 1960); imports, 209.2 billion (up 5.7%). Principal exports (in billion francs, for first 10 months of 1961): base metals, 54.4; textiles, 25.2; machinery and equipment, 15; chemicals, 12; precious stones, 8. Principal imports (in billion francs, for first 10 months of 1961): mineral products, 28.2; textile products, 21.4; machinery and industrial equipment, 21.6; base metals, 21.3; transport equipment, 16.7. Chief customers (with percentage of total Belgian-Luxembourg exports received in 1961): Netherlands (23.4%); West Germany (15.4%); France (11.2%). Principal suppliers (with percentage of total imports provided in 1961): West Germany (17.8%); Netherlands (15.3%); France (14.7%).

Events, 1962.—The year 1962 was another year of increased economic growth. Industrial activity was continued at high levels, and in the first half of 1962 registered a gain of 17% over the comparable period of 1961. There was again a marked increase in total wages earned due to the increase in the number of employed persons. Foreign investment was continued at a high rate, and prices were relatively stable. As in the previous year, expenditures for necessities declined, while expenditures for travel, luxury goods, and entertainment increased. As highly industrialized Belgium exports about half of its production and imports nearly all raw materials and one third of its food, its competitive economic position improved because of a relatively lower increase in production costs in 1961–62.

The position of the coal industry was improved. The closing of uneconomic coal mines proceeded; pithead stocks were reduced by 33% in 1961; the number of workers declined from 102,000 to 88,000; and worker productivity increased substantially. Since 1960 the European Coal and Steel Community has protected the market for Belgian coal, and this aid was continued through 1962. Early in the year the High Authority of the Community raised objections to Belgian plans for increased assistance to the coal industry, alleging that such aid would be in violation of the Community's original treaty. Belgium then abandoned plans to increase subsidies by means of taxes on steel and on imports of coal, but continued to dis-

cuss other proposals with the High Authority. In the spring of 1962 the High Authority authorized construction at Selzaete of a new steel works capable of producing 1.5 million tons annually.

The construction, petroleum, and metal manufacturing sectors of the economy have increased in economic importance and have offset the decline of the coal industry. Foreign investors have been attracted by the various incentives offered by the government. As a result, new foreign investments have increased in number and value.

It was feared that independence for the Congo (Léopoldville) and the chaos that followed in 1960–61 would seriously affect the economic life of Belgium. There was a sizable decline in trade with the Congo, but these losses were offset by new markets. Diplomatic relations with the Congo were resumed in December 1961, and indications pointed to an increase in trade for 1962. The Congolese sought Belgian technical assistance, often preferring it to United Nations technical assistance. Belgians began to return to the Congo; some 15,000 were reported to be in Léopoldville in June 1962.

Ruanda-Urundi, the United Nations trust territory administered by Belgium, became independent on July 1, 1962, as the separate states of Burundi and Rwanda (qq.v.).

Existing tensions between the Flemings and Walloons again broke into open clashes in 1962. The 1932 law requiring exclusive use of the predominant language in each community has given rise to much agitation in Flemish Louvain, where the university student body is divided rather evenly between Flemings and Walloons. Walloons staged demonstrations to protest against making the university exclusively Flemish.

In July a clash between Flemings and Walloons occurred in Antwerp. In October the Senate approved a bill fixing a boundary between the two cultural areas. On the succeeding Sunday, October 14, thousands of Flemings marched into Brussels to protest against domination by the Walloons. The Walloons staged counterdemonstrations, and 19 persons were injured in the disorders. Extremists of both groups agitated for a federal Belgium made up of Flanders, Wallonia, and a bilingual state of Brussels.

AMRY VANDENBOSCH,
Department of Political Science, University of Kentucky.

BEMELMANS, Ludwig

Austrian–U.S. painter and writer: b. Meran, Austria (now Merano, Italy), April 27, 1898; d. New York, N.Y., Oct. 1, 1962.

In children's rhymes or in satirical novels, in magazine illustrations or in barroom murals, Bemelmans always was immediately and absolutely identifiable as Bemelmans. Neither his painting nor his writing found a place in the mainstream of the art of his day, but their quality was generally acclaimed by critics, and their freshness and tang were a delight to millions.

The son of a Belgian painter, Bemelmans was raised in the Austrian Tirol by his maternal grandfather, an affluent brewer, and was educated at high schools in Bavaria. To quash his early inclinations toward painting, he was sent to work for an uncle who owned hotels in Switzerland. An ungovernable boy, he was removed from one hotel to another until 1914, when he shot a tyrannical headwaiter and, in retribution, was given a choice of going to reform school or to the United States.

In New York City, he worked as a busboy and waiter at several fashionable hotels until 1918, when he became a citizen and joined the U.S. Army. His experiences as a soldier provided the basis for his first adult book, *My War With the United States* (1937). After World War I, he returned to his job as a waiter at the Ritz Hotel, the prototype of the Hotel Splendide in his writings. He created an unsuccessful comic strip, "Count Bric-a-Brac," for the New York *World*, designed theatrical scenery, and in 1933 became manager of a new restaurant, Hapsburg House, which he decorated with his own sketches.

In 1934, with *Hansi*, Bemelmans became an author-illustrator of children's books. The little Parisian schoolgirl, Madeline (named after his wife), who first appeared in 1939 in a book with that title, was his most popular creation. He liked to think of himself primarily as a painter, but his ebullient good humor was more widely appreciated in his 30-odd books, which include *Now I Lay Me Down to Sleep* (1943), his first novel, adapted for Broadway in 1950; *Dirty Eddie* (1947), a best-selling satire on Hollywood; and *On Board Noah's Ark* (1962), a travel book. His short stories, informal essays, and illustrations also appeared in magazines. At the time of his death, he was working on the sixth book of the Madeline series and on a musical adaptation of his novel *The Street Where the Heart Lies* (published posthumously).

BEN BELLA, Ahmed (formerly **Mohammed**)

Premier of the Republic of Algeria: b. Marnia, Algeria, 1919.

One of the heroes of the Algerian struggle against the French, Ben Bella in 1962 made the transition from a French prison to the premiership of the new nation—after a fierce power struggle which almost erupted in civil war.

UPI

Ahmed Ben Bella, shown addressing the United Nations on October 9, emerged as premier of the newly independent Republic of Algeria in September 1962 after a bitter power struggle.

Ben Bella attended high school in Marnia, and became a soccer player of renown. He served in a Moroccan regiment of the French Army in World War II and was four times decorated for bravery. Returning to Marnia after the war, he soon became one of the early leaders of the clandestine Algerian war for independence. Imprisoned by the French in 1949, he escaped in 1952 and helped organize the group which later became the National Liberation Front (FLN). He fought against the French after the beginning of the open revolt in 1954. Arrested again in 1956, he was released after the cease-fire agreement at Évian-les-Bains in March 1962. His stature had grown during imprisonment, and he returned to Algeria a national hero.

Joining (as vice premier) the Provisional Government headed by Benyoussef Ben Khedda, Ben Bella on July 22, 1962, announced the formation of a seven-member Political Bureau to lead the government; on August 7 the bureau assumed political power. Following the September 20 elections, in which the candidates were picked by the

bureau, the new National Assembly elected Ben Bella premier on September 26.

Ben Bella visited the United States October 6–15, addressing the United Nations on October 8, the day of Algeria's admission to the world organization. He was officially received by President Kennedy on October 15, and on the following day he flew to Cuba for a one-day state visit, after which he issued a statement supporting Cuba's demands that the United States evacuate its naval base at Guantanamo Bay. On November 20 he stressed his desire for "healthy cooperation" with France (whose subsidy of Algeria was originally due to end on Jan. 1, 1963), and on December 4 he made an appeal for economic help from abroad to help Algeria overcome its "unbelievable problems."

BERLIN. See GERMANY and the Index entry, *Berlin.*

BERMUDA

A British crown colony in the Atlantic Ocean about 760 miles southeast of New York City, this group of 300 islands (20 of which are inhabited) has a land area of 20.59 square miles and a population (1960 census) of 42,640, about 63% of which is colored. The capital is Hamilton (1960 est. pop., 2,800), on Main Island; other important islands are St. George's, St. David's, Somerset, and Ireland.

Government.—The governor (Maj. Gen. Sir Julian Alvery Gascoigne) is assisted by an Executive Council of 8 members and a Legislative Council of 11 members, all appointed by the crown. The 36-member House of Assembly, elected by universal suffrage subject to certain property qualifications, is the oldest British colonial legislature.

Education.—Primary education is free and compulsory. Number of schools (with enrollment), 1961: 71 (11,000), including 47 primary schools (8,724). Vocational and technical students numbered 333.

Finance.—Government revenue, 1961: £5,148,022; expenditure: £5,115,759 (trade development, £646,430; education, £604,186; public works, £493,121).

Transportation and Communications.—Four airlines supply service directly to and from New York: British Overseas Airways Corporation, Cunard Eagle Airways, Eastern Airlines, and Pan American World Airways. Other routes connect the colony with Canada, the West Indies, South America, and Europe. A large airfield forms part of an airbase leased with a naval base to the United States for 99 years in 1940. Twelve shipping lines serve Bermuda from North America and Europe. No passports are required of United States citizens. Radio receivers numbered 18,000 in 1959; television sets, 8,500 in 1960.

Economy.—Tourism is vital to the economy. The number of visitors, most of them from the United States, increased from 148,156 in 1960 to 169,957 in 1961 (by air, 113,280; by ship, 56,677, including 46,306 cruise passengers). The cultivated area (579 acres) produces bananas, citrus fruits, lilies and other plants, and vegetables.

Foreign Trade.—Exports, 1961: £9,534,387 (drugs and essences, £3,408,743; re-exports of bunkers and ship stores, £2,482,986). Imports: £21,955,457 (£10,471,460 from the United States), including gasoline (£1,704,658), electrical supplies (£1,274,468), cotton clothing (£830,502), and hardware (£496,671).

Events, 1962.—The newly completed United States government satellite-tracking station on Cooper's Island played an important part in the successful launching of America's first manned orbital flights in February and May.

In January a new transoceanic coaxial cable from Flatts, Bermuda, to Manahawkin, N.J., went into operation, starting on a manual basis. Local operators, by means of key sets, now place calls through the cable into the United States and Canadian automatic networks with no intervening operator.

BHUTAN

Located high in the Himalayas between China and India, Bhutan is an autonomous state with an estimated area of 19,305 square miles, and a population (1961 est.) of 680,000. Bhutan is closely allied to Tibet by language (Tibetan), race (Bhotia), and religion (Buddhism). Thimbu, the designated capital, was under construction in 1962. The chief seat of government, which moves with the ruler, is usually Tashi Chho Dzong in Thimbu district in the summer and Punakha in the winter; Paro also serves as a temporary capital.

Bhutan is ruled by an absolute monarch (Maharaja Jigme Dorji Wangchuk (b. 1929; installed, Oct. 27, 1952), who is advised by a 130-member National Assembly (Tsongdu). The maharaja is assisted by feudal governors (penlops) of the state's eight provinces.

Subsistence agriculture is the main occupation; chief crops are rice, wheat, and buckwheat. Stock raising is important in the highlands. The northern forests provide valuable hardwoods for export. Some iron, dolomite, and coal are mined. Practically all of Bhutan's trade is with India.

India provides an annual subsidy of 500,000 rupees (about $105,000) to Bhutan under the treaty of Aug. 8, 1949. India conducts Bhutan's foreign relations, and has extended a guarantee of military defense of the state in case of aggression. On July 27, 1961, India announced a five-year plan aimed at increasing Bhutan's internal revenues and creating a self-sufficient economy. In May 1962 a 110-mile road from Paro to a border town in West Bengal was opened.

Bhutan's dispute with Communist China over the latter's claim to 300 miles of territory in northeastern Bhutan remained unresolved during 1962, but Bhutan was not invaded during the large-scale fighting late in the year between China and India.

As a step forward in its modernization program, Bhutan announced in March 1962 that it was establishing its own postal service and would apply for membership in the Universal Postal Union.

BIOCHEMISTRY

Perhaps the most dramatic and significant biochemical developments of 1962 concerned the coding principle by which the genetic information contained in the cell nucleus is transferred to the protein-synthesizing system in the ribosome; and the cell-free growth in the laboratory of biologically active nucleic acid of the tobacco mosaic virus.

Messenger Ribonucleic Acid.—Enzymes in the cell nucleus are capable of causing synthesis of ribonucleic acid (RNA) from the nucleoside 5′-triphosphates as precursors; the formation of this type of RNA requires deoxyribonucleic acid (DNA) as a primer or template. Since the newly synthesized RNA has a purine and pyrimidine base composition apparently identical with that of the primer DNA, it is considered to be a replica or copy of the DNA.

Sol Spiegelman and others have been able to isolate a DNA-RNA complex, presumably a double-stranded helical structure, which is probably an intermediate stage in this copying process. This type of RNA is apparently identical with the so-called messenger RNA postulated by Jacques Monod and François Jacob. This is sent to the ribosome with the genetic message to be used as a template in enzymatic formation of protein. It has

long been the expectation that the sequence of the four different bases of nucleic acids determines or codes the sequence of the 20 different amino acids in the protein undergoing synthesis.

Triplet Nucleotide Sequence.—Despite much past speculation on the nature of this code, there has been little understanding of its details until this past year. Several years ago, Seymour Benzer had shown that probably only a very few nucleotide units in the DNA chain are required to code a single specific amino acid. However, in 1961 a group led by F. H. C. Crick at Cambridge University produced genetic evidence that a sequence of three nucleotide units, a triplet, codes a single amino acid in a "comma-less" code.

This idea has been given direct biochemical support by simultaneous work by Marshall W. Nirenberg and his colleagues at the National Institutes of Health and by Severo Ochoa and his co-workers at New York University. Nirenberg found that incorporation of certain radioactive amino acids into ribosomes of *Escherichia coli* may be greatly stimulated by either naturally occurring RNA or by synthetic polynucleotides having only one type of mononucleotide unit, such as polyuridylic acid. Presumably such ribosomes are deficient in template RNA; the RNA or polynucleotides added in such experiments apparently act as messengers and form a template on the ribosome. Nirenberg and his colleagues found that when added to *E. coli* ribosomes, the synthetic polyuridylic acid (containing only the base uracil) caused stimulation of incorporation of only one specific amino acid, phenylalanine, into peptide linkage in the ribosome. They concluded that uridylic acid (abbreviated U) codes only for the amino acid phenylalanine (abbreviated Phe).

Amino Acid Code.—This finding immediately suggested that if a large variety of synthetic polynucleotides of known base composition and sequence could be tested as messengers or determinants for the incorporation of one specific amino acid or another, then the basis of the genetic code for amino acids could be worked out. By this approach the groups led by Ochoa and Nirenberg were able to show in a few months' time that each of the 20 specific amino acids was apparently coded by a triplet of specific nucleotide units in the messenger polynucleotide, each of which has a known characteristic content and sequence of bases. The accompanying table shows the coding triplets which have been assigned.

NUCLEOTIDE TRIPLETS OF MESSENGER RNA WHICH CODE THE AMINO ACIDS

Amino acid	Symbol	Bases in triplet
Alanine	Ala	U C G
Arginine	Arg	U C G
Asparagine	AspN	U A C; U A A
Aspartate	Asp	U A G
Cysteine	Cys	U U G
Glutamate	Glu	U A G
Glutamine	GluN	U C G
Glycine	Gly	U G G
Histidine	His	U A C
Isoleucine	Ileu	U U A
Leucine	Leu	U U C; U U A; U U G
Lysine	Lys	U A A
Methionine	Met	U A G
Phenylalanine	Phe	U U U
Proline	Pro	U C C
Serine	Ser	U U C
Threonine	Thr	U A C; U C C
Tryptophan	Try	U G G
Tyrosine	Tyr	U U A
Valine	Val	U U G

Each amino acid can be coded by a trinucleotide containing three specific bases as shown in the table. Presumably these must be in specific sequences, not yet determined experimentally, explaining why some appear for more than one amino acid. Starting from the four known bases—adenine (A), uracil (U), cytosine (C), and guanine (G)—there are 64 possible triplets of specific sequence, whereas only 20 would be needed to code the 20 amino acids.

This fact suggests that the genetic code may be degenerate—that is, that more than one triplet codes a specific amino acid. Actually this has been found to be the case in a few instances, as shown in the table. It is also very curious that uracil is present in all the triplets, whereas this base does not occur in natural RNA specimens in the proportions required by these findings. It is probable that the experimental methods used by Ochoa and Nirenberg have tended to select the U-containing triplets from a degenerate coding system. On the other hand, Roberts has suggested that the code may actually involve doublets rather than triplets of nucleotides, if the common character uracil is eliminated.

These discoveries, which require much further analysis, have dramatically opened the whole problem of the genetic coding system to rather simple and direct experimental analysis, with implications as important to biology and medicine as atomic fission and fusion have had in the realm of the physical sciences. (See also BACTERIOLOGY; GENETICS.)

Cell-Free Growth of Virus.—Scientists at the University of California, Los Angeles, and at Utah State University have independently reported on a technique for growing infectious tobacco mosaic virus outside of the living cell. Normally, viruses grow only within living cells. The nucleic-acid cores of the virus enter the host cells and there monopolize the normal enzymatic mechanisms for making nucleic acids, with the result that new virus nucleic acid is turned out. Such infectious viruses as those of polio and hepatitis are grown in tissue cultures in this way.

The announced new technique consists of obtaining a filtered sap from leaves infected by the tobacco mosaic virus, containing large, virus-synthesizing enzyme molecules and possibly cell nuclei. The addition of four chemicals—the triphosphates of adenosine, guanosine, cytidine, and uridine—to the cell-free sap then produces the rapid formation of the virus nucleic acid, constituting the heart of the tobacco virus. Radioactive adenosine triphosphate (ATP) was used to check the technique and to produce, from tagged nucleic acid, further batches of the virus nucleic acid in the sap. If further research confirms these experiments, it will be the first time a biologically active nucleic acid has been formed independently of the intact cell. This discovery could lead to simple methods for growing and studying virus nucleic acid or even viruses in a cell-free medium.

ALBERT L. LEHNINGER,
Professor and Director, Department of Physiological Chemistry, School of Medicine, Johns Hopkins University.

An international team of scientists at the University of Utah, led by Dr. George W. Cochran of the United States (third from left), in 1962 reported on a method of growing infectious tobacco mosaic virus outside the living cell.

BOATING

The eyes of the nonboating as well as boating worlds focused in September 1962 on Newport, R.I., where the America's Cup, sailing's oldest international trophy, was in contention for the 18th time. "The Old Mug," as it is also called, was successfully defended by the United States 12-meter yacht *Weatherly*, which won four of the five races against the challenging Australian 12-meter yacht *Gretel.* Although she failed to make off with the famous trophy (an American possession since 1851), the Australian yacht distinguished herself by becoming the third challenger to win a race in an America's Cup series.

Less than a month after the deciding race of 1962, the New York Yacht Club accepted a challenge from the Royal Thames Yacht Club of London, England, and scheduled the next cup match for September 1964.

The sailing segment of the pleasure boat fleet continued to exhibit impressive growth in 1962, the bulk of the newcomers again being one-design craft (class boats) of from 13½ to 20 feet in length. Confirming the soaring popularity of sailing craft in general, the nation's largest and one of its oldest builders of stock powerboats, the Chris-Craft Corporation, introduced its first sailboat—a 35-foot auxiliary sloop with cruising accommodations for six persons.

The array of production houseboat models doubled (there were more than 100 models from which to choose in 1962), and the number of firms engaged in their manufacture passed the two-dozen mark. Public interest in houseboats was high, and the houseboat fleet appeared likely to expand greatly.

Deep-V powerboat hulls with longitudinally stepped bottoms showed up in an increasing number of small boat lines, revealing the trend-setting impact of the "Moppie" hull form introduced in 1960. Its reputation for speed and rough water stability assured its application in larger pleasure craft in 1963.

Evident in popular-sized cabin cruisers that rolled off production lines in 1962 were the distinct emphasis placed on quality and optimum utilization of space, as well as comfort and styling. With few exceptions, builders offered a better product for the price, and obviously had gone to great lengths in planning interior accommodations and other built-in conveniences.

Inboard-outboard power packages combining the operating economy of inboard engines with the compactness, ease of installation, and easier steering of outboard motors claimed a permanent place in the marine propulsion market. Several major engine manufacturers, including the two largest outboard motor producers, featured outdrives in their 1962 lines. Builders of stock boats adopted them on a large scale.

The number of boats registered under the Federal Boating Act of 1958 showed an increase over the total recorded in 1961, and the boating industry reported sales gains that, although slight, indicated that the slump experienced in recent years had run its course.

(For the results of boat competitions, see the *Motorboating* and *Yachting* sections of the article SPORTS, GAMES, AND SHOWS.)

BOHR, Niels Henrik David

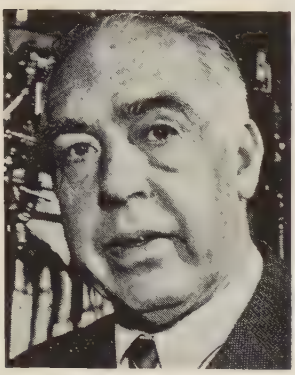
Danish physicist: b. Copenhagen, Denmark, Oct. 7, 1885; d. Copenhagen, Nov. 18, 1962.

A creative nuclear physicist, whose thinking helped to clarify the structure and behavior of the atom and to release atomic energy for human use, Niels Bohr won both the Nobel Prize in physics and the Atoms for Peace Award. He made Copenhagen a world center for the development of the next generation of physicists, and in his later years devoted his energies to stimulating the peaceful applications of atomic fission.

The son of a professor of physiology, Bohr was educated at the University of Copenhagen, where he distinguished himself both as a physics student and as a soccer player known throughout Scandinavia. After receiving his doctorate in physics from the university in 1911, Bohr went to England and worked at the Cavendish Laboratory of Cambridge University and subsequently at the University of Manchester, where he was associated with the nuclear physicist Ernest Rutherford. In 1916, Bohr became professor of theoretical physics at the University of Copenhagen, and in 1920, director of the university's newly created Institute for Theoretical Physics.

Working from the Rutherford construct of the atom, Max Planck's theory of heat radiation, and Albert Einstein's study of the photoelectric emission of electrons, Bohr by 1913 had developed the model of the atom in which the negatively charged electrons move around the positively charged nucleus in restricted orbits. His explanation that the atom emits definite quanta or bits of energy as electrons shift inward from outer orbits (or shells), and absorbs quanta as electrons move outward, formed the basis for the quantum theory and provided the theoretical foundation for spectroscopy by explaining spectral emission. For these achievements Bohr was awarded the Nobel Prize in physics in 1922.

While at the Institute for Advanced Study at Princeton, N.J., in 1939, Bohr went beyond the work of the German chemists Otto Hahn and Fritz Strassmann on the splitting of the uranium nucleus by neutrons. In collaboration with Dr. John A. Wheeler, Bohr formulated the theory of nuclear fission which led him directly to the identification of the lighter and scarcer isotope of uranium, U-235, as the prime source for atomic energy and stimulated the development of advanced atomic research.



Niels Bohr
(1885–1962)

WIDE WORLD

Bohr returned to Denmark in 1940, then fled from the Nazis to Sweden with his family in 1943. Shortly afterward he went to England, and then to the United States again, where until 1945 he served as an adviser on atomic fission, mostly at the Los Alamos, N. Mex., atomic laboratory. He then resumed the directorship of the Institute for Theoretical Physics in Copenhagen, became chairman of the Danish Atomic Energy Commission, and worked tirelessly for international control of atomic energy. He was primarily responsible for arranging the first Atoms for Peace Conference in Geneva in 1955, and helped create the European Center for Nuclear Research (CERN). In 1957 he became the first recipient of the Ford Foundation's Atoms for Peace Award.

BOLIVIA

This landlocked South American republic has an area of 424,163 square miles. About one third of Bolivia is mountainous, with heights reaching over 21,000 feet; the remainder comprises tropical and subtropical lowlands. Bolivia's population (est. 1962) is 3,556,000. Sucre is the constitutional capital (1962 est. pop., 57,500), but La Paz (450,000) is the actual seat of government. Other major cities are Cochabamba (114,000), Oruro (88,000), Potosi (64,000), Santa Cruz (80,000), Tarija (23,500), and Trinidad (14,700). About 63% of Bolivians follow an Indian way of life. Spanish is the official language; Quechua, Aymará, and Guaraní are spoken widely.

Government.—Bolivia is a republic with a centralized government. The 13th Constitution went into effect in 1961. Executive power is vested in a president elected by popular vote to a 4-year term; President Victor Paz Estenssoro took office on Aug. 6, 1960. Congress consists of two houses, with 27 senators and 76 deputies elected for 6 and 4 years, respectively. The Bolivian Supreme Court of 10 justices is appointed for 6-year terms, and resides in Sucre. The country is divided into 9 departments governed by prefects appointed by the president. They are Chuquisaca (1961 est. pop., 307,600), La Paz (1,157,400), Cochabamba (550,300), Oruro (265,400), Potosí (619,600), Tarija (142,600), Santa Cruz (326,900), Beni (161,800), Pando (24,400). The departments are divided into 95 provinces, which are subdivided into cantons and independent municipalities.

Education and Religion.—Education is free and compulsory for all children aged 7 to 14 years. In 1961 some 64% of all persons aged 15 and over were illiterate (69% in 1951), and only 38% of the school-age population attended school (32% in 1951). Schools are administered by 3 different units: Ministry of Education, Ministry of Rural Affairs, and Department of Literacy. In 1962 the first unit handled 336,000 students; Rural Affairs had 205,550 students; and there were 40,386 students taking literacy courses, mostly at night. The 7 universities enroll over 15,000 students (many part-time), and administer literacy and night courses. Roman Catholicism is the state religion, but freedom of worship is a constitutional right which is strictly honored.

Finance.—The 1962 budget was estimated at 464 billion bolivianos (Bs.), compared with Bs.430 billion in 1961 (Bs.11,880 equal U.S.$1). Government revenues, 1962 est.: Bs.200.6 billion from custom duties, Bs.161.8 billion from taxes, Bs.80.0 billion from United States budgetary support, and Bs.21.6 billion from other sources. Main expenditures: Bs.66.0 billion for education, Bs.32.1 billion for rural affairs and rural education, Bs.60.0 billion for defense, Bs.17.3 billion for welfare, and Bs.12.0 billion for public works. There is controversy and contradictory claims about Bolivia's debt; claims for external debt range from $148.8 million to $239.6 million. Internal debt is estimated at Bs.680 billion. In 1961 interest and amortization of the public debt was Bs.25.3 billion. A new monetary unit, the Bolivian peso (equivalent to 1,000 bolivianos), is scheduled to be introduced in 1963 and to replace the boliviano by 1965.

Transportation and Communications.—Transport networks (miles, 1962): railways, 2,031; all-weather roads and trails, 11,594; passable roads and trails in dry season, 6,906; year-round navigable waterways, 8,894. Five foreign airlines serve Bolivia. The national airline, Lloyd Aéreo Boliviano, in 1961 carried 226,284 passengers and 56,365 tons of freight. Bolivia has 11,600 passenger cars, 24,000 commercial vehicles, 19,900 telephones, 200,000 radio receivers, and 40 radio stations.

Economic Development.—Fixed capital: $1,014.1 million in 1961 ($946.9 million in 1959). Cost-of-living index (1957 = 100): 132.4 in January 1962 (122 in January 1961). There were no wage increases in 1961 or 1962, although there were many strikes. United States aid continued to be of crucial importance: in 1962, United States technical assistance totaled $1.4 million; economic assistance, $28.1 million; and development loans under the Alliance for Progress program, $9.6 million. Additional foreign assistance from the United Nations and West Germany and other countries was estimated at $6.0 million over a two-year period. Alliance for Progress funds have been earmarked for 14 projects covering education, industry, irrigation, mining, transportation, agriculture, health, geological research, and manual arts.

Agriculture.—About 2.6 million Bolivians are engaged in agriculture, but Bolivia still imports 36.6% of its food. Under the agrarian reform law, 92,617 families received land from 1955 to April 1, 1962. The major agricultural products (in thousands of metric tons) are as follows:

Product	1959	1960	1961
Rice	22.6	22.9	23.0
Sugarcane	885.5	1,032.0	...
Refined sugar	17.5	24.4	41.2
Potatoes	775.5	575.0	620.0
Corn	293.0	298.0	305.0
Wheat	74.0	64.0	77.5
Meat	97.5	106.2	112.0

Mining and Manufacturing.—About 75% of Bolivia's total income is provided by the mining and manufacturing industries. Production for export of major minerals was as follows:

Mineral	1960 (in metric tons)	1961 (in metric tons)	1960 (in million dollars)	1961 (in million dollars)
Tin	19,718	20,735	$42.8	$50.3
Lead	21,419	20,301	4.8	4.1
Antimony	5,326	6,739	1.4	2.2
Copper	2,271	2,081	1.5	1.3
Tungsten	1,290	1,684	1.5	2.3
Silver	152	121	4.5	3.5
Sulfur	1,194	4,975	0.05	0.2

Petroleum production in 1961 (in cubic meters): raw oil, 430,257 (down 13.1% from 1960); refined gasoline, 146,269 (up 1.4%); other refined products, 200,103 (up 0.5%).

Manufacturing in 1960 supplied the following percentage of total needs: processed food, 35%; textiles, 70%; pharmaceuticals, 19%; leather, 80%; furniture, 80%; cement and glass, 87%; rubber, 10%; metal products, 3%; paper, 40%; construction materials, 78%.

Foreign Trade.—Total exports, 1961: $73.4 million; imports, $77.5 million. Principal exports (in million dollars): tin, 50.3; other minerals, 18.2; petroleum, 2.1; brazil nuts, 1.5. Principal imports (in million dollars): machinery, 7.5; motor vehicles, 4.5; raw materials, 5.9; pipe and tubing, 2.5; drugs, 2.7; food and beverages, 13.9. Exports in order of importance were to Great Britain, the United States, Argentina, Brazil, Japan, and West Germany; imports came mainly from the United States, West Germany, and Argentina.

Events, 1962.—The year was relatively quiet compared with past years during which Bolivia

was governed by the Movement of the National Revolution (MNR), which celebrated its tenth anniversary in power on April 9. There was active political campaigning for the congressional elections of June 3. The chief opposition was the rightist Bolivian Falange (FSB) and the Party of the Authentic Revolution (PRA), led by Walter Guevara Arze, who a few years ago had seceded from the MNR and formed the Authentic MNR (now called PRA). Guevara Arze returned from exile in 1962 but found his new party already split.

A total of 1,066,480 votes were cast for half of the 76 seats in the Chamber of Deputies and for one third of the 27 seats in the Senate, compared with 987,730 ballots cast in the 1960 presidential election. The MNR received 886,572 votes; the FSB, 74,178; the PRA, 44,296; and the Communist Party, 20,352.

There was much violence connected with personal rivalries of local officials in Santa Cruz. The Communists and pro-Castro elements showed strength in various labor unions and provoked many incidents. The ex-MNR vice president and recent cabinet member, Ñuflo Chávez Ortiz, emerged as the most articulate anti-United States spokesman and the leader of the pro-Castro elements. The main labor unions of Bolivia, through the powerful Third National Workers' Congress of May, condemned the Alliance for Progress as another tool of American imperialism.

Bolivia elaborated a ten-year development program which was submitted to Washington as a part of the Alliance for Progress. It was also submitted to the Organization of American States and the UN Economic Commission for Latin America. The ten-year project aims to raise drastically the standard of living of Bolivians and to change the shaky Bolivian economy to one of the most robust in the continent. One of its most determined goals is to raise the average caloric intake of Bolivians from a low 1,800 calories per day to 2,400. The plan required the investment of $1,300 million for the next decade, and was favorably received by all interested agencies.

At the same time, responsible Bolivians criticized the slowness of the Alliance for Progress program and said that Bolivia ranked tenth in the 19 countries receiving such aid, although Bolivia was truly the only country which had fulfilled the requirements of the program. In 1962, two United States Peace Corps contingents arrived in Bolivia.

Bolivia engaged in a bitter dispute with Chile which led first to diplomatic rupture on April 16 and then to the temporary walkout of Bolivia from the Organization of American States on September 3. The dispute was caused by Chile's construction and operation of a hydroelectric dam that diverted for irrigation purposes the waters of the Lauca River, which has its source in Chile but flows through Bolivia. Bolivia charged that this was contrary to all the principles of international water rights. Efforts were made to settle the dispute, but anti-Chilean demonstrations occurred in Bolivia.

Riots between pro-Communist and anti-Castro demonstrators occurred in some Bolivian cities during the Cuban crisis in late October. Bolivian Foreign Minister José Fellman Velarde, who is generally considered to favor Castro, recalled Bolivian Ambassador Victor Andrade from Washington after the latter had supported the United States quarantine of Cuba.

CHARLES W. ARNADE,
Professor of History,
University of South Florida.

BOOK PUBLISHING AND SALES

Consolidation rather than notable growth characterized the book industry in 1962. Year-end figures reflected a new spurt in sales, however, negating midyear deficits caused by the stock market decline and national economic uncertainty. Publishers and booksellers approached 1963 with more than usual confidence.

Highlighting industry adjustments in 1962 was overproduction of paperback titles, especially in "quality" lines designed for the general trade and educational market. Paperback titles in print totaled 20,000, a 100% increase over the past four years. The bookseller became more selective, and publishers sought new outlets in school libraries, book fairs, and school-operated student bookstores.

The year's many excellent novels restored a high degree of intellectual respectability to fiction. Katherine Anne Porter's *Ship of Fools* and William Faulkner's *The Reivers* made notable contributions to the revival. The list of art books continued to reflect the affluence of the times by offering many high-priced items of special appeal. One four-volume set, *Great Master Drawings of All Times,* was priced at $160. Another, also in four volumes, *The Magnificence of Rome,* sold for $200.

The American Booksellers Association made its quadrennial White House presentation of some 200 specially selected books to the president. The Century 21 Exposition (Seattle World's Fair) contained an exhibit entitled "Library 21," designed to demonstrate future library research and bibliographical techniques.

American book exports in 1962 exceeded $100 million for the first time. Secretary of State Dean Rusk, at the suggestion of Attorney General Robert Kennedy, established an official Government Book Industry Advisory Committee to consolidate the activities of government agencies (the United States Information Agency, the Cultural Division of the State Department, and the Agency for International Development) with international programs of the American Textbook Publishers Institute, the American Book Publishers Council, and the American Booksellers Association.

Censorship continued to be a problem in 1962. Over 400 legal actions remained unsettled at the end of December. The newly organized Citizens for Decent Literature, a general-membership national organization, sent spokesmen to appear before local groups to advocate police and court action. One of the books widely involved was Henry Miller's *Tropic of Capricorn,* and another was the paperback edition of Harold Robbins' *The Carpetbaggers.* There was also evidence that private right-wing groups were bringing increased pressure on school administrators to exert ideological censorship on textbooks and school library reading material.

In fiction, J. D. Salinger's *Franny and Zooey* led in sales early in the year, and *Ship of Fools* was at the top of the best-seller list at midyear. *Fail-Safe* by Eugene Burdick and Harvey Wheeler took first place in response to the publicity impetus indirectly generated by the Cuban crisis. Fletcher Knebel and Charles W. Bailey, II's *Seven Days in May,* Allen Drury's *A Shade of Difference,* James Jones' *The Thin Red Line,* and Anne Morrow Lindbergh's *Dearly Beloved* were near the top of all lists as the year came to a close.

In nonfiction, Louis Nizer's *My Life in Court* stayed within the first three places of sales lists throughout the year. Other best sellers were Frederic Morton's *The Rothschilds,* Rachel Carson's *Silent Spring,* and John Steinbeck's *Travels With Charley in Search of America.* Also published during the year were such disparate best sellers as Her-

man Taller's *Calories Don't Count*, Robert Frost's *In the Clearing*, *The New English Bible*, *The J.F.K. Coloring Book*, H. G. Brown's *Sex and the Single Girl*, and Barbara Tuchman's *The Guns of August*.

A total of 21,904 titles were issued in 1962, as compared with 18,060 in 1961. The 1962 figures by category, with 1961 totals in parentheses, are as follows: fiction, 2,942 (2,630 in 1961); philosophy and ethics, 653 (565); religion, 1,455 (1,290); technical, 931 (781); juvenile, 2,584 (1,626); general literature and criticism, 1,097 (888).

(See also AMERICAN LITERATURE; CHILDREN'S LITERATURE.)

JOSEPH A. DUFFY,
Executive Director,
American Booksellers Association.

BORNEO

The world's third largest island (286,969 square miles), Borneo is located in the Malay Archipelago north of Java and southwest of the Philippines. Kalimantan, a division of Indonesia (q.v.), occupies most of the island; British Borneo, on the north coast, consists of the colonies of Sarawak and North Borneo and the protected sultanate of Brunei.

	Sq. Mi.	Population	Capital	
North Borneo[1]	29,388	454,421[2]	Jesselton	(21,714)[2]
Sarawak	48,250	744,529[2]	Kuching	(149,456)[3]
Brunei[4]	2,226	83,877[2]	Brunei	(37,511)[2]
Total	79,864	1,282,827		

[1] Includes island of Labuan (35 sq. mi.). [2] Census of Aug. 10, 1960. [3] Census of June 15, 1960. [4] Divided by Sarawak into two coastal enclaves.

A revolt against British rule broke out in Brunei on December 8, but the uprising was crushed within five days by British troops and forces loyal to the sultan of Brunei. Since Jan. 1, 1962, Sarawak and North Borneo have comprised a free-trade area for domestic goods, with a common tariff on some external products. An agreement to establish the Federation of Malaysia, a union of Malaya, Singapore, and British Borneo, was concluded on July 31, 1962, after British rejection of the Philippines' claim to North Borneo; the union is scheduled to take effect in August 1963 (see MALAYA; PHILIPPINES).

The Malayan dollar (M$) equals 32.67 U.S. cents.

NORTH BORNEO

The governor (Sir William A. C. Goode, since April 20, 1960) is assisted by a 12-member Executive Council and a 25-member Legislative Council. Government ordinary revenue, 1961: M$68,105,459; expenditure: M$62,670,339; special (economic development) budget revenue: M$24,475,726; special expenditure: M$19,496,122, financed from Colonial Development and Welfare funds, loans, and local revenue.

Education.—Primary education is provided mainly in Malay, Chinese, and English (110 government and 305 grant-aided schools); secondary education is principally in English (6 government and 22 grant-aided schools, and one trade school and a teacher-training college, both maintained by the government). There is also a training center for rural teachers, as well as adult evening classes in commercial subjects, science, and languages. Primary school enrollment, 1962: 58,523 (70% of that age group); secondary, 5,773. Educational expenditure, 1961: M$12,902,244.

Production and Trade.—Exploitation of forests (80% of the total land area) is the basis of the economy. Chief exports, 1961: logs and sawn timber, 63.1 million cubic feet (M$102.7 million); rubber (produced for export), 23,600 tons (M$41.2 million); copra (including re-exports), 67,900 tons (M$27.1 million); manila hemp, 4,115 tons (M$4.8 million); tobacco, 326,591 pounds (M$3.6 million); dried and salted fish, 1,029 tons (M$1.6 million); and cutch (or catechu, a tanning extract), 2,961 tons (M$1.1 million). Total exports (including re-exports): M$220.3 million; imports: M$215 million, leaving a favorable trade balance of M$5.3 million.

Transportation and Communications.—A 116-mile railroad connects Jesselton with Melalap, in the interior; a 20-mile branch line runs to Weston, on Brunei Bay. In 1961 there were 928 miles of road (350 miles hard-surfaced). Work is in progress on a road network that will connect the main centers of population. Malayan Airways Ltd. provides scheduled flights from Sandakan (1960 census pop., 28,805) and Jesselton to Brunei, Sarawak, and Singapore. Borneo Airways Ltd. operates internal services and regular flights to Sarawak and Brunei.

SARAWAK

The colony is administered by a governor (Sir Alexander Waddell, since 1960), assisted by a 10-member Supreme Council and the legislative Council Negri (45 members, including 24 elected). Estimated 1962 revenue: M$77,135,600; current expenditure: M$68,616,336; capital expenditure: M$54,246,750.

Education.—Number of schools (with enrollments), 1961: 887 government and grant-aided primary (97,577); 25 unaided primary (1,432); 48 secondary (11,244); 2 teacher-training (318); and 1 vocational (68).

Production and Trade.—Oil refining and rubber production are the major industries. Chief exports, 1961: petroleum (mostly produced in Brunei and shipped from Sarawak), 3,670,000 tons (valued at M$221.9 million); rubber, 46,900 tons (M$83.3 million); logs and sawn timber, 21.2 million cubic feet (M$41.6 million); and pepper (M$28.6 million). Total exports: M$397.2 million; imports: M$411.7 million, including crude oil worth M$189.9 million.

Transportation and Communications.—In 1961 there were no railways and only 748 miles of road (415 miles hard-surfaced), but the main towns are situated on the coast or on navigable rivers. Scheduled domestic and international air services use Kuching, Sibu, and four other airports.

BRUNEI

The supreme governmental authority is the sultan, Sir Omar Ali Saifuddin (acceded June 6, 1950), who under the constitution of Sept. 29, 1959, appoints a chief minister or *mentri besar* invested with executive authority. A resident British high commissioner, Sir Denis C. White, is responsible for defense and external affairs. The sultan is advised by a Privy Council of at least 8 members, and he presides over an Executive Council of 15 members. The Legislative Council has 33 members, of whom 16 are chosen by elected district councils. Government revenues, 1961: M$111,417,390; expenditures: M$65,926,345, about half of which was expended on economic development.

Education.—About 55% of the school-age population attended school in 1959. In 1960 the 53 government Malay schools enrolled 8,601 pupils; 8 Chinese vernacular schools, 4,461 pupils; 7 private and 3 government English schools, 4,018 pupils. There is also a trade school.

Economy.—The petroleum industry provides employment for 75% of the wage-earning population, makes possible liberal social benefits (including pensions to all citizens at the age of 60), and finances the government's development program. After Canada and Trinidad, Brunei is the largest oil producer of the Commonwealth. Petroleum production, 1961: 4,049,000 tons (down 10% from 1960). Oil extracted from the Seria fields by the Brunei Shell Petroleum Company accounts for 90% of total export value; rubber ranks second in export value. Total exports, 1961: M$238.5 million; imports, M$58.3 million.

Transportation and Communications.—In 1960 there were about 300 miles of paved road. Borneo Airways Ltd. and Malayan Airways Ltd. make regular flights from Brunei to North Borneo, Sarawak, Singapore, and Malaya.

R. N. M.

BOSTON

The leading city of New England and the most populous state capital in the United States, Boston, Mass., ranks 13th in population among the nation's cities. In 1960 there were 697,197 inhabitants in the city (47 square miles) and 2,589,301 in the metropolitan area (987 square miles).

Under the city charter, the mayor (in 1962, John F. Collins) is elected for four years; the 9-member City Council and the 5-member School Committee are elected for two years. Elections are at-large and are without party designation.

The city budget for 1962 provided for the expenditure of $110,818,436. The tax rate dropped 80 cents, to $99.80. Assessed valuation as of Jan. 1, 1961: $1,467,906,900. Gross debt (Oct. 1, 1961): $144,546,500; net debt: $94,009,102.

Value of products manufactured in 1960: in the city, $1,467,757,409; in the Greater Boston industrial area (18 communities), $3,173,689,770. Employed production workers (August 1962) in the metropolitan Boston area: 293,500; average weekly earnings: $96. Consumer price index in August 1962: 107.1 (1957–59 = 100). Shipments through the Port of Boston in 1961: exports, 1,018,725 tons; imports, 6,451,129 tons.

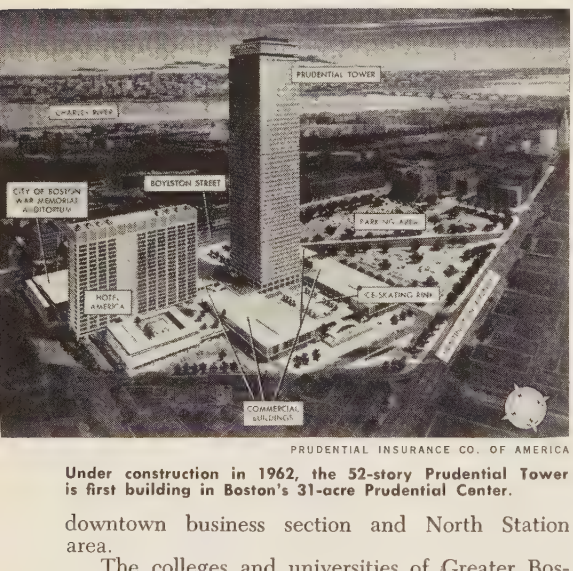
In 1962, Boston and its environs witnessed a construction boom. In the metropolitan area, the key industries of electronics and defense research continued to expand, although slowing down somewhat from their 1958–61 pace.

Although controversies over the displacement of families and businesses took place, Boston's $90 million redevelopment program made progress. In 1962 a new organization, Action for Better Community Development, was founded to ease redevelopment and relocation problems.

Construction of the 52-story Prudential Building, largest structure in the city, resumed early in the year, and plans were completed for other parts of the Prudential Center, including the first hotel to be built in Boston since 1929. Several projects stimulated by the Prudential Center in the surrounding Back Bay area were announced.

Demolition began in the area from Highway 128 into the center of the city to make way for the extension of the Massachusetts Turnpike, and in the Scollay Square area to allow the construction of the Government Center. The latter is to include a new City Hall.

The Greater Boston Chamber of Commerce sponsored a new plan for the waterfront area, and new designs were formulated for parts of the downtown business section and North Station area.



PRUDENTIAL INSURANCE CO. OF AMERICA

Under construction in 1962, the 52-story Prudential Tower is first building in Boston's 31-acre Prudential Center.

The colleges and universities of Greater Boston contributed to the building surge. Among the many projects in various stages, Massachusetts Institute of Technology and Harvard University completed the Cambridge Electron Accelerator; Boston University began construction of a building to house its schools of law and education; and Boston College planned several new buildings on its Newton campus.

After a disastrous fire in October 1961, WGBH, the educational television and radio station sponsored by the Lowell Institute, carried on a successful fund-raising drive and was given a site for a new building by Harvard University. The Museum of Fine Arts became probably the greatest repository of 18th and 19th century American art as a result of new additions to the "M. and M. Karolik Collection."

During the year several scandals were investigated by the Boston Finance Commission or by state authorities. In March, Gov. John A. Volpe ordered the dismissal of Police Commissioner Leo J. Sullivan, who resigned a week later during an investigation into alleged police collusion with bookmakers. The state legislature in April transferred the power of appointment of the police commissioner, as well as fiscal control over the police department, from the governor to the mayor.

Boston University.

BOTANY

Lichens are among the most resistant types of life on earth. They can survive and grow, although slowly, under conditions of extreme drought and exceedingly low temperatures. It has been known for almost 100 years that a lichen consists of two entirely different plants, a fungus and an alga, growing in close association. The relationship between these plants has not been well understood, and it has been variously interpreted, from that of a fungus parasitic on an alga, to that of a mutually beneficial living together. The problem has been obscured by the difficulty of bringing the fungus and alga into association with any degree of certainty to make a lichen.

Vernon Ahmadjian succeeded recently in combining the fungus and the alga, resulting in the formation of a lichen thallus.[1] If a lichen is grown under favorable conditions of nutriment and water supply, the alga and the fungus will dissociate. Under unfavorable conditions, however, such as growing the two components on purified agar without nutrients, a lichen thallus will be produced. The alga benefits by obtaining mineral salts from the fungus, and by being protected from high light intensity. The fungus, in turn, under such conditions, obtains from this association carbon and nitrogen compounds, vitamins, and various salts. The lichens thus studied were *Acarospora fuscata* and *Acarospora smaragdula.* Since it is necessary that the algal cells be contained by the fungus—under unfavorable conditions—to achieve the lichen thallus, the slow growth of lichens in nature becomes understandable.

Morphogenesis.—Morphogenesis (form development), as applied to both physical and chemical considerations, is obviously correlated with similar analyses in plants, animals, and human beings. A notable contribution to this topic was made by A. E. De Maggio and Ralph H. Wetmore[2] through the study of the early stages of development of *Todea barbara,* a fern native of South Africa, Australia, and New Zealand, related to the cinnamon, interrupted, and royal ferns. They succeeded in growing young embryos, of various ages, removed from the prothallial tissue in which they were developing.

If the embryos were removed 20 days after fertilization had occurred, and they had begun to differentiate, they could be cultured to maturity in a medium which contained mineral salts and sugar. If the embryos were taken three days earlier it was necessary to add whole coconut milk or a mixture of inositol and sorbitol to achieve development. On the other hand, if the embryos were removed 4 or 5 days after fertilization, prior to the first division of the zygote, they gave rise to structures suggestive of the haploid or gametophytic, prothallial plant, rather than of the sporophytic plant, regardless of nutritional supplements. These experiments indicate that in the very early stages of embryo development, physical (restraining) factors are important in achieving normal

[1] Ahmadjian, V., *American Journal of Botany,* 49:277–283, 1962.

[2] De Maggio, A. E., and Wetmore, R. H., *American Journal of Botany,* 48:551–565, 1961.

growth, and that subsequently the chemical requirements of an embryo change in very definite ways.

Taxonomy.—In 1958 a new and unusual liverwort, *Takakia lepidozioides,* was described. It had been collected a few years before in several locations high in the Japanese Alps, and was subsequently found in the Queen Charlotte Islands of British Columbia. It is a small plant with a delicate stem and minute, threadlike leaves, 1 to 1½ millimeters long, usually borne in pairs. There are no rhizoids, and the plant is associated with a fungus. Regeneration occurs from detached leaves. On the tips of the shoots, among closely packed leaves—and sometimes also farther down on the stem—one to three archegonia are developed. The archegonia are similar to those of other liverworts. No antheridia or sporophytes have as yet been discovered. *Takakia* has been placed in a new order, Takakiales, and family, Takakiaceae.[3, 4, 5, 6]

By study of the growing tips it was shown that the haploid chromosome number is 4. This establishes 4 as a probable basic chromosome number in bryophytes. Since most liverworts have 8, 9, or 10 chromosomes, and the Anthocerotaceae have 5, the higher numbers have probably been derived from a 4-chromosome type. Certain of the green algae also have 4, and this lends credence to the concept that the liverworts (and mosses) were derived from green algae, as has often been supposed.

Phyllotaxis.—A fresh and new interpretation of the spiral arrangements of leaves on stems has been offered by G. van Iterson,[7] who has demonstrated similarities in leaf arrangements to pulsation patterns in liquids. He has suggested further that pulsations may be caused at the growing point by shocklike growth of cell walls, resulting from the breakdown of macromolecules, or from secondary linkages between such molecules.

BRANDT, Willy

German political leader: b. Lübeck, Schleswig-Holstein, Germany, Dec. 18, 1913.

Faced with incessant crises as governing lord mayor of West Berlin since 1957, Willy Brandt has given the Berlin citizens a vigilant and spirited leadership which has won the support of Western statesmen and kept West Berlin morale and production high, despite such direct Soviet challenges as the wall which cut the city in half in 1961.

Educated in the Lübeck schools and at the University of Oslo, Norway, Brandt fled from the Nazis to Norway in 1933 and worked as a journalist and writer in Norway and Sweden during World War II. In 1945–47 he served as a representative for Scandinavian news bureaus in Berlin, and was chief editor of the newspaper *Berliner Stadtblatt* in 1950–51. He entered politics in 1948 and moved rapidly up in the Berlin branch of the West German Social Democratic Party (SPD). From 1949 to 1957 he was a member of the Federal Diet (Bundestag), and from 1957 to 1958 he was president of the Federal Council (Bundesrat). After gaining pre-eminence in the Berlin House of Representatives (Abgeordnetenhaus), Brandt was elected governing lord mayor of the city by the House in 1957, and was re-elected to a four-year term in 1959 on the basis of a coalition of the SPD and the Christian Democratic Union (CDU).

Brandt's independent leadership when the Communists built the Berlin wall in August 1961 increased his popularity and made him one of the stronger minority party politicians of West Germany. He was honored with the 1961 Freedom Award by the American Freedom House. Running against Chancellor Konrad Adenauer in the national elections in 1961, Brandt was defeated in a campaign which became bitterly personal, although he was re-elected to the Federal Diet and the SPD made major gains.

During 1962, Brandt maintained a firm West Berlin stand in the midst of continual Communist harassment along the wall and on all access routes to the city. After expressing impatience that the city's difficulties were moving no closer to solution, he visited the United States in the fall, conferring with Secretary of State Rusk (September 29) and with President Kennedy (October 5). On returning to Berlin, Brandt reported that he was confident of the backing of the United States and of continued Allied military support in the city, though he warned West Germans that "uneasy decisions" might be required in any approach to a Berlin settlement.

BRAZIL

Portuguese-speaking Brazil is the largest (3,287,195 square miles) and most populous (1960 census, 70,799,352; mid-1962 est., 75,271,000) nation in Latin America. Most Brazilians live in the eastern and southern sections of the country. The leading cities (1960 populations) are São Paulo (3,776,581), Rio de Janeiro (3,307,163), Recife (788,580), Salvador (655,735), and Pôrto Alegre (641,173). The new inland capital, Brasília, has a population (est. 1962) of 185,000. Although more than half of the people still live in a rural or village environment, the growth of the cities is quite rapid.

Government.—Jânio da Silva Quadros, installed for a 6-year term as president in January 1961, resigned on August 25 of that year. On September 7, Vice President João Belchior Marques Goulart was inaugurated to fill out the term to Jan. 31, 1966, but only after the National Congress had approved (September 2) a constitutional amendment establishing a parliamentary system. Thereafter the president of the Council of Ministers (cabinet), popularly known as the premier, shared executive power with the president and was responsible with the cabinet to the National Congress. The amendment also provided for a plebiscite on the new system before the end of the present presidential term.

Legislative power is vested in Congress, which consists of a Chamber of Deputies of 409 members and a Senate of 66. The federal judiciary is headed by an 11-member Supreme Court. Brazil is a federal republic, and each of the 22 states (Acre became a state in 1962) has an elective governor.

Education and Religion.—Probably more than half of the people are illiterate, and the rapid increase in the population makes it difficult to reduce the percentage, given current financial conditions. Traditionally, higher education has been favored over other types, but an education law of December 1961 was designed to correct this imbalance. In 1961 some student groups agitated against the traditional overemphasis on legal education in the higher institutions of learning. In that year, 4,000 lawyers, but only 1,500 physicians and engineers, 1,200 dentists, and 600 agronomists, architects, and veterinarians, were graduated.

In 1960 there were 100,000 primary schools, with 220,000 teachers and an enrollment of 7.7 million; 3,698 secondary schools, with 58,296 teachers and an enrollment of 868,178; 1,234 training schools for secondary teachers, with 13,289 instructors, and an enrollment of 90,727; 1,835 technical schools, with 22,551 teachers and an enrollment of 218,522; and 1,115 institutions of higher learning or for higher teacher training, with 21,064 instructors, and 93,202 students.

Most Brazilians are Roman Catholic, but freedom of worship is allowed to all.

WIDE WORLD

Brazil's President Goulart (left) is greeted with a traditional ticker-tape parade in New York City on April 5 as he begins a five-day official visit to the United States.

Finance.—Most aspects of the financial picture remained dark in 1961. Some relief accrued from the decline in the trade deficit, this being one of the reasons that gold and foreign exchange holdings rose from $415 million on Jan. 31, 1961, to $512 million on Jan. 31, 1962. On the other hand, the inflationary process continued, in part because of government budgetary deficits and the continued emission of paper currency.

In December 1961, Congress approved a 1962 budget providing for expenditures of 574 billion cruzeiros and revenues of 439 billion, with a deficit of 135 billion. By March 1962, the government estimated the deficit at 320 billion cruzeiros, and later estimates were still higher. An example of the policies that contributed to this process was the passage on May 25 of a 40% pay raise for civil servants and the military without provision for increased revenues.

The number of cruzeiros in circulation increased by 108 billion in 1961 and by 65 billion in the first 8 months of 1962. One result of this and other policies was a decline in the free exchange value of the cruzeiro. Although the government revised controlled exchange rates, the difference between these and the free market rate widened. The latter reached a low of 740 cruzeiros to the dollar on Dec. 5, 1962. Inflation continued the long-time rise in the cost of living, variously calculated for 1961 at 38% to 43%. In the first 8 months of 1962 there was a rise of an additional 28.6%.

Transportation and Communications.—Road and rail networks cover only a small part of Brazil. There are 23,823 miles of railroad, about 8,680 miles of paved roads and possibly another 35,000 miles of improved but unpaved roads, and 16 domestic airlines. Communications facilities include 1,022,793 telephones (1961) and 44 television and 920 radio stations (1960).

In December 1961, a National Transportation Council was created to make transportation policy and coordinate federal investment. Controversy over the operations of foreign-owned telephone companies continued in 1961 and 1962. The most publicized incident was the expropriation on Feb. 16, 1962, by the state of Rio Grande do Sul of a subsidiary of the International Telephone and Telegraph Company. In August, a new law established a National Telecommunications Code and Council. During the year prominent Brazilians made it clear that all telecommunications (and possibly all public utilities) would eventually be state owned.

Economic Conditions.—The Brazilian government faces gigantic economic problems, involving a large and rapidly growing population, anxious to improve its living conditions, a huge national territory that poses costly transportation problems, dangerous dependence on coffee exports, and insufficient capital to develop all aspects of the economy simultaneously. The use of deficit financing and of currency inflation has aided certain types of development. It has tended also to encourage speculative activity, has pressed hard on the poorer elements, and has somewhat impeded access to international financial institutions. Nationalistic pressures on statesmen have inhibited the activity of private foreign capital, although the great promise of Brazilian resources and the Brazilian market had drawn $3.5 billion of such investment by mid-1962. The rate of private foreign investment, however, declined by 90% during the year.

The national policies have brought considerable growth, and the government claims that the gross national product increased by 6.3% in 1960 and by 7.1% in 1961. This growth has occurred largely in the industrial and commercial spheres, however, and agriculture has not kept pace. This results in continued low incomes and purchasing power in the rural areas. Furthermore, specialization in export crops and low productivity in the cultivation of common food crops necessitate expensive food imports, using foreign exchange needed for industrialization.

Agriculture.—Continued shortages of beans, rice, and sugar in Brazilian cities in 1961 and 1962 were due largely to distribution difficulties and to the retention of stocks because of unsatisfactory prices. Wheat production, on the other hand, was much lower than requirements. The 1961–62 crop totaled 776,000 metric tons, whereas national consumption requirements were set by the government in August 1962 at more than 3,000,000 tons. The result was substantial wheat imports, especially from Argentina and the USSR, and surplus wheat and corn shipments valued at $58.6 million from the United States. Exportable coffee production for the 1961–62 crop year was estimated at 29 million bags (132.76 pounds each), as compared with 22 million bags in 1960–61. In August 1962, the United Nations Coffee Conference set the Brazilian export quota at 18 million bags (40% of the world total). To try to deal with overproduction, a program was begun in June in São Paulo to cut down 2 million coffee trees, replacing them with fewer trees of higher quality. Production of other important crops in 1961–62 was as follows, in thousands of metric tons: cacao beans, 168; corn, 8,999 (1960–61); cotton, 613 (1961); cottonseed, 1,166; peanuts, 390; potatoes, 1,081; rice, 4,763; sugar, 3,722; sweet potatoes, 1,345; and tobacco, 176 (1961).

Industry.—In 1961 industrial production rose by 9%, the same high percentage of increase realized in 1960. In the first 6 months of 1962, however, the rate of growth declined to 4%, as compared with 8% in the corresponding period of 1961. While this was due mainly to reduced expansion in nonmanufacturing industry (civilian construction, electric power, and minerals), the rate of increase in manufacturing alone also declined, to 6%, as compared with 8% in the first half of 1961.

Steel ingot production totaled 2,400,000 metric tons in 1961 (up 9% over 1960) and was expected to reach 2,600,000 tons in 1962. Output of rolled iron and steel products in 1961 amounted to 1,880,000 tons (1,640,000 tons in 1960), while 291,034 metric tons had to be imported (compared with 413,861 tons of such imports in 1960).

In 1961 the automobile industry turned out 145,632 units (134,371 in 1960), and in the first 6 months of 1962 production increased by 17.1%, to an annual rate of 168,000 units. The third company in Brazil making tractors went into operation in January, under the same sort of government incentive program that had resulted in the rapid creation of the motor vehicle industry.

Mining.—In 1961, Petrobrás, the government oil monopoly, produced 34,807,000 barrels of crude petroleum, compared with 29,612,000 barrels in 1960. Natural gas production totaled 527 million cubic meters, compared with 535 million in 1960. Petrobrás drilled 248 wells in 1961, and its refining activity reached 260,000 barrels a day, a level just below domestic consumption. Total iron ore output for 1961 was expected to approxi-

mate the 9,340,000 metric tons produced in 1960. Cement production totaled 4,680,000 metric tons, and the output of manganese apparently nearly equaled the 1,000,000 tons produced in 1960.

Foreign Trade.—In 1961, Brazil reduced her foreign trade deficit to $57 million, as compared with $193 million in 1960. Imports declined from $1,462 million to $1,460 million, while exports increased from $1,269 million to $1,403 million. More than half of the value of exports in 1961 was represented by coffee. Among other exports were 6,230,000 metric tons of iron ore and 868,501 tons of manganese. The United States took the largest share (40.1%) of Brazil's exports, followed by West Germany (8.1%). The leading imports by value were machinery, fuel and lubricants, pharmaceutical products, wheat, and vehicles. The United States was the chief supplier (35.3%), again followed by West Germany (9.6%). Although Brazilian trade with Communist countries rose (and the government tried strenuously to increase the rate of such growth), exports to these nations accounted for only 6.2% of the total. In 1962, Brazil's foreign trade situation worsened, and in the first 9 months of the year she registered a $160 million deficit.

Events, 1962.—The fundamental public issue in Brazil in 1962 remained whether and how to enact drastic economic and social reforms. President Goulart, leader of the Brazilian Labor Party (PTB), made many pleas for such reforms, and in his message to Congress on March 15 said that the greatest single need was for agrarian reform. Congress, dominated by rightist and centrist parties, took little action on Goulart's suggestions, and he asserted that this demonstrated the ineffectiveness of the parliamentary system of government which the military had imposed as a condition of his succession to the presidency in 1961. Conservatives argued that the new system, under which the premier and cabinet were responsible to Congress, was necessary to guard against leftism and dictatorship by Goulart.

The left-right debate continued during 1962 to the accompaniment of economic and social distress. Government finances worsened, and private capital was frightened away by expropriations and nationalistic legislation. The Alliance for Progress (under which a $276 million agreement for aid to the northeast was signed on April 13) was stalled because of United States dissatisfaction with Brazilian policies. Inflation led to almost constant strikes, demonstrations, food riots, leftist protests, and police and military actions to preserve order.

These conditions sharpened the debate over communism and leftism in general. Such critics of Goulart as Carlos Lacerda, governor of Guanabara, found this the most important of all issues. During much of the year, Goulart's government continued a policy of resisting United States pressures for strong action against Fidel Castro's Cuba. This seemed to have the support even of moderates, partly as an expression of Brazilian independence. On October 23, however, Brazil joined with the other members of the Organization of American States in supporting United States quarantine measures in the Cuban crisis. The government continued its efforts to build trade with the Communist world, and here again conservative elements considered that ideology should be subordinated to economics. The Communist Party, though outlawed, continued to operate quite vigorously, and candidates for office often accepted its support.

The contest between Congress and president, which was at least loosely a right-left struggle, was intensified by the resignation on June 26 of Premier Tancredo Neves and his cabinet. Two candidates for the premiership became victims of the political struggle before Goulart secured congressional approval on July 10 of Francisco Brochado da Rocha. On August 10, the new premier requested Congress to delegate sweeping political and economic powers to his cabinet. Amid the ensuing debate, on August 15 the government devalued the official exchange rate of the cruzeiro for the fourth time since March 1961, an action that emphasized the inability of the government to act decisively in the face of grave economic dangers. Meanwhile, the debate over the parliamentary system came to a focus on a demand by Goulart that a plebiscite on the matter be held soon, preferably at the time of the congressional elections of October 7.

Congress and the nation at large debated this issue in a spirit of mounting tension, which culminated on September 14–15 in a leftist general strike (only partially effective), the resignation of Brochado da Rocha's government, and congressional agreement to a constitutional plebiscite for Jan. 6, 1963. By this time, Goulart had accumulated considerable backing (even among conservatives and the military) for a return to the presidential system as a necessity for effective action in the economic and social spheres. He notably received support in this regard from former President Juscelino Kubitschek of the Social Democratic Party. Hermes Lima of the PTB succeeded Brochado as premier on Sept. 17, 1962.

As the campaigning for the elections of October 7 warmed, the anti-Goulart parties tended to make the internal threat from communism the leading issue. Nearly complete returns after the election showed that the moderates and conservatives generally had maintained their dominant position. In Rio Grande do Sul the Socialist-Labor ticket, backed by outgoing Gov. Leonel Brizola, Goulart's brother-in-law, did poorly. In the important gubernatorial race in São Paulo, moderate Adhemar de Barros won over the conservative candidate and over ex-President Quadros. On the other hand, the race for the governorship of Pernambuco, which aroused great interest, was won by a leftist, running with Communist support.

After eight unsuccessful attempts, Premier Lima was confirmed in office by the Chamber of Deputies on November 30. He retained all mem-

BREWING INDUSTRY

A new beer sales record, 90,693,253 barrels of 31 gallons each, was established in the United States during the fiscal year 1962. This figure was 1,764,370 barrels higher than the previous high, established in the fiscal year 1960.

The brewing industry also set all-time high sales records in May 1962 and in the first six months of the calendar year 1962. The sales in May, 9,056,075 barrels, were 9.2% higher than the previous record for the month, established in 1960. Brewers' sales from January through June 1962 amounted to 44,912,893 barrels, 3.8% above the former record, set in 1961.

At the end of the calendar year 1961, the proportion of the United States population living in areas where the sale of beer and ale is prohibited dropped to 8%, the lowest since 1937. The 398 local option elections in 1961 resulted in an increase of 99,381 persons living in wet areas.

During the calendar year 1961, as in each of the previous six years, brewers paid more than $1 billion in state and federal taxes. Brewers also contributed over $5 billion to the nation's economy in 1961, including more than $230 million for agricultural products; $435 million for kegs, bottles, cans, and related materials and containers; and $462 million in direct salaries.

EDWARD V. LAHEY,
Chairman,
United States Brewers Association.

BRIDGE, Contract. See SPORTS, GAMES, AND SHOWS.

BRIDGES

Many large bridges were under construction and a number were completed during 1962, a year which also saw several significant innovations in bridge design and construction processes.

Verrazano-Narrows Bridge.—The two deceptively slender steel towers for this record-breaking suspension span over New York Bay were completed at the end of 1962, and the cable spinners were preparing to start work. The twin towers rise 690 feet above the choppy waters of the bay and will support the longest suspended span ever built—4,260 feet. (The main span of San Francisco's Golden Gate Bridge is 4,200 feet). About 142,500 miles of steel wire weighing 38,600 tons will form the main cables, which in turn will support over 160,000 tons of structural steel and more than 500,000 cubic yards of concrete which will comprise the 12-lane, double-deck highway span.

The Narrows Bridge will link Staten Island (New York City's Borough of Richmond) with the Borough of Brooklyn by spanning the Narrows, the main shipping channel connecting Upper and Lower New York bays. The deepest foundation for the towers is 170 feet below mean high water. The deck will clear mean high water by 228 feet. The overall length of the bridge, including its approaches, is 13,700 feet.

George Washington Bridge.—The new six-lane lower level of this span linking New Jersey and New York City was opened to traffic in August 1962. Completion of the lower deck climaxes four years of construction costing $145 million, and makes the 31-year-old structure the world's only 14-lane vehicular bridge. Until the Narrows Bridge is completed, the Hudson River span remains the third longest suspension bridge in the world. When all the complex approaches at each end of the bridge are completed, the improvement will increase traffic capacity by 75%.

Chesapeake Bay Bridge-Tunnel.—Completed sections of this $144 million, 17.5-mile crossing of Chesapeake Bay stood the test of nature with flying colors when a storm in March 1962 heavily damaged the east coast of the United States. The contractors building the trestles, tunnels, and high-level bridges that comprise the crossing did not fare so well. A $1.5 million floating pile-driving rig, patterned after the oil-drilling devices called Texas towers, was capsized, and one of the prefabricated tunnel sections being sunk into place was dislodged. Work progressed well, however, during 1962, and more than half of the 268-foot-long tunnel sections were put in place. The 325-foot-long main span of the longest of two high-level bridges included in the crossing was finished in 1962. Overall completion is due in 1964.

Lewiston-Queenston Bridge.—Traffic moved over the Niagara Gorge on the world's longest fixed steel-arch bridge late in 1962. The 1,000-foot arch is nearly a twin of the well-known Rainbow bridge, just downstream from the scenic falls and familiar to many tourists. The new four-lane bridge connects the New York State Thruway with Canada's Queen Elizabeth Way, providing a continuous superhighway between New York City and Toronto.

Soo International Bridge.—United States and Canadian construction crews in 1962 completed this bridge between Sault Sainte Marie, Michigan, and its sister city of the same name on the Canadian side of the St. Marys River. Spanning some 5,500 feet over the United States and Canadian ship canals, the structure combines continuous truss spans and continuous plate girder spans.

Columbia River Bridge.—Work started in 1962 on a 4.2-mile-long bridge across the mouth of the Columbia River where it forms the Oregon-Washington border. The $24 million toll bridge will combine steel truss spans over the navigation channels with prestressed concrete trestle similar to the Chesapeake Bay Bridge-Tunnel's low-level sections.

Sunshine Bridge.—Construction began in 1962 on substructures for this $30 million highway crossing of the Mississippi River at Donaldsonville, La. The 8,277-foot-long steel cantilever structure will be the only bridge over the Mississippi between Baton Rouge and New Orleans. Construction will take about two and one-half years.

Sherman Minton Bridge.—One of the prize winners in the American Institute of Steel Construction's 1962 "Most Beautiful Bridge" competition, this 800-foot, steel tied-arch bridge over the Ohio River was completed in 1962. The double-decked highway span links New Albany, Ind., with Louisville, Ky.

Twin Delaware Memorial Bridge.—In 1962, Congress approved creation of a Delaware River and Bay Authority, thus clearing the way for the twinning of the Delaware Memorial Bridge, familiar to many east coast motorists traveling the New Jersey Turnpike. The existing 11-year-old suspension bridge was designed to carry 16 million vehicles a year and is already handling 12 million. Tolls are paying off the cost of construction years ahead of schedule, but original agreements did not allow for diverting the toll revenues for any other purpose. The newly-created bi-state authority will build a twin next to the existing span to handle traffic crossing the Delaware River between New Jersey and Delaware.

Australia.—Impressive progress was made in 1962 on the world's longest concrete arch bridge over the Parramatta River at Sydney, Australia. The spectacular arch spans 1,000 feet and is made up of 256 hollow, precast-concrete boxes assembled to form four parallel ribs each 20 feet wide. The huge box sections weigh up to 50 tons each and measure 20 by 23 feet at the bases of the arch. The daring design includes prestressed-concrete vertical columns rising from the arch to support the roadway. The 1,900-foot-long bridge is only a mile upstream from Sydney's famous steel arch bridge, the second longest in the world. The new arch will clear the water at its midpoint by 150 feet.

Panama Canal Zone.—The first high-level bridge over the Panama Canal, the Thatcher Ferry Bridge, was opened to traffic in the fall of 1962. This important link in the Inter-American Highway is a fixed steel structure with a 1,128-foot-long, arch-truss main span. Steel erection went on as high as 384 feet above the water without disrupting traffic in the busy waterway. The roadway section of the $20 million bridge clears mean high water by 201 feet and runs 6,200 feet to reunite the Republic of Panama bisected by the canal. As a symbol of Panamanian—United States unity, the flags of both nations fly from the new span.

Egypt.—A West German construction company is building the world's longest swing bridge over the Suez Canal at El Firdan. The steel structure is a double-swing railroad bridge with a central span that will measure 525 feet in the closed position, and a total bridge length of 1,050 feet. The $5 million bridge is part of the canal's improvement program, which includes increasing its navigable width. The new bridge replaces a smaller swing bridge that was rammed by a ship and damaged severely in 1955.

Portugal.—Construction was started in 1962 on a suspension bridge over Lisbon's Tagus River that will displace Scotland's Forth Bridge as the longest in Europe. The Tagus Bridge, with its 3,323-foot-long main span, will resemble the San Francisco-Oakland Bay Bridge in design. One of its 626-foot-high towers will be supported on a pier extending a record 260 feet below the water surface. The Export-Import Bank of Washington loaned Portugal $55 million as partial financing for the bridge.

Scotland.—Cable spinners fought Scotland's unruly weather during 1962 to assemble the main suspension cables for Europe's longest suspension bridge, over the Firth of Forth. Wind gusts at times blew the catwalks used by the construction crews 30 feet out of alignment, but by year's end the 30,000 miles of wire that forms the 22-inch-diameter cables was in place and steel erection had started. The center span of the $44 million highway bridge is 3,300 feet long, for a short time the longest in Europe and fifth longest in the world.

Venezuela.—Maracaibo Bridge, one of the most spectacular prestressed-concrete bridges ever built, was opened to traffic in 1962. The 5½-mile-long highway bridge vaults the northern end of Lake Maracaibo to provide the first direct link between the city of Maracaibo, one of the world's great oil centers, and the north shore cities of Venezuela. The $80 million structure consists of 135 spans, each 56 feet wide, totaling 27,300 feet, plus 1,335 feet of causeway at one end. Five 771-foot-long main spans clear the lake's shipping channels by 148 feet. Graceful supporting structures for these sections tower 300 feet above the water.

BRITISH ANTARCTIC TERRITORY

Formerly part of the Falkland Island Dependencies, this British colony was formed on March 3, 1962. It consists of the South Orkney Islands (area, 240 square miles), the South Shetland Islands (1,800 square miles), Graham Land, and that sector of Antarctica lying between 20° and 80° west longitude. The colony is administered by a high commissioner (Sir Edwin Arrowsmith). There is no permanent population in British Antarctic Territory. Whaling and fishing are conducted in its waters. Parts of the colony are claimed by Argentina and Chile.

BRITISH BORNEO. See Borneo.

BRITISH CAMEROONS. See Index entry.

BRITISH COLUMBIA

British Columbia, with an area of 366,255 square miles, is the third largest and most westerly of the Canadian provinces. Forming part of the province are the Queen Charlotte Islands (3,866 square miles) and Vancouver Island (12,408 square miles). The population was estimated at 1,659,000 on June 1, 1962 (1,629,082 at the census of June 1961). A large part of the population is concentrated in and around the southern coastal areas of metropolitan Vancouver (1961 census, 790,165) and metropolitan Victoria, the capital (154,152). Other chief urban centers and their populations (1961 census) are: Nanaimo, 14,135; Prince George, 13,877; Penticton, 13,859; Kelowna, 13,188; Prince Rupert, 11,987; Trail, 11,580; and Dawson Creek, 10,940.

WIDE WORLD

Agile crew works on one of the principal cables for the suspension bridge across the Firth of Forth in Scotland.

Government.—British Columbia is represented in the Canadian Parliament by 6 senators (appointed for life) and 22 members of the House of Commons. The provincial government is administered by a lieutenant-governor (Maj. Gen. George R. Pearkes in 1962) and a Legislative Assembly of 52 members. The Social Credit government, headed by Premier W. A. C. Bennett, was re-elected in the general election held on Sept. 12, 1960. The party standings in the Legislative Assembly are: Social Credit, 31; New Democratic Party-CCF, 16; Liberal, 4; and vacant, 1.

Education.—Education is compulsory between the ages of 7 and 15. During the school year 1960–61 there were 321,760 pupils enrolled in 1,240 public schools and instructed by 12,137 teachers. In addition there are a number of private institutions modeled on the English public school system. Higher education is offered by the University of British Columbia at Vancouver, which in 1961–62 had an enrollment of 12,950 full-time undergraduates, and by its affiliated college at Victoria, with an enrollment of 1,741. A College of Education on the university campus at Vancouver and Victoria provides additional teacher training.

Finance.—Estimated expenditures for the year ending March 31, 1963, totaled $284,804,223, compared with $266,645,374 for the year ending March 31, 1962; revenue was estimated at $336,000,000 ($326,076,151). The 1962–63 budgeted surplus (available for capital purposes) was $51,195,777 ($59,430,777 in 1961–62).

Transportation and Communications.—The province is crossed from east to west by the Canadian Pacific and the Canadian National transcontinental railways. The Pacific Great Eastern, a provincially owned railway, operates a line running north and south from Vancouver to Fort St. John and Dawson Creek. Railway mileage as of Dec. 31, 1960, was 4,676 miles of main track and over 1,000 miles of siding. As of March 31, 1961, there were, exclusive of

urban streets, 23,681 miles of highway in the province. Trans-Canada Air Lines and Canadian Pacific Airlines operate international air routes.

Industry.—British Columbia's four major industries yielded the following returns in 1961: forestry, $685,000,000; mining, $181,079,785; agriculture, $134,250,000; and fisheries, $77,886,000. The estimated gross value of manufacturing was $1,934,590,000. The forest industry yielded 5.35 billion board feet of sawn lumber in 1961. The fishing catch, consisting chiefly of salmon, halibut, and herring, totaled 630,954,000 pounds in 1961.

As of July 31, 1962, housing units under construction numbered 5,110; building permits issued in 1961 were valued at $207,558,000. Crude petroleum production increased in 1961 to 1,018,091 barrels. Electric power generated in 1961 was 13,086,326,000 kw.-hr. The net generated capability of hydroelectric and thermoelectric generating plants in 1962 was 3,369,000 kw.

Trade.—Retail sales in British Columbia were valued at $1,664 million in 1961. Exports through provincial customs ports in 1961 totalled $1,080,784,458, and imports, $421,822,601.

Events, 1962.—Victoria, the capital, celebrated the 100th anniversary of its incorporation in June. Princess Mary, the princess royal, attended the ceremonies and opened new courts of law in the city.

Court action developed from the Provincial Government's taking over, with legislative approval, British Columbia Electric Company, Ltd., in 1961. In April 1962 the Legislative Assembly approved amalgamating the company and the British Columbia Power Commission, a governmental agency, to form the British Columbia Hydro and Power Authority.

The Legislative Assembly in 1962 approved the reconstitution of the Department of Lands and Forests into the Department of Lands, Forests and Water Resources, thus giving water development status equal to that of land and forest resources. Water development had previously been administered by a branch of the Lands Service.

Construction was begun in 1962 on the diversion tunnels for the 650-foot-high Portage Dam in the Peace River Valley in the Rocky Mountain foothills. Contracts for construction of the dam proper were expected to be let early in 1963. Hydroelectric capacity of the entire Peace River Project will be 3,150,000 kw.

The final section of the Trans-Canada Highway, the Rogers Pass, was opened in July 1962. Its completion cut in half the travel time between Vancouver and Calgary, Alberta.

A severe coastal storm moving up from California and the Pacific Northwest struck British Columbia on October 13, causing at least six deaths and much property damage.

BRITISH EAST AFRICA. See Kenya; Tanganyika; Uganda; Zanzibar.

BRITISH GUIANA

The only British possession in South America, the crown colony of British Guiana is situated on the northeast Atlantic coast of that continent. Its area of 83,000 square miles comprises three counties (named from the principal rivers): Essequibo, 61,660 square miles; Berbice, 16,920; and Demerara, 4,420. The census population of April 7, 1960, was 560,620 (mid-1961 est., 582,000), including 268,710 persons of East Indian descent and 186,800 of African origin. The capital is Georgetown (1960 pop., with environs, 148,451).

Government.—British Guiana has been an internally self-governing colony since a new constitution took effect on July 17, 1961. The British governor (Sir Ralph Grey, appointed Oct. 7, 1959) is responsible for foreign affairs and defense. A bicameral legislature consists of a House of Assembly with 35 elected members and a Senate of 13 members appointed by the governor. Political parties and number of seats held in the House (following elections of Aug. 21, 1961): the left-wing People's Progressive Party, 20; the socialistic People's National Congress, 11; and the right-wing United Force, 4. Dr. Cheddi B. Jagan, leader of the majority party, heads a People's Progressive cabinet which took office on Sept. 5, 1961.

Education.—School enrollment, 1961: 137,212 (about two thirds of the school-age population). Enrollments according to educational levels: primary, 78,300; intermediate, 51,100; secondary, 7,224; and vocational, 588.

Finance.—Government revenue, 1961 est.: BWI$56,618,825 (BWI$56,094,734 in 1960); expenditure, BWI$54,948,797 (BWI$50,294,214). National debt: BWI$4.7 million at end of 1960. The British West Indian dollar equals U.S.$0.5833.

Transportation and Communications.—Transport networks (miles, 1960): government-owned railways, 94; private railways, 80; motor roads, 318; forest roads, 244; trails, 400; and navigable waterways, 217. National airline: British Guiana Airways, Ltd., which provides internal air services. The country is also served by five international airlines. Motor vehicles (1960): 21,173; telephones, 8,158.

Production.—Principal economic sectors are agriculture and mining. Chief crops (metric tons, 1961): sugar, 325,000 (down 3% from 1960); rice, 124,000 (down 1%); coconuts; coffee; cocoa; and citrus fruits. Rum production (1961): 1,898,000 gallons. Chief minerals (1961): bauxite, 2,374,000 metric tons (down 4% from 1960); diamonds, 112,679 metric carats (up 11%); and manganese, 122,726 metric tons (1960). About 87% of the land area is forested; timber exports (cubic feet, 1961): 1,356,000 (down 5% from 1960).

Foreign Trade.—Total exports, 1961: £31.0 million (up 14% from 1960); imports, £30.6 million (down 1%). Principal exports: sugar, bauxite, rice, timber, and rum; imports: machinery, flour, and cotton piece goods. British Guiana's chief trading partners are Great Britain, Canada, and the United States.

Events, 1962.—British Guiana's first general strike in history, called to protest the government's new austerity budget, led to riots, violence, and bloodshed in Georgetown from February 12 to 19. The trouble was precipitated when Prime Minister Cheddi B. Jagan's government introduced in the House of Assembly on January 31 a budget which provided for new taxes on capital gains, property, and gifts, and compulsory savings for wage earners, in order to yield $7 million in additional revenues to finance the country's development program. Political opponents charged that the tax increases would discourage foreign investment and excessively burden workers. About 10,000 workers demonstrated on February 12 in Georgetown against the budget and called for the government to resign, and they were joined the following day by 30,000 more demonstrators. The demonstrations virtually shut down the city.

Violence flared on February 16 when demonstrators and police fought pitched battles in which six persons were killed, and rioters looted and set fire to Georgetown's business center. Prime Minister Jagan called for military assistance from Britain, and about 2,000 British troops landed (February 16–17) and restored order in the capital by February 18. The general strike was called off on the following day.

In addition to causing considerable property damage (estimated at $28 million) that dealt the economy a staggering blow, the riots cast doubt on the ability of the Jagan government to either command popular support, maintain law and order, or lead the nation to independence. The disturbances also engendered further racial bitterness between the East Indian supporters of the government and the largely Negro opposition elements. As a further result of the violence, more than 5,000 persons left the colony for Britain and other countries by mid-March. A report issued on October 3 by a three-member British committee of inquiry ascribed the cause of the riots to popular resentment against the allegedly pro-Communist Jagan government.

The government modified its budget requests, but the new budget, which retained provisions

for compulsory savings and other reforms, was defeated in the assembly by a narrow 14-to-13 vote on April 26. Prime Minister Jagan visited England and the United States in May to seek financial aid; he was unsuccessful, however, in obtaining all the immediate aid he wanted, although Britain promised $11 million in assistance over the next three years. Jagan precipitated another crisis on June 15 by dismissing Balram Singh Rai as minister for home affairs because of the latter's outspoken criticism of Jagan as being pro-Communist, but threatened demonstrations by opposition elements failed to materialize.

A constitutional conference, held in London from October 23 to November 6, failed to reach agreement on a new constitution for British Guiana and therefore did not set a date for the colony's independence. Jagan's proposal that new elections by direct popular vote be held after independence was rejected by the opposition leaders, who wanted the elections to be based on proportional representation and to take place before independence.

W. R. F.

BRITISH HONDURAS

Located in Central America on the Caribbean Sea, the crown colony of British Honduras has an area of 8,866 square miles and a population (1960 census) of 90,019. About 60% of the inhabitants are English-speaking and of mixed Negro-white parentage. The northern and western districts and the deep south are inhabited by Spanish-speaking Maya Indians; Caribs predominate in the southern districts of Stann Creek and Toledo. The capital and chief port is Belize (1960 pop. 32,824).

Government.—The chief executive is the governor (Sir Peter Stallard, appointed in March 1961), who is assisted by an 8-member Executive Council. The principal law-making body is the 25-member Legislative Assembly, 18 members of which are elected by universal suffrage. In the elections of March 1, 1961, the left-of-center People's United Party won all 18 seats. The party's leader, George C. Price, became the first minister.

Education and Religion.—School enrollment, 1960: primary, 21,002; secondary, 1,598; technical, 96; teacher-training, 38; special, 23. More than half the population is Roman Catholic; most of the remainder is Protestant.

Finance.—The estimated government budget for 1962 was balanced at $BH8,730,945 ($BH9,538,847 in 1961). One British Honduran dollar equals U.S.$0.70.

Transportation and Communications.—Main roads total 280 miles; feeder roads, 131 miles. Four foreign airlines serve Stanley International Airport near Belize; Maya Airways operates airline service within the country. A freighter-passenger steamship service connects Belize with Jamaica. The government-operated telecommunication services were relinquished to private enterprises in 1962.

Production.—About 90% of the total land area is forested, and only about 600 square miles is cultivated. The timber industry (mahogany, cedar, and pine), which has been the basis of the country's economy, has declined in recent years, while the production of sugar and citrus fruits has expanded. Production for export (thousands of pounds, 1960); grapefruit, 3,599 (1,568 in 1959); oranges, 155 (40.6); grapefruit juice, 2,119 (1,775); orange juice, 8,890 (5,040); sugar, 11,100 tons (14,100); mahogany logs, 36,100 cubic feet (32,100); other logs, 73,500 cubic feet (174,000); sawn timber, 917,000 cubic feet (1,183,000).

Foreign Trade.—Total exports, 1960: £2,840,000 (£2,390,000 in 1959); imports, £4,700,000 (£4,890,000). Major exports were timber, citrus products, sugar, chicle gum, lobster, and fish. Chief imports were food, manufactured goods, machinery and vehicles, chemicals, and fuel. The chief markets were Great Britain, the United States, Jamaica, and Mexico. Imports came primarily from the United States, Great Britain, Trinidad, and Netherlands.

Events, 1962.—The long-standing claim by Guatemala to British Honduras was raised again in late December 1961. On Jan. 21, 1962, Guatemala accepted the British offer to hold talks between the two countries, but nothing conclusive resulted during 1962. On January 21, a group of 19 Guatemalan civilians entered the village of Pueblo Viejo, burned the British flag, and hoisted the Guatemalan flag. The raiders were soon captured and several were sentenced to long terms in prison.

BRITISH MALAYA. See MALAYA, FEDERATION OF.

BRITISH NORTH BORNEO. See BORNEO.

BRITISH SOMALILAND. See SOMALIA.

BRITISH SOUTH AFRICAN TERRITORIES

Situated in southern Africa, the High Commission Territories of Basutoland, Bechuanaland Protectorate, and Swaziland are administered by a high commissioner (Sir John Maud) under the supervision of the British Colonial Office. The three noncontiguous territories have a total estimated area of 293,421 square miles, and an aggregate population (1961 est.) of 1,324,000, of which over 99% are African. The high commissioner has offices in Pretoria and Cape Town, and is assisted by a resident commissioner in each of the territories.

Events, 1962.—During the year, Swaziland moved closer to self-government through the issuance of the report of the Swaziland Constitutional Committee, which called for the establishment of a legislative council for the territory, as well as district and municipal councils. According to the report, the legislative council would be based on the principle of parity between the racial components of the population. Twelve representatives are to be elected by the Swazi National Council, and 12 are to be elected from a common European and Colored roll. The report, which was sent to the British Colonial Office, also called for the establishment of an executive council and for the elevation of the role of the paramount chief. In September, the Swazi National Council and the European Advisory Council called for the convening of a constitutional conference.

In Bechuanaland, the move toward Africanization of the civil service received an impetus through the issuance of a white paper on March 12 which called for the filling of 373 of 676 civil service positions by natives of the protectorate in the next ten years. The plan would require the expenditure of $3.5 million for education in the period 1963–68.

Unemployment in the territories remained at high levels, especially in Basutoland. It was estimated that 65,000 Basutos, 20,000 Bechuanas, and 12,000 Swazis were working in the Republic of South Africa, primarily in the mineral extractive industries.

BASUTOLAND

A mountainous enclave within the Republic of South Africa, the Colony of Basutoland (area, 11,716 sq. mi.)

Looters set fire to business center of Georgetown, British Guiana, February 16, during general strike protesting austerity budget proposed by Prime Minister Cheddi B. Jagan.

LONDON DAILY EXPRESS

has a population (July 1, 1961, est.) of 697,000, mainly Basuto tribesmen. Maseru (1956 census pop., 5,739) is the capital.

The territory is administered by a resident commissioner (A. F. Giles took office in May 1962), who works in close cooperation with the paramount chief (Moshoeshoe II, installed on March 12, 1960). They are advised by an 8-member Executive Council. The legislature, the Basutoland National Council, comprises 40 appointed members and 40 elected members, the latter being chosen by the 9 district councils, whose 162 members are elected from a common roll. In the 1960 elections, the Basutoland Congress Party won 73 seats in the district councils and 29 elected seats in the National Council.

Government revenue, 1960–61 est.: £1,865,866; expenditures, £2,393,928. In 1960 there were 1,110 schools, with an enrollment of 136,111 (about half of the school-age population). Post-secondary education is provided at the Pius XII Catholic College at Roma (167 students).

Basutoland's economy is mainly agricultural and pastoral. Chief subsistence crops: wheat, peas, maize, and sorghum. Total exports, 1960: £1,473,226; imports, £3,142,873. Chief exports: wool (£731,513), mohair (£329,456), and beans and peas (£52,516). The road network aggregates 980 miles. Maseru is linked by rail with Marseilles in the Orange Free State.

Bechuanaland Protectorate

Situated between the Republic of South Africa and Southern Rhodesia, the Bechuanaland Protectorate has an estimated area of 275,000 square miles and a population (1960 est.) of 350,000, mainly Tswana tribes. Gaberones is the administrative headquarters of the protectorate; Lobatsi is the temporary seat of the Legislative Council.

In accordance with the new constitution which took effect in 1961, the resident commissioner (Robert P. Fawcus) heads an Executive Council of 10 members appointed by the high commissioner, and is assisted by a 31-member Legislative Council, 21 of whom are elected (10 African, 10 European, 1 Asian).

Government reveue, 1961–62 est.: £2,796,820; expenditures, £2,796,820. School enrollment, 1960: 35,993 (29% of the school-age population), including 35,225 pupils in 200 primary schools. The first trade school for Africans, accommodating 72 students, was opened at Gaberones on May 5, 1962.

Dairying and livestock husbandry are basic to the pastoral economy. Some gold (203 fine ounces in 1960), manganese (14,242 short tons), and asbestos (1,849 short tons) are mined. Exports, 1960: £2,716,219; imports, £3,282,692. Chief exports: animal carcasses (£1,577,467), hides and skins (£301,155), meat products (£315,272), and cattle (£150,876).

A railroad traverses eastern Bechuanaland for 394 miles, connecting Ramatlhabama with Remaquabane. The government maintains about 2,500 miles of roads.

Swaziland

Bordering Mozambique and the Republic of South Africa, Swaziland has an area of 6,705 square miles, and a population (1961 est.) of 277,000, mostly Swazi but including 8,000 Europeans. Mbabane is the capital of the territory.

Swaziland is administered by a resident commissioner (Brian A. Marwick). The paramount chief (Sobhuza II) exercises authority over the native reserve (area, 3,516 sq. mi), and is assisted by the Swazi National Council. An elected 10-member European Advisory Council advises the government on matters affecting Europeans.

Government revenue, 1961–62: R6,106,964; expenditure, R4,557,136 (the South African rand equals U.S.$1.40). School enrollment, 1960: 36,146 (39% of the school-age population), including 34,435 in primary schools.

Chief economic sectors are agriculture, animal husbandry, forestry, and mining. Main crops (in metric tons, 1961): sugarcane (573,138), cotton (2,225), pineapples (1,823), rice (4,572), and tobacco (183,969 pounds). Mineral production, (short tons, 1961): asbestos, 30,793; coal, 1,080; barites, 454; diaspore, 492; pyrophyllite, 2,955; gold, 1,325 ounces. Exports, 1961: R12,595,614, including asbestos (R5,070,321), sugar (R3,687,000), cattle (R1,267,380), cotton (R718,604), timber products (R647,470), and rice (R389,739). Total imports, 1960: £3,946,423.

The road network aggregates 1,150 miles. On March 14, 1962, the International Development Association loaned Swaziland $2.8 million to build an all-weather highway transversing the territory from east to west for 112 miles and linking the major towns. A 140-mile railroad was under construction from Ngwenya to the Mozambique border.

J. L. L.

BRITISH VIRGIN ISLANDS

Comprising 36 islands (11 inhabited) in the Caribbean Sea, this British crown colony has an area of 59 square miles, and a population (1961 est.) of 8,000. The principal islands are Tortola (1960 pop., 6,253), Virgin Gorda, Anegada, and Jost Van Dyke. Road Town (1960 pop., 897), on Tortola, is the capital.

The government, which is under an administrator (Gerald J. Bryan, appointed in 1959), includes an 11-member Legislative Council (6 of the members are elected), and a 7-member Executive Council (3 elected). Government revenue in 1961 amounted to $772,360; expenditure, $995,692. In 1961 there were 13 primary schools, 4 community schools, a private school (aggregate enrollment, 2,118), and a government secondary school (119 students).

The economy of the colony is interdependent with that of the Virgin Islands of the United States, which lie to the west. Most of the inhabitants are farmers or fishermen. Livestock is the principal export item; most of the trade is with the United States. In 1961, exports totaled $246,112; imports, $1,325,084. Lack of water for agricultural purposes and domestic needs is a major problem, as the annual rainfall is not large for a tropical area. Tourism, particularly from the United States and Puerto Rico, has become increasingly important to the colony's economy.

BRITISH WEST INDIES. See West Indies Federation; British Virgin Islands; Jamaica; Trinidad and Tobago.

BUILDING AND CONSTRUCTION

A major component of the national economy, the value of new construction put in place in the United States in 1962 was estimated at $61.2 billion, a new record for the second consecutive year. The gain of $3.8 billion (6.7%) over 1961 doubled the increase of approximately $1.8 billion recorded between 1960 and 1961. The physical volume of construction put in place in 1962 (dollar expenditures adjusted for price change) rose only 4.2%, reflecting a moderate increase of 2.5% in construction costs.

Despite the new yearly high achieved in 1962, the seasonally adjusted annual rate of construction had fallen from the previous high of $61.0 billion in November 1961 to $56.7 billion in February 1962. Recovery during the spring was rapid, however, as volume climbed to a seasonally adjusted annual rate of $62.7 billion in June and remained above $62.0 billion through October. Both the private and public segments of the total contributed to the pace-setting volume by establishing new records. New private residential nonfarm building contributed strongly to the private sector by attaining a total value of $25 billion, up 11.3% over 1961 despite hesitation in the rate of new housing starts early in the year.

Privately financed construction expenditures of $43.7 billion or (71% of total new construction) gained significantly more than public construction by rising $3.5 billion or 8.7%. Gains in the private segment were led by expenditures for new housing units, which increased by $2.2 billion (13.7%).

A lesser gain of 5% was recorded by nonresidential buildings (nonfarm) including such building types as industrial plants; office buildings, warehouses, stores, restaurants, and garages in the commercial classification; and religious, educa-

tional, hospital, institutional, and social and recreational buildings. While the increase for the industrial buildings category was nominal (1.5%), office buildings gained 6.4%, compared with 5.9% for the stores and other buildings in the commercial category.

Continued investment in expansion and extension of public utilities services caused a rise of 6.2% in this major classification. Electric utilities contributed a gain of 6.6%, while the rate of gas installations continued unchanged to maintain the high level of outlays previously attained within the public utilities area. Petroleum pipelines in the "other public utilities" classification contributed almost $160 million to the rise in this category.

Total public construction activity, valued at $17.6 billion, added only $360 million to the rise in the year's construction volume. Highways and roads (the largest segment of public construction, which accounted for slightly more than one third of publicly financed expenditures) contributed only 2% to the overall acceleration of construction activity. The category of nonresidential public building declined by 1.6%, due in considerable part to the drop in the important school component. The brightest spot in the publicly financed construction picture was the growth of sewer expenditures, from $914 million to $1,090 million for a rise of 19.3%.

Construction outlays were a major source of strength for the national economy. While there was a slackening in the economy at midyear, construction outlays advanced sharply in the third quarter and were maintained at high levels in the fourth quarter to provide strong support for the business economy, which was also reinforced by improvement in other industrial segments, notably automobile production. At the end of the year, prevailing optimism was due in no small measure to the strength of the construction segment.

New Housing.—In 1962, 1,400,000 new private nonfarm dwelling units were started in the United States. About 25,000 farm dwellings and 35,000 public housing units brought the total number of starts to 1,460,000, the highest point since the record of 1,555,000 units in 1959, when the compilation of the new statistical series for starts was begun. The cyclical economic upturn which began in the spring of 1961 was assisted by a recovery in housing which had started late in 1960 and reached a peak 1,443,000 (seasonally adjusted annual rate) in October 1961. Then came a decline to a low of 1,152,000 units in February 1962. At the same time that starts were declining, however, permits were increasing, and starts soon followed. A rate of 1,431,000 annual starts was achieved in March and continued at about this level through October 1962, assuring a solid contribution to construction and to the general economy.

Noteworthy in the progress of housing in 1962 was the increasing share supplied by apartment construction (here defined as buildings with 2 or more dwelling units). From 20% of all starts in 1959, the proportion of multifamily dwelling units rose to 28% in 1961 and to 30% in 1962.

Influenced in part by the prevalence of apartment building, the proportion of units started inside metropolitan areas continued to increase and accounted for 70% of all units in 1962. One effect of the rising proportion of multifamily buildings was the declining value of the average housing unit. In 1962 the average value for each privately owned housing unit was $12,650, compared with $12,975 in 1961 and $12,675 in 1960. The average construction cost of new private one-family houses alone was $14,275 in 1962.

Housing starts did well in 1962 because of the sustained level of employment in the economy, high disposable personal income, and a favorable mortgage market. Ample funds were available for investment throughout the year at rates satisfactory to lenders and purchasers alike. These conditions made it possible for many builders to finance homes through conventional rather than FHA-VA channels despite the fact that conventional financing generally entails larger down payments and higher interest rates. The number of starts in FHA and VA programs as a proportion of private nonfarm starts dropped to 24%, continuing the steady yearly decline noted since 1959 and significantly below the 29% figure registered in the latter year. The number of housing units financed through conventional sources was greater by nearly 120,000 units in 1962 than in 1961. (See also CENSUS DATA, U.S.; HOUSING.)

SIDNEY GERTLER,
Acting Director, Building Materials and Construction Industries Division, Business and Defense Services Administration.

BULGARIA

A Soviet-dominated people's republic of southeastern Europe, Bulgaria has an area of 43,047 square miles and a population (est. 1960) of 7,867,000, of which 51.1% is rural. Principal cities and populations (1956 census): Sofia, the capital, 725,756; Plovdiv, 162,518; Varna, 119,769; Ruse, 83,472; and Burgas, 72,795. The major ethnic groups (est. 1952) are Bulgarians, 91%; Turks, 6%; and gypsies, 2%.

Government.—According to the constitution of 1947, the Bulgarian People's Republic has a unicameral National Assembly, consisting of 321 deputies. An electoral law promulgated in November 1961 created 67 new deputies in the Fourth National Assembly, the previous body being composed of 254. Although the constitution guarantees free elections, citizens cannot organize their own parties or place on the ballot candidates who are not acceptable to the Communist Party. The National Assembly elects and, when not in session, is represented by its Presidium; the chairman of the Presidium is Dimiter Ganev, elected on Nov. 30, 1958, and re-elected on March 15, 1962. The National Assembly also appoints the cabinet, which was headed by Premier Anton Yugov from 1956 to Nov. 5, 1962, when he and close associates were dismissed from the Communist Party Central Committee during a de-Stalinization purge. Todor Zhivkov, first secretary of the Communist Party, was elected premier by the Assembly on November 19. (See below, *Events, 1962.*)

Bulgaria has a totalitarian system of government which controls every phase of national life. Political power is wielded by the Politburo, an organ of the Central Committee of the Communist Party. The party, which claims 485,255 members (1958), is the dominant force in the Fatherland Front, which also includes the Agrarian National Union and splinter groups of one-time democratic parties. On Feb. 25, 1962, parliamentary elections, in which 99.7% of the electorate voted, were held. Fatherland Front candidates garnered 99.9% of the total vote, which exceeded 5 million. In a cabinet reorganization announced on March 19, six new ministers, protegés of party chief Todor Zhivkov, entered the cabinet. Two of the six former ministers, Internal Trade Minister Rusi Hristozov and Foreign Trade Minister Georgi Kumbiliev, were supporters of the deposed Stalinist leader Vulko Chervenkov.

Education.—Elementary education is obligatory between the ages of 7 and 15. Number of schools (with enrollments), 1960: 6,570 preschool (298,790); 5,561 primary (1,054,379); 316 secondary (158,004); 227 technical (91,891); 23 teacher-training (19,531); 19 higher (42,979); and 66 special (7,080). The University of Sofia in 1960 enrolled 56,000 regular and special (correspondence) students.

Religion.—Principal religious groups (est. 1958): Eastern Orthodox (6,000,000), Moslem (638,000), Roman Catholic (56,000), and small communities of Protestant and Jewish faiths. Leadership and administration of the Bulgarian Orthodox Church are vested in a Holy Synod, comprised of the patriarch as head of the church and the metropolitans of 11 dioceses (the patriarch serves as the metropolitan of the Sofia diocese). On May 10, 1953, Metropolitan Kiril of Plovdiv was chosen patriarch in a contrived election that was denounced by the patriarch of Constantinople. The Communist regime has drastically curtailed the cultural and spiritual work of religious institutions.

Finance.—Budget revenues, 1962 est.: 3.76 million new leva; expenditures, 3.75 million, including 2.49 million for the national economy, 0.75 million for social and cultural activities, and 0.23 million for national defense. The new Bulgarian lev replaced the old leva on Jan. 1, 1962. The official rate of the new lev was established at 10 old leva, or 1.17 to the U.S. dollar, 1.30 to the Russian ruble, and 3.29 to the British pound.

Transportation and Communications.—Transport networks (miles): roads, 16,640 (1959); railways, 3,478 (1960). Merchant marine, 1961: 80,000 gross tons. The Bulgarian airline, TABSO, provides internal and external services. Planned capital investment in transportation for 1962 was 958 million leva. Telephones: 158,062 (1959); radios, 1,431,000 (1960); and television sets, 5,000 (1960).

Agriculture.—According to Communist sources, 98% of the cultivated land in Bulgaria had been collectivized by 1961. The fourth five-year plan, initiated in 1961, called for production increases of 8.3% in agriculture, 48% in irrigated area, 140% in use of fertilizers, 70% in farm

mechanization, and 6.5% in capital investment in agriculture. In spite of increased government control, agriculture continues to be the weakest sector in Bulgaria's economy. Agricultural production in 1961 failed to achieve the annual goal of an 18.7% increase over that in 1960. The 1962 annual plan provided for an increase of 22.4% in total agricultural production, and a capital investment of 613 million leva in agriculture (7% of the year's total).

Bulgaria's primary crops (in thousands of metric tons in 1960, with 1959 figures in parentheses): wheat, 2,389 (2,437); rye, 82 (107); maize, 1,505 (1,506); barley, 622 (560); oats, 218 (244); potatoes, 478 (421); and tobacco, 61.9 (98.5).

Industry.—The fourth five-year plan, which will end in 1965, is expected to raise the country's industrial production by 70% over that in 1960. While the Bulgarian government seeks to achieve considerable increases in the production of steel, chemicals, and machinery, the main stress in the new plan is on the production and development of raw materials. Industry is to receive 70% of total capital investment (compared with 62% in the third five-year plan); of this figure 90% is assigned to heavy industry. Planned increases in electric power, metals, machine, chemical, and rubber production range between 14.1% and 17.8%; outputs of the food and textile industries are to rise by 6.9% and 4.2%, respectively. The annual plan for 1962 called for an increase of 9.9% in industrial production over that in 1961.

Chief industrial products (metric tons, 1961): steel, 340,000 tons (up 34% from 1960); coal and lignite, 18.6 million (up 9%); iron ore, 418,000 (up 2%); pig iron, 175,000 (up 29%); rolled metals, 271,000 (up 41%); crude oil, 207,000 (up 3%); cement, 1.7 million (up 10%); and electric power, 5,406 million kw.-hr. (up 16%).

Foreign Trade.—More than 80% of Bulgaria's total foreign trade is with other Communist countries, including over 50% with the Soviet Union. Trade with non-Communist countries in 1961 totaled 1,523 million leva (783 million leva in exports and 740 million leva in imports). There is a growing volume of trade with Asian and African countries, although it remains inconsequential. The fourth five-year plan provides for a substantial increase in foreign trade. The annual plan for 1962 calls for foreign trade in excess of 10,000 million old leva; exports are expected to rise by 19.9% and imports by 11.6%. Bulgaria's principal imports are wheat, petroleum products, chemicals, raw cotton, and machinery; the main exports are tobacco, metal ores, cotton and woolen fabrics, and foodstuffs.

Events, 1962.—Communist Party chief Todor Zhivkov culminated an extensive de-Stalinization campaign in November by purging 27 members from the party's 88-member Central Committee. Zhivkov announced at the opening of the 8th Bulgarian Communist Party Congress on November 5 that Premier Anton Yugov, Deputy Premier Georgi Tsankov, and five other top Communists had been dismissed as the result of alleged "grave violations of socialist legality." In addition, former Stalinist leader Vulko Chervenkov was ousted from Communist Party membership. Twenty additional Central Committee members were purged on November 14, when the Congress closed by electing a new 101-member Central Committee and a nine-member Politburo headed by Zhivkov. The latter's position as undisputed Communist leader of Bulgaria was further consolidated when the National Assembly elected him premier on November 19.

Beginning 6-day state visit to Bulgaria on May 14, Soviet Premier Nikita Khrushchev (left) is met in Sofia by Todor Zhivkov, first secretary of the Bulgarian Communist Party.

UPI

During 1962, Bulgaria continued to engage in lively commercial and diplomatic relations with African and Asian nations. Following the visit of a Bulgarian goodwill mission to the Middle East and North Africa in November 1961, Bulgaria signed a one-year trade pact with Cyprus (Feb. 2, 1962) and a long term trade agreement with Guinea (March 2). Premier Yugov visited Guinea in late March. Diplomatic relations were established with Tunisia, Morocco, Dahomey, and Ceylon. Technical and cultural pacts were concluded with Iraq, Ghana, Mali, Sudan, Syria, Nigeria, and Cuba. The number of African and Asian students attending Bulgarian schools rose to 1,500 in mid-January.

Relations with Yugoslavia showed steady improvement during 1962, but relations with Greece deteriorated. In late January, Bulgaria proposed a trinational regulation of frontier rivers and the granting of free transit zone rights in Salonika to Bulgaria. Greece ignored the overture and subsequently protested against two alleged Bulgarian violations of Greek airspace on July 12.

Bulgaria claimed that a Bulgarian MIG fighter plane which had crash-landed in Italy on January 20 had not intentionally violated Italian airspace, although the Italian government arrested the pilot and charged him with military espionage (see also ITALY).

On March 10, unofficial and nongovernmental delegations from Bulgaria, Greece, Rumania, and Yugoslavia convened in Sofia for the second meeting of the Committee for Balkan Understanding, and approved a resolution advocating that the Balkans should form a "zone of peace" free from the presence of nuclear weapons.

In mid-May a Soviet delegation led by Premier Khrushchev and Foreign Minister Gromyko visited Bulgaria. In Varna, on May 16, Khrushchev said that the positions of the Soviet bloc and Yugoslavia coincide in regard to many international questions, and suggested that the bloc was willing to develop and strengthen relations with Yugoslavia in numerous spheres of activity. Later in the week, in Sofia, Todor Zhivkov, first secretary of the Bulgarian Communist Party, endorsed Khrushchev's view that ideological differences did not preclude close collaboration between Bulgaria and Yugoslavia.

On May 18, Mrs. Eugenie Anderson was appointed United States minister to Bulgaria, replacing Edward Page, Jr., who retired.

On September 8, Turkey's foreign minister, Feridun C. Erkin, charged that Bulgaria was subjecting its 900,000 inhabitants of Turkish origin to pressures which aimed at eradicating all vestiges of Turkish heritage and tradition. Discrimination in the economic and social spheres against the Turkish minority also was cited. Erkin threatened the severance of diplomatic relations if Sofia failed to give full consideration to Turkey's protests. As Turkish-Bulgarian recriminations are a daily occurrence, however, charges and countercharges of the above variety are usually exaggerated.

The government announced that industrial production in the first half of 1962 had overfulfilled its goal by 2.4%. Coal, steel, copper products, and internal combustion engines were areas of overfulfillment. Official reports during the year admitted a continued lag in agriculture. Although the number of sheep and cattle rose, the number of poultry and pigs, as well as milk and egg production, declined. On July 29 the government announced increases in the retail prices of certain foods, ranging from 11.5% on eggs to 31.8% on dairy products. As the result of a poor harvest due

to widespread drought, rationing of some basic foods reportedly went into effect late in the year.

Bulgaria's concern with the loss of Western markets and with economic competition was manifested in attacks on the European Economic Community. Dimitur Velikov, a Communist theoretician, asserted on July 15 that a rise in the community's customs duties against nonmember nations would result in a loss of nearly 9 million leva for Bulgaria by 1960.

In late September the government announced a 20-year plan, similar to the Soviet program introduced in 1961, which aims to increase Bulgaria's national income by 500% and industrial production by 800% by the year 1980.

BURMA

This Southeast Asian republic on the Bay of Bengal has an area of 261,742 square miles, and is bordered by East Pakistan, India, Tibet, China, Laos, and Thailand. The Union of Burma (inaugurated Jan. 4, 1948) comprises Burma proper (160,490 square miles, including the Chin Hills Special Division), and the Shan (61,043), Kachin (33,903), Kayah (4,506), and Karen (1,800) states. The population totals 21,527,000 (mid-1961 est.). Principal cities and populations (1955): Rangoon, the capital and chief port, 737,079; Mandalay, 185,867; Moulmein, 102,777; and Bassein, 77,905. Burmese is the official language; English is taught as the second language.

Government.—The constitution provides for a president (U Win Maung since March 13, 1957) elected for a 5-year term, and a Parliament consisting of a 125-member Chamber of Nationalities (partly elected, partly nominated by the various states), and a 250-member Chamber of Deputies, popularly elected for a 4-year term. Each state has its own legislature. U Nu returned to power in 1960 as prime minister but was ousted by Gen. Ne Win, chief of staff of the armed forces, who suspended the constitution and took over the government on March 2, 1962 (see below, *Events, 1962*).

Education and Religion.—School facilities (with enrollments), 1959–60: 11,557 primary schools (1,543,874 pupils); 520 middle schools (172,581); 273 high schools (47,660); 965 private schools (132,831); and 6 teacher-training colleges (2,791 in 1960–61). Higher education is provided by the University of Rangoon (3,329 enrollments in 1961–62), the University of Mandalay, and the University for Adult Education; there are intermediate colleges at Moulmein, Kyaukpyu, Magwe, and Bassein. Legislation making Buddhism (professed by 84% of Burmese) the state religion was enacted Aug. 17, 1961, but nullified March 2, 1962.

Finance.—The unit of currency is the kyat (K4.790 equal U.S.$1). Government receipts in the first half of fiscal 1961–62: K569 million (exceeding the budget estimate by K8 million); expenditures, K548 million (in the corresponding period of 1960–61: receipts, K403 million; expenditures, K568 million). Internal public debt: K1,519 million in April 1962 (K1,495 million in April 1961). Foreign exchange reserves: K561 million in April 1962 (up K55 million from a year earlier).

Transportation and Communications, 1960–61.—All internal systems are state owned. Burma Railways: passenger miles, 918,764,000; freight ton-miles, 434,599,000. Inland Water Transport Board: passengers, 4,675,000 (down 295,000 from 1959–60); freight tons, 1,088,000. Union of Burma Airways: passengers, 152,788 (up 36,388 from 1959–60); passenger miles, 24,555,000 (up 4,270,000); freight ton miles, 652,000 (up 84,000); international passengers exceeded 400,000. International seaborne tonnage: 2,851,000. Highways maintained: 6,700 miles; new roads under construction, 1,700 miles.

Economic Indicators.—Gross national product, 1959: K5,468 million; national income: K4,920 million in 1960 (K4,637 million in 1959). Index of agricultural production (1952–57 = 100): 113 in 1959–60 (107 in 1958–59). Rangoon consumer price index (1958 = 100): 102 in 1961.

Manufactures and Minerals.—Chief output of state industries (1960–61): cotton yarn, 8,814,000 pounds (up 242,000 from 1959–60); raw silk, 78,752 pounds; cement, 42,821 tons; cigarettes, 1,208.7 million; brine salt, 132,775 tons; sugar, 42,431 tons; bricks, 10,928,000; jute bags, 8,336,000; molasses, 18,027 tons. Oil production (thousand gallons, 1960–61): crude oil, 145,230 (up 3,432 from 1959–60); kerosine, 24,629 (down 1,103); gasoline, 43,698 (up 1,193); other fuel oil, 30,247. Mining production (1960–61) included: lead ore and concentrates, 27,006 tons; zinc, 12,713 tons; mixed tin and tungsten, 1,151 tons; refined silver, 1,373,000 ounces.

Agriculture.—Paddy acreage (1961–62): 10,574,409; rice production, 6,556,000 metric tons (1960–61: 10,370,787 acres; 6,789,000 metric tons). Output of cotton, peanuts, and wheat increased in 1961–62. Teak extraction (cubic tons, 1960–61): 175,200 (down 86,234 from 1959–60). Other hardwoods: 408,600 (down 185,829).

Foreign Trade.—Total imports, 1960–61: K1,080.4 million; total exports, K1,012.2 million. Chief imports (in million kyat, 1960–61): machinery and transport equipment, K172.8; base metals, K99.5; gunny sacks, K44.5; and consumer goods, K804.4 (including cotton fabrics, K138.2; cotton yarn, K69.7; dried milk, K47.9; and pharmaceutical products, K31.2). Chief exports (with tonnage and value in million kyat): rice and rice products (1,541,000 tons), K664.4; other agricultural products (372,000 tons), K177.1; teak (94,000 tons), K91.9; and base metals and ores (29,000 tons), K34.9.

Events, 1962.—Declaring that Burma was in danger of becoming "another Laos," Gen. Ne Win, chief of staff of the armed forces, took over the government on March 2 at the cost of a single civilian casualty. The constitution was suspended, and both chambers of Parliament were dissolved. Arrested and held in detention were President Win Maung, Prime Minister U Nu (who had returned to power in 1960 after being ousted in a less drastic coup by Ne Win in 1958), five other ministers, tribal princes, and numerous dissident leaders in the Shan and four other states, where existing regional councils were dispersed and five new Supreme State Councils were instituted.

The U Nu government, it was alleged, had become incapable of assuring external security, and had reacted weakly to threats of the Shan state to secede. Failing to prevent "spiraling prices," it had risked further curtailment of the country's international trade by moving to socialize import business. (At the time of Ne Win's return to power, Burma's foreign exchange transactions showed a deficit of K20 million, compared with a deficit of K15 million a year earlier, while rice exports in 1960–61 had fallen a half million tons short of the requirements of the 4-Year Plan).

The military takeover accomplished, a 17-member revolutionary council was formed on March 3; its authority received the de facto recognition of the United States and other principal governments, Washington officials viewing the army coup as a "purely internal political change" without effect on Burma's policy of nonalignment in the international field. A new cabinet took office headed by Ne Win as prime minister, who assumed responsibility also for defense, finance, revenue, judiciary, and national planning. Soon afterward, the Supreme Court and the High Court were abolished; in their place a Chief State Court of six new judges was established. Additional special courts were set up, with power to impose the death sentence for acts of insurrection, following a riot on the campus of Rangoon University on July 7, where 15 students were killed and 27 wounded by army troops, who blew up the Student Union building.

Early in the new regime the business community was reassured by postponement for two years of the previous administration's plan to take over Burma's import trade. Food prices eased with the removal of the ban on cattle slaughter; the licensing requirements for food dealers were liberalized; and transportation charges on consumer items were lowered. Efforts were begun to stimulate factory production.

Reviewing development plans, the new regime

cancelled "prestige projects," including a national theater and a new Parliament building. Two Russian construction projects, involving loans totaling $14 million, also were cancelled. Plans were confirmed, however, to utilize credits of $84 million by Communist China covering seven major projects in Burma. Utilizing $30 million in United States aid, the administration gave high priority to the construction of a highway between Rangoon and Mandalay. Further aid from nonofficial agencies was declined; the Ford Foundation accordingly terminated its service to Burma on July 15.

Under an economic and technical assistance agreement signed on August 30 by Burma and the Soviet Union, Burma will receive a 30-year loan of 3.5 million rubles for the construction of a reservoir at Kyetmanktaung, in Myingyan District.

The government announced on July 3 the organization of a single political group to form eventually a national party capable of taking over the leadership of Burma.

A Burmese-Chinese joint commission concluded a survey in 1962 of a common boundary of 1,370 miles, involving 402 boundary markers between the two countries.

Author and Publicist.

BURUNDI

The Kingdom of Burundi became an independent country on July 1, 1962, when the former Belgian-administered United Nations trust territory of Ruanda-Urundi achieved independence as the separate states of Burundi and Rwanda (q.v.). Burundi is situated in east-central Africa and is bordered by the Republic of Rwanda on the north, Tanganyika on the southeast, Lake Tanganyika on the southwest, and the Republic of the Congo on the west. The new nation's total area of 10,747 square miles is nearly equal to that of Belgium.

As of Dec. 31, 1960, Burundi's indigenous population totaled 2,234,144: (About three fourths of some 8,000 Belgians living in Ruanda-Urundi left the territory prior to independence.) The Hutu (Bahutu), agriculturalist tribes of Bantu ethnic composition, comprise about 85% of the population; the Tutsi (Batutsi or Watusi), Hamitic pastoralists noted for their tall stature, account for about 14%. Capital and principal city: Usumbura (1960 est. pop., 45,000).

The Burundi flag has a red and green field quartered diagonally by a white cross whose circular intersection is inscribed with a green stalk and a yellow drum (symbolic of the power of the mwami or king).

Government.—Mwambutsa IV is the constitutional monarch (mwami) and head of state. He is advised by a Crown Council and is assisted by a National Assembly of 64 members. In elections of Sept. 18, 1961, the National Union and Progress Party, which is supported by both Hutu and Tutsi tribal chiefs, won 58 seats in the assembly. André Muhirwa, son-in-law of the mwami, was elected premier by the assembly on Oct. 20, 1961.

Education and Religion.—Most schools are conducted by Christian missions, chiefly Roman Catholic. About 40% of children aged 7 to 12 attend school, but only about 1% proceed beyond the elementary level. School enrollment (in Ruanda-Urundi, 1960): 270,809, of whom 262,058 were enrolled in African primary schools. About half the population is Catholic (2,377,577 adherents in Ruanda-Urundi, 1960); there are small Protestant and Moslem minorities.

Finance.—Trust territory revenue, 1960: 817.2 million francs; expenditure, 1,468.5 million (the Ruanda-Urundi franc equals the Belgian franc; 50 francs equal the U.S. dollar). Belgian aid toward meeting budget deficits totaled 700 million francs from 1958 to 1962. In addition, Belgium contributed 4,200 million francs for Ruanda-Urundi's ten-year development plan (1952–61). Territorial debt: 5,201.6 million francs in 1960.

Transportation and Communications.—Burundi has no railways or navigable rivers, but steamboats connect the port of Usumbura, on Lake Tanganyika, with the Tanganyika Railways. Road network (Ruanda-Urundi, 1961): 6,600 miles. Usumbura and Kitega have airfields and radio broadcasting stations. Telephones (1960): 2,407.

Production.—About 90% of the population is engaged in farming and livestock raising (1.1 million catttle and 1.8 million goats in Ruanda-Urundi, 1960). Main subsistence crops: beans, manioc, and sweet potatoes (totaling 5.6 million metric tons in the trust territory, 1960). Chief products (with metric tons exported from Ruanda-Urundi in the 1960 crop year): coffee, 20,675; cotton fiber, 3,000; cottonseed cake and oil, 4,400; palm oil, 1,063; tobacco, 1,231; and hides and skins, 750. Principal industries: food processing, textile manufacturing, and mining (exports of cassiterite and amblygonite totaled 5,000 metric tons in 1960).

Foreign Trade.—Direct exports from Ruanda-Urundi, 1960 (in million francs): 2,250; imports, 2,488. Coffee accounted for about 90% of total export value. Chief imports: machinery, vehicles, fuels, cement, and foods. Belgium was the trust territory's chief trading partner.

Events, 1962.—The heavily populated, economically underdeveloped Kingdom of Burundi achieved independence on July 1 after comprising part of the Belgian territory of Ruanda-Urundi for 39 years (under a League of Nations mandate from 1923, and as a United Nations trusteeship since 1946). Independence ceremonies held in Usumbura on that date were simple and subdued (more extravagant celebrations took place on August 15); Mwami Mwambutsa IV reviewed the new Burundi Army, thanked Belgium for granting independence, and called on all Burundi citizens to unite in building a "happy, peaceful, and hard-working country."

(Left) Celebrants in Usumbura mark the independence of Burundi on July 1. (*Right*) Burundi's new flag is raised as guard of honor salutes.

WIDE WORLD

Independence for the former trust territory as two separate states was approved by the U.N. General Assembly by a vote of 93 to 0 on June 27. The resolution called on Belgium to withdraw troops from the former territory by August 1 unless the new nations requested that they remain; established a technical aid group to assist the state administrations; and authorized the expenditure of up to $2 million for maintaining essential services in both countries. A United Nations commission had reported (June 6) that the trust territory should become separate countries because "mutual distrust" by the leaders in both states precluded political unification. The commission had previously arranged (in April) for an agreement to continue existing monetary, customs, telecommunications, and limited fiscal unions between the two states. Burundi and Rwanda were admitted to the United Nations on September 18.

Fears that anti-Belgian riots might break out in Burundi after independence proved groundless. The Burundi government appeared to be in firm control of the country, so that the withdrawal of Belgian troops and the exodus of most Belgian and other European civilians did not disrupt public law and order. Unlike Rwanda, Hutu and Tutsi tribal leaders in Burundi cooperated in forming a stable government, for Premier André Muhirwa's ruling National Union and Progress Party, although dominated by Tutsi leaders, has considerable Hutu support.

Although a peaceful transition to self-government was accomplished, the primitive and underdeveloped country faces many financial and economic difficulties, including a first-year budget deficit estimated at $10 million. As the economy is far from being self-sufficient, Burundi will probably be dependent on foreign aid and technical assistance from the United Nations, Belgium, and other countries for many years.

W. R. F.

BUSINESS DATA, U.S.

There were an estimated 4.8 million business concerns operating in the United States at the beginning of 1962—about 40,000, or almost 1%, more than a year earlier. (This figure excludes several million farms which are not counted in the statistics summarized in Table 1.)

About 440,000 new businesses were established in 1961, roughly the same number as in 1960 when a 10-year record of new business formations was reached. Nearly 400,000 companies discontinued operations in 1961 (3½% over 1960).

Table 1—NUMBER OF FIRMS IN OPERATION AND NUMBER OF NEW AND DISCONTINUED BUSINESSES, 1960–62

(Thousands)

	1960	1961	1962[1]
New businesses formed	438	437	...
Businesses discontinued	384	398	...
Firms in operation, January 1:			
All industries	4,658	4,713	4,752
Contract construction	476	477	473
Manufacturing	323	322	318
Wholesale trade	317	322	326
Retail trade	1,997	2,011	2,022
Service industries	872	895	917
All other	674	686	696

[1] Based on incomplete data. (Source: U.S. Department of Commerce, Office of Business Economics. Estimates based primarily on data from the U.S. Department of Health, Education, and Welfare, Bureau of Old-Age and Survivors Insurance.)

The number of discontinued businesses was greater than the number of new formations in two broad industry groups—contract construction and manufacturing. The net increase in the aggregate of operating concerns occurred primarily in the service industries and retail trade.

The slight contraction in the number of firms involved in commodity production (construction and manufacturing) was, in part, a reflection of the 1960–61 business recession and was a repetition of their 1957–58 experience. On the other hand, concerns in the distribution and service industries continued to expand in number during both cyclical slowdowns.

The great majority of American firms are classed as "small business," many of them having no more than three paid employees. Approximately 90% of all jobs in private nonfarm business are provided by larger concerns, however.

Fixed Capital Investment.—The amount of capital required for the business operations of corporations in the United States is shown in Table 2. More than a million corporations have combined total gross assets valued on the companies' books at $1,400 billion. This total includes not only plant, equipment, and inventories, but also the financial assets of banks and other enterprises.

The capital needed to carry on a business, like the number of employees, varies a great deal from one line of activity to another. The average corporation in trade, services, or contract construction has total assets of about $250,000, while communications companies average $7 million in assets and public utilities $16 million. There are also, of course, wide differences within industries.

Investment in New Plant and Equipment.—The gross assets of corporations shown in Table 2 have been accumulated over a period of many years, as have those of noncorporate business. New investment purchases in excess of amounts required for

the replacement of obsolete and worn-out equipment have brought about a steady growth in capital assets.

The country's capacity to produce was at a high level in 1962, and business expenditures for new plants and equipment were estimated at $37.2 billion, almost $3 billion above purchases in 1961. (See Table 3.)

Table 3—EXPENDITURES ON NEW PLANT AND EQUIPMENT BY U.S. BUSINESS, 1960–62[1]

[1] Data exclude expenditures of agricultural business and outlays charged to current account. [2] Estimates based on anticipated capital expenditures reported by business in August 1962. [3] Includes communications, trade, service, construction, and finance. (Source: U.S. Department of Commerce, Office of Business Economics, and Securities and Exchange Commission.)

Capital spending by manufacturing firms had fallen off in 1961 from the high level of 1960, but projections for 1962 exceeded the previous high with manufacturers of durable goods increasing their outlays at a faster rate than nondurable goods firms. There was a steady increase throughout the year in the estimated quarterly expenditures of durable goods industries, while the spending of soft-goods producers leveled off.

Net Income.—Increased capital outlays by business in 1962 were in large part stimulated by the sharp recovery experienced by corporate profits. (See Table 4.)

Table 4—BUSINESS NET INCOMES, 1961–62

(Billions of dollars)

	Seasonally adjusted at annual rates[1]					
		1961 (Quarter)			1962 (Quarter)	
1961	I	II	III	IV	I	II
Corporate profits 45.6	39.8	44.8	46.3	51.4	50.1	50.9
Taxes 22.3	19.4	21.9	22.6	25.1	24.4	24.9

Dividends 15.0	14.7	14.8	14.9	15.5	15.8	15.8
Income of nonfarm noncorporate enterprises 34.8	33.7	34.5	35.1	36.0	36.2	36.8

[1] The annual rate is the quarterly total multiplied by 4. It is designed to facilitate comparisons between full- and part-year experiences. Source: U.S. Department of Commerce, Office of Business Economics.)

Corporate earnings before taxes dropped 20% in the 1960–61 business recession to a cyclical low of $40 billion in the first quarter of 1961. Their subsequent recovery carried the total to over $51 billion in the last quarter of 1961, and profits remained at about that level into 1962.

Dividend payments to stockholders are not particularly sensitive to cyclical fluctuations, but may be expected to rise fairly steadily. Net corporate dividends in 1962 reached almost $16 billion, compared with $15 billion in 1961 and $14 billion in 1960.

Table 5 shows the industrial distribution of the recent gains in corporate earnings. The strongest advance occurred in the durable goods manufacturing industries where the biggest decline had taken place earlier. Nondurables manufacturers also improved their profits position as did most other industries, although to a lesser extent.

The nation's industrial and trading corporations with sales of $1 billion or more in 1961 are listed in Table 6 with their sales and profits totals. Of the 49 companies on the list, four were not

[1] Unincorporated place.

Government.—Chief executive and judicial officers in 1962 included Edmund G. Brown (Democrat), governor, serving a four-year term; Glenn M. Anderson, lieutenant governor; Frank M. Jordan, secretary of state; Bert A. Betts, treasurer; Alan Cranston, controller; Stanley Mosk, attorney general; Roy E. Simpson, superintendent of public instruction; and Phil S. Gibson, chief justice of the 7-member Supreme Court.

The California Legislature, which convenes annually, comprised 30 Democrats and 10 Republicans in the Senate in 1962 and 47 Democrats and 33 Republicans in the Assembly.

Legislation, 1962.—In even-numbered years legislative activity is usually restricted to a budget session, at which the budget is normally passed by the state Legislature without undue difficulty, even though approval requires a two-thirds majority in both houses. In 1962, however, confronted by the largest budget ($2.9 billion) in the state's history, the Republican minority, voting as a bloc, refused assent. This forced an extraordinary session, which, after some token reductions by Governor Brown, finally passed a budget of $2.89 billion.

The Legislature also met in special session to consider reapportionment of the state Senate and other matters. An Assembly-sponsored constitutional amendment which would have reapportioned the Senate to the advantage of heavily populated Los Angeles County was defeated in the Senate. This action induced the forces working for greater representation for the county to undertake an initiative amendment. The movement, led by Los Angeles County Supervisor Frank Bonelli, secured placement of the reapportionment measure on the November ballot, where, however, it met defeat, being turned down in every county except Los Angeles.

The special session also placed on the November ballot two amendments to raise the salary of legislators, both of which were defeated. However, the voters did approve a $270 million bond issue providing for college and university construction designed to keep California abreast of the educational needs of its citizens.

Finance.—In the 1962 fiscal year, revenue of $2,451,226,110 included $2,314,209,736 from state taxes and $2,528,180 in federal funds. Chief tax yields were the 3% general sales tax ($749,522,774), licensing ($942,605,948), and taxes on motor fuels ($363,771,305) and individual income ($299,033,797). Spending of $2,402,090,849 included $1,034,128,299 for education, $274,569,495 for health, welfare, and safety, and $318,655,817 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 76,879 teachers enrolled 2,377,918 pupils; the 414,283 junior high school pupils and 752,599 senior high pupils were taught by 46,643 teachers; and parochial schools with 8,789 teachers enrolled 319,020. College enrollment totaled 417,175.

Estimated public school spending in the 1961–62 school year totaled $2,355 million, including current expenditures of $1,600 million ($471.98 per pupil) and capital outlays of $530 million. Revenue of $2,490 million was drawn chiefly from state funds ($730 million) and local districts ($1,100 million). The state reported teachers' salaries averaging $6,849 (high school, $7,257; elementary, $6,499). Actual spending for higher education (1961 fiscal year) totaled $524,668,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 638,626 persons totaled $571,388,207. This amount included $292,828,667 for the aged and $192,544,357 for dependent children.

Transportation and Communications.—Road construction contracts awarded by the state in the 1961 fiscal year involved work on 1,431 centerline miles. *Highways and roads* on Dec. 31, 1961, totaled 150,198 miles (105,285 hard-surfaced). These served 8,590,022 *motor vehicles* (as registered on June 30, 1962), including 6,777,700 automobiles. Operating in the state in 1961 were 40 *railroads* (using, in 1960, 7,630 line miles of track) and 216 commercial, state, and municipal *airports* (served in 1960 by 25 regularly scheduled *airlines*).

Communications media included (1961) 192 AM and 89 FM *radio stations;* 30 *television stations;* 130 daily *newspapers* (circulation, 4,562,960); and (Jan. 1, 1962) 2,530,800 business and 5,768,900 residential *telephones.*

Labor Force.—The state's labor force in August 1962 included 469,000 agricultural workers. Nonagricultural employment totaled 5,245,100, compared with 5,029,400 a year earlier and an average of 4,962,400 for the full year 1961. Of nonfarm employees, 27% were in manufacturing, 21.6% in trade, and 17.6% in government services. Unemployment in August 1962 stood at 356,000, compared with 419,000 a year earlier. (See also below, *Events, 1962.*)

Manufacturing.—Manufacturing engaged 1,296,053 workers in 1960, including 862,090 in produc-

[1] For definition, see footnote 1 in the article *Industrial Production*. (Source: *1960 Annual Survey of Manufactures*.)

Mining.—California ranked third among the states in 1961 in the value of mineral output, with 7.84% of the national total. It was the sole producer of boron; ranked first in cement, diatomite, gypsum, iodine, mercury, sand and gravel, sodium sulfate, sulfur ore, and tungsten; second in asbestos, feldspar, lithium, magnesium compounds, platinum-group metals, potassium salts, pyrites, pumice, rare earth metals, sodium carbonate, talc, soapstone, pyrophyllite, and wollastonite; and third in magnesite and petroleum.

CALIFORNIA MINERAL PRODUCTION, 1961

(In short tons, except as noted)

Mineral	Quantity	Value
Boron minerals	602,613	$ 46,936,000
Cement (bbl.)[1]	41,090,000	129,836,000
Clays	3,041,000	6,405,000
Gold (fine ounces)	97,644	3,418,000
Gypsum	1,574,000	3,673,000
Lime	518,000	9,412,000
Magnesium compounds (MgO equivalent)	90,534	6,467,000
Mercury (76-pound flasks)	18,688	3,693,000
Natural gas (1,000 cubic feet)	556,241,000	157,416,000
Natural gasoline (1,000 gal.)	762,878	57,645,000
Petroleum (1,000 bbl.)	300,062[2]	729,151,000[2]
Petroleum gases (1,000 gal.)	424,767	21,805,000
Pumice	610,000	2,202,000
Sand and gravel	110,181,000	124,111,000
Stone	33,850,000	50,327,000
Talc and pyrophyllite	161,068	1,524,000
Other minerals	...	83,107,000
Total	...	$1,420,749,000[3]

[1] Excludes certain cement, value of which is included in "Other minerals." [2] Preliminary. [3] Excludes duplication of clays and stone. (Source: U.S. Bureau of Mines.)

Fisheries.—The commercial fish and shellfish catch in the state in 1961 totaled 598,965,569 pounds, a 10% increase from the 1960 total. Leading species landed were tuna (all varieties), 307,262,677 pounds, and mackerel, 141,716,498.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $2,139,908,000, compared with $2,125,452,000 for the corresponding period of 1961. For the full year 1961, income comprised $1,278,726,000 from livestock, $1,944,921,000 from crops, and $27,938,000 in government payments. Principal income sources in 1961 were cattle, $538,199,000; wholesale milk, $326,048,000; cotton lint, $291,146,000; and eggs, $173,751,000.

The state's 99,000 farms in 1959 had an acreage of 36,888,000 (8,023,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 4,232,000 cattle, 1,959,000 sheep, 40,697,000 chickens, and (1961), 227,128,000 broilers. An average of 143,000 family and 235,000 hired workers engaged in farming during 1961.

CALIFORNIA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Almonds (tons)	45,090	66,400	46,000
Apples (1,000 bu.)	8,730	10,300	10,300
Apricots (tons)	183,600	180,000	155,000
Asparagus (1,000 cwt.)	1,738	1,980	1,998
Avocados (tons)	35,680	50,000	40,000
Barley (1,000 tons)	1,589	1,772	1,716
Beans, dry edible (1,000 cwt.)	3,996	3,542	3,542
Broccoli (1,000 cwt.)	1,297	1,656	1,359
Cantaloups (1,000 cwt.)	5,939	7,097	7,260
Carrots (1,000 cwt.)	6,282	5,762	5,992
Celery (1,000 cwt.)	8,311	8,348	7,345
Cherries (tons)	26,280	27,500	28,500
Cotton lint (1,000 bales)	1,650	1,689	1,740
Cottonseed (1,000 tons)	663	682	736
Figs, dried (tons)	23,900	18,800	18,300
Grapes (1,000 tons)	2,732	2,804	2,800
Hay (1,000 tons)	6,572	7,342	7,182
Lemons (1,000 boxes)	14,952	15,000	13,500
Lettuce (1,000 cwt.)	20,404	22,030	18,743
Nectarines (tons)	25,480	54,000	50,000
Olives (tons)	50,300	44,000	50,000
Oranges (1,000 boxes)	37,000	25,000	20,800
Peaches (1,000 tons)	830	967	1,030
Pears (1,000 bu.)	15,472	14,460	15,917
Prunes (1,000 tons)	150	139	140
Potatoes (1,000 cwt.)	27,093	34,447	27,134
Rice (1,000 cwt.)	11,806	13,630	14,993
Strawberries (1,000 lb.)	168,679	207,000	199,500
Sugar beets (1,000 short tons)	3,710	4,593	5,000
Tomatoes (1,000 tons)	2,326.8	2,633	3,462
Walnuts (tons)	67,900	61,200	78,000

(Sources: California State Department of Agriculture and U.S. Department of Agriculture.)

Events, 1962.—Political activity remained in the forefront in California during the year. At stake in the November elections were all of the elective offices in the state administration, half of the 40 seats in the state Senate, the 80 seats of the state Assembly, the 38 congressional seats, and 1 U.S. Senate seat. The primary was dominated by the race for the Republican gubernatorial nomination between former Vice President Richard M. Nixon and the conservative Republican minority leader of the Assembly, Joseph C. Shell. (Earlier, former Gov. Goodwin J. Knight had withdrawn from contention because of ill health.) Nixon won the nomination, although Shell received 35% of the Republican vote. In the Republican race for the U.S. Senate nomination, incumbent Thomas H. Kuchel defeated his two right-wing opponents.

For the most part, Democratic incumbents were renominated, and the state senator from Los Angeles County, Richard Richards, was chosen to

run against Senator Kuchel. In the other races which eventually gained national prominence, three avowed members of the John Birch Society won the Republican nomination for Congress. The emergence of Ralph Richardson, Democrat, and Maxwell Rafferty, Republican, as the leading contenders for the nominally nonpartisan post of state superintendent of schools presented two sharply opposed viewpoints concerning the direction which education ought to take in the State of California.

The general election campaign opened with Governor Brown stressing the positive accomplishments of his administration: the Feather River Project, a billion-dollar aqueduct to supply water from the northern Sierras to the dry counties of Southern California; the master plan for higher education; the fair employment law; increased state aid to schools, mental hospitals, and highways; and four straight years of balanced budgets. Nixon sought to counter Brown's campaign by promising more competent administration, greater economy in government, lower taxes, and a better climate for business as a means of meeting California's employment needs.

Toward the end of the campaign, Nixon attacked Brown as a "bumbler," and promised if elected to end welfare chiseling, big-time dope peddling, and administrative inefficiency. Nixon's promise to bar Communists, and persons under indictment for pleading the Fifth Amendment, from University of California campuses brought him into conflict with the Board of Regents, which has autonomous discretion in such matters. Brown accused Nixon of opportunism in seeking the governorship as a steppingstone to the presidency, of ignorance of California affairs, and of "smearing" both Brown and the Democratic Party. Nixon charged the Democrats with a "smear" in discussing a loan made by the Hughes Tool Company to a member of his family when he was vice president.

On November 6, true to form, the second largest turnout (78.4%) of the electorate gave Democrat Brown a 300,000-vote margin (3,037,109 to 2,740,351). Only the traditionally conservative counties of Marin, Orange, Riverside, and San Diego went strongly for Nixon. In a statement following the election, at what he called his "last press conference," Nixon gave utterance to a bitter attack on newsmen whom he accused by implication of being biased against him.

In the other politically significant races, Senator Kuchel was reelected by an overwhelming majority (3,179,727 to 2,455,676); the three Republican congressional candidates of John Birch affiliation were defeated; and Rafferty, a conservative educator, won election as superintendent of schools on a platform of stronger emphasis on intellectual content and the teaching of the American heritage in the public schools. In the congressional races, Democrats won 7 of 8 newly created seats, giving them 25 of the state's 38 congressmen.

Second only to politics in public interest was the improved state of the California economy. In September, as compared with 12 months earlier, employment was up 4.3%, personal income was up 5.1%, and the average weekly earnings of factory employees were up 4.4%. The greatest employment increases occurred in manufacturing (5.6%), service industries (5.3%), and trade (3.2%). The major declines occurred in the motion picture and railroad industries. Unemployment in California as a whole remained slightly above the national average, however.

President Kennedy and Governor Brown took part in groundbreaking ceremonies at Los Banos, August 18, for the San Luis Reservoir, a $433 million federal-state project which is a key unit in California's vast, 20-year program for water conservation and distribution. The earth-fill dam, on completion in 1968, will alleviate the perennial water shortage of the San Joaquin Valley. (See also DAMS.)

In late November, Governor Brown claimed that California had passed New York as the most populous state in the Union. State projections showed that California assumed the lead—at about the 17,300,000 point—on November 24. The U.S. Census Bureau, however, maintained that the change in ranking would come in early 1963.

CAMBODIA

The Kingdom of Cambodia in Southeast Asia is bordered on the north by Laos and Thailand, on the west by Thailand, on the south by the Gulf of Siam, and on the east by Vietnam. It has an area of 66,800 square miles, about the size of the State of Washington, and a population of 5.7 million (1962 census est.), including minorities of 300,000 Chinese, 400,000 Vietnamese, an unknown number of hill tribes and Chams (Cambodian Moslems), and 5,000 Europeans, mainly French. The capital is Phnom Penh (1960 est. pop., 500,000). Cambodian or Khmer is the language used by all Cambodians and many minority groups; Vietnamese and Chinese are used in domestic commerce, and French is the accepted language in government circles.

Government.—The Cambodian Constitution, promulgated on May 6, 1947, provides for a limited monarchy. Executive power is vested in the Council of Ministers (cabinet), responsible to a popularly elected National Assembly (lower house). The Council of the Kingdom (upper house) has limited powers, its members representing professional and regional interests. Cambodia is led by a chief of state, Prince Norodom Sihanouk, who has held the office since June 20, 1960. In the elections of 1955 and 1958, the Sangkum Reastr Niyum (People's Socialist Community), created and controlled by Prince Sihanouk, won all seats in the Assembly. The two chief opposition parties are the Kanapac Pracheathipatay (Democratic Party), founded in 1946, and the Pracheachon (Khmer Communist Party), launched officially in 1955.

For administrative purposes Cambodia is divided into 16 provinces (khet). Phnom Penh is administered by a governor assisted by an appointive municipal commission. Each provincial governor represents the central government and supervises the administration of provincial districts (srok), townships (khum), and villages (phum).

Education and Religion.—School enrollment, 1959–60: 562,165. Number of schools (with enrollments): 3,446 primary (543,450); 31 secondary (16,839); 4 higher (523, excluding the Royal School of Medicine); 4 technical (778); 3 arts (575). The United States, Communist China, and other countries provide assistance in agricultural and teacher-training education. Most Cambodians are Hinayana (Lesser Vehicle) Buddhists. About 82,000 students were enrolled in Buddhist temple schools in 1961.

Finance.—Authorized expenditure, 1961: $140 million; estimated revenues, $108 million. The budget deficit of $32 million was covered by $12 million in United States aid funds and by $20 million in Cambodian treasury reserves. Of total 1961 expenditure, 25.9% was allocated for defense, 15.9% for education, and 14.6% for economic development. The basic currency is the riel; 35 riels equal the United States dollar at the official exchange rate, but the special tourist rate is 60 riels to the dollar. Currency in circulation: 2.7 billion riels in 1961 (2.3 billion in 1959).

Transportation and Communications.—Inland waterways are the chief means for transporting goods within Cambodia. Railways, 240 miles of single-track line; national highways, 2,360 miles; provincial highways, 890 miles. The port of Phnom Penh handled 1.2 million tons of freight in 1960. Air service is provided by Transports Ariens Intercontinentaux Airlines, Air France, Czech Airlines, Royal Air Cambodge, Thai Airways, and Air Vietnam; passenger arrivals (1960), 13,374; departures, 14,711. Registered passenger cars (1961), 11,140; telephone subscribers (1960), 1,757.

Economic Indicators.—Gross national product (1961): $542 million (per capita, $108). Annual rate of economic growth: 5%. Agricultural share of national income: about 50%. Trade as percentage of gross national product: 25%.

Manufactures and Minerals.—Manufacturing consists mainly of processing agricultural products and making handicraft articles. About 100,000 persons are engaged in handicrafts and 6,000 in large-scale modern factories, including an automobile assembly plant, match factory, three cigarette plants, textile spinning and weaving mills, and metal-fabricating plants. Mining activities involve the limited production of building materials, potter's clay, salt, precious stones, and gold (150 kilograms in 1960). Unexploited mineral deposits include limestone, iron ore, phosphate, and coal.

Agriculture.—Rice and rubber account for about 20% of the national revenue. Some 45% of the land is capable of cultivation, but only 9% is under cultivation. Chief products (tons, 1960–61): rice, 1.5 million; rubber, 36,700 (1960); cotton, 7,000; fish (annual catch), 100–150,000; maize, 108,000; tobacco, 5,600; sugar, 56,400. Number of livestock (1960): cattle, 1,200,000; pigs, 550,000; buffalo, 400,000.

Foreign Trade.—Total exports, 1961: 2,220 million riels (down 9% from 1960); imports, 3,395 million (up 5%). Chief exports (in millions of riels, 1960): rubber, 977.9; rice, 811.5; corn, 289.6; timber, 52.6; pepper, 52.3. Chief imports: agricultural products and foods, minerals, textiles, drugs, metal products, and chemical products. Chief customers: France and the franc zone, Hong Kong, Malaya, Great Britain, and the United States. Main suppliers: France and the franc zone, Japan, Hong Kong, and the United States.

Events, 1962.—Cambodia's first five-year plan (1960–64) has surpassed its final goals in cotton production and in some branches of education. Agricultural stations in Battambang showed an eightfold increase in rice production per acre since 1958. Swamps have been converted into gardened boulevards in Phnom Penh. Conference halls, model villages, four-lane highways, infirmaries, and schools of Khmer arts and crafts have been opened.

Cambodia receives aid from 14 countries, mainly the United States, the Soviet Union, and Communist China. United States aid, totaling $24.3 million in 1961, has exceeded the combined assistance of all other countries, and is mainly used for the armed forces and the import program. The Soviet Union has constructed a large hospital where Cambodians receive free medical treatment, and two technical-training centers. Chinese aid has been allocated for four factories, irrigation projects, plant nurseries, rural roads, and small hospitals and schools.

Cambodia's claim to the ruined temple of Preah Vihear on the Cambodian-Thai border was upheld by the International Court of Justice on June 15. Thailand declared it would accept the court's decision and was reported on July 16 to have vacated the temple. (See also INTERNATIONAL LAW.) Cambodia on July 9 rejected a claim by South Vietnam to two small Cambodian islands in the Gulf of Siam.

The United States, in September, was reported to be considering new military aid for Cambodia's 29,000 troops in their struggle with Viet Cong guerrillas infiltrating over the unmarked border from North Vietnam. Orders were given the Cambodian Army to fire on all planes violating the air space from Thailand and South Vietnam. Charges were made that aircraft of these countries had flown into Cambodia 191 times since December 1961.

Chief of State Sihanouk, on August 25, stated that Washington had rejected his plan for a new international conference to guarantee Cambodia's frontiers against incursions by Thailand and South Vietnam. On November 6, he warned that Cambodia would break diplomatic relations with South Vietnam unless alleged border provocations ceased. He later called on Communist China to protect his country from "imperialist threats," and implied that he feared aggression from South Vietnam and Thailand.

CAMEROONS. See CAMEROUN; NIGERIA.

CAMEROUN

The Federal Republic of Cameroun, situated on the west coast of central Africa, comprises two former United Nations trust territories: French-administered Cameroun (now East Cameroun), which became an independent republic on Jan. 1, 1960; and British-administered Southern Cameroons (now West Cameroun), which joined the republic on Oct. 1, 1961. The total area is 183,376 square miles. The population of 4,097,000 (mid-1960 est.) comprises mainly Sudanese and Bantu peoples, and 16,200 French and other nonindigenous persons. French and English are the official languages. Principal cities (with 1961 est. populations): Yaoundé, the capital (58,000); and Douala, the main port (150,000).

Ahmadou Ahidjo, president of Republic of Cameroun, is welcomed to Washington on March 13 by President Kennedy.

UPI

Government.—The new constitution effective as of Oct. 1, 1961, provides for a federal form of government with strong executive powers invested in the office of president. Ahmadou Ahidjo, leader of the ruling Cameroun Union party in East Cameroun, was elected president for a five-year term by the Cameroun National Assembly on May 5, 1960. John N. Foncha, head of the National Democratic Party in West Cameroun and formerly prime minister of Southern Cameroons, has served as federal vice president since Oct. 1, 1961. The Federal National Assembly consists of 50 deputies elected by universal suffrage for five-year terms; 40 deputies are elected from East Cameroun, and 10 from West Cameroun. East Cameroun has its own legislative assembly of 100 members; the legislative assembly in West Cameroun comprises 37 seats, of which 25 were won by the National Democratic Party in elections on Dec. 30, 1961.

Education and Religion.—School attendance reportedly exceeds 90% of the school-age population in the progressive south, but is far lower in the feudal and backward north; in 1959 an estimated 33% of the total school-age population attended school. School enrollment, 1959: primary, 371,421; secondary, 8,721; technical, 4,359; teacher-training, 728. Christians comprise about half the population; Moslems number some 500,000, chiefly among the Hamitic tribes of the north.

Finance.—East Cameroun revenue, fiscal year 1962 est.: 15,995 million francs CFA (15,700 million in fiscal 1961); expenditure, 18,747 million (15,068 million). French assistance, fiscal 1962: 1,885 million francs CFA (246.85 francs CFA equal the U.S. dollar). The franc CFA was made the only legal tender in West Cameroun as of April 2, 1962 (see below, *Events, 1962*).

Transportation and Communications.—A two-line railroad system connects Douala with Yaoundé and with Nkongsamba, and totals 314 miles. Road network: 7,450 miles, including 3,000 miles of all-weather roads and 390 miles of hard-surfaced highways. The port of Douala has an annual traffic capacity of 1,120,000 tons, and an international airport. Passenger cars (1960): 9,800; commercial vehicles, 20,000; telephones, 6,120; radios, 10,000 (1959).

Agriculture.—Principal economic activities are subsistence agriculture, fishing, and livestock raising. Main subsistence crops: millet and sorghum, cassava, corn, yams, rice, bananas, and peanuts (80,000 metric tons produced in 1961–62). Chief cash crops (metric tons exported, 1961): cacao, 58,302; bananas, 51,280; green coffee, 35,484; palm kernels, 14,564; cotton, 10,395; and peanuts (shelled), 9,924.

Manufactures and Minerals.—Principal manufactures: vegetable oils and products, cotton fiber and clothing, rubber, plastic sandals, soap, beer, wood products, and

UPI

Governor General Georges Vanier opens the Canadian Parliament on September 27 by reading the Throne Speech. Seated at left is Prime Minister John Diefenbaker; at right is Mrs. Vanier. Senators and Supreme Court Justices are in foreground.

timber (170,075 metric tons exported in 1961). Chief mineral (metric tons exported, 1961): aluminum, 46,144.

Foreign Trade.—Total exports, 1961: 24,177 million francs CFA (up 1% from 1960); imports, 23,687 million (up 14%). Chief exports (in million francs CFA, 1961): cacao, 6,254; green coffee, 5,121; aluminum, 4,798; timber, 1,745; cotton fiber, 1,447. Principal imports: foodstuffs, metal products, machinery, petroleum products, and textiles. In 1961, France took 59% of Cameroun's exports and provided 54% of imports.

Events, 1962.—East and West Cameroun took further steps in 1962 to secure integration of their regional economies. As of April 2, Nigerian currency which had been legal tender in West Cameroun was withdrawn and replaced by the franc CFA as the only legal currency in the federal republic. The import licensing programs of both regions were also integrated on that date.

President Ahmadou Ahidjo paid a five-day state visit to the United States in mid-March. He conferred (March 13–14) in Washington with President Kennedy on African problems, and discussed ways by which the United States could assist the economic development of his country.

Charles Okala, former foreign minister, and three other leaders of opposition parties rejected, on June 23, President Ahidjo's proposal for a united political party because, they declared, such a development would lead to a "fascist-type dictatorship." They were subsequently arrested and charged with "inciting hatred against the government."

Douala was the scene of a tragic airplane accident on March 4. A chartered British airliner carrying 101 passengers and 10 crewmen crashed into a jungle swamp shortly after taking off from the Douala airport. All 111 persons aboard were killed. The DC-7C aircraft had flown to Cameroun from southern Africa, and was en route to Europe.

W. R. F.

CANADA

Canada is the second largest in area of the countries of the world, and is a sovereign state of the Commonwealth of Nations. The nation is a federal union of 10 provinces, the Northwest Territories, and the Yukon Territory. The capital of Canada is Ottawa, in the Province of Ontario.

Area and Population.—Canada's total area of over 3.8 million square miles is second only to that of the Soviet Union. The census population of June 1, 1961, was 18,238,247, representing an increase of 2,157,456 or 13.4% since the census of 1956; estimated population (Oct. 1, 1962), 18,683,000. According to the 1961 census, 69.6% of the total population lived in urban areas (66.6% in 1956), and 11.3% of the population lived on farms (17.1% in 1956). The census reported that English was the only language spoken by 67.4% of the population; French, by 19.1%; both English and French, by 12.2%; and other languages, by 1.3%.

Principal Canadian cities and their populations (final 1961 census): Montreal, 1,191,062 (metropolitan area, 2,109,509); Toronto, 672,407 (metropolitan area, 1,824,481); Vancouver, 384,522; Edmonton, 281,027; Hamilton, 273,991; Ottawa, 268,206; Winnipeg, 265,429; and Calgary, 249,641.

Table 1—AREA AND POPULATION OF CANADIAN PROVINCES AND TERRITORIES

Province or territory	Area (sq. mi.)	Population 1961 census	Population Oct. 1, 1962 estimate
Newfoundland*	156,185	457,853	474,000
Prince Edward Island	2,184	104,629	106,000
Nova Scotia	21,425	737,007	750,000
New Brunswick	28,354	597,936	608,000
Quebec	594,860	5,259,211	5,405,000
Ontario	412,582	6,236,092	6,377,000
Manitoba	251,000	921,686	940,000
Saskatchewan	251,700	925,181	931,000
Alberta	255,285	1,331,944	1,383,000
British Columbia	366,255	1,629,082	1,670,000

Northwest Territories	1,304,903	22,998	24,000
Total, Canada	3,851,809	18,238,247	18,683,000

*Including Labrador. (Source: Dominion Bureau of Statistics.)

Vital Statistics.—The Canadian birth rate, relatively high for an industrialized country, fell to 26.1 in 1961 (from 26.9 in 1960), the lowest since 1945. The death rate, one of the lowest in the world, was 7.7 in 1961 (7.8 in 1960), and the infant mortality rate remained at a record low of 27 per 1,000 live births.

National Derivation.—The native-born population comprised 84.4% of the total in 1961 (85.3% in 1951). In 1961, Canadians of British descent made up 43.8% of the population, French, 30.4%; other European, 21.8%; Indians and Eskimos, 1.2%; and Asian, 0.7%.

Immigration.—Immigrants entering Canada in 1961 numbered 71,689, down 31% from 1960 and the lowest total since 1947. Immigration is chiefly from Italy, the United Kingdom, and the United States. Citizenship certificates in 1961 were granted to 56,476 persons (down 9% from 1960).

Religion.—Adherents of religious denominations, according to percentage of total population in 1961, are: Roman Catholic, 45.7%; United Church of Canada, 20.1%; Church of England, 13.2%; Presbyterian, 4.5%; Lutheran, 3.6%; Baptist, 3.3%; Jewish, 1.4%; Greek Orthodox, 1.3%; Ukrainian (Greek) Catholic, 1.0%; Mennonite, 0.8%; Pentecostal, 0.8%; and other, 4.2%.

Government and Social Welfare

Government.—Canada is a self-governing, independent nation, whose sovereign is Queen Elizabeth II. The Canadian government is administered by a prime minister and a cabinet of departmental ministers who are members of the Parliament at Ottawa. The ministry is responsible to the lower house, or House of Commons, and holds office as long as it retains the confidence of that body.

Governor General.—Executive power is nominally vested in a governor general appointed by the British crown on the advice of the Canadian cabinet, usually for a term of five years. The governor general, representing the sovereign, acts under the advice of the Canadian ministry. Maj. Gen. George P. Vanier was installed as governor general on Sept. 15, 1959

Judiciary.—The Supreme Court of Canada, composed of a chief justice and eight puisne judges, is the final court of appeal in both civil and criminal cases throughout Canada. Patrick Kerwin was appointed chief justice on July 1, 1954.

Parliament.—The Canadian Parliament consists of a House of Commons and a Senate. The influence of the Senate on legislation is considerably less than that of the House of Commons, in which most public bills are introduced.

The Senate, or upper house, consists of 102 members appointed for life by the governor general on the advice of the ministry. It is composed of 24 senators from Ontario, 24 from Quebec, 10 from Nova Scotia, 10 from New Brunswick, 6 each from Newfoundland, Manitoba, Saskatchewan, Alberta, and British Columbia, and 4 from Prince Edward Island.

The House of Commons consists of 265 members elected for a five-year term, or less, if Parliament is earlier dissolved. As a result of the elections of June 18, 1962, party seating in the House of Commons was as follows (with previous number of seats held in parentheses): Progressive Conservatives, 116 (208); Liberals, 99 (49); Social Credit, 30 (0); New Democratic Party (formed in 1961, previously the Co-operative Commonwealth Federation), 19.

Ministry.—John G. Diefenbaker (q.v.) took office as prime minister of a Conservative government on June 21, 1957; the other ministers, in order of precedence as of Jan. 1, 1963, were as follows:

Howard Charles Green (q.v.), secretary of state for external affairs.

Donald Methuen Fleming (q.v.), minister of justice and attorney general.

George Harris Hees, minister of trade and commerce (appointed 1960): b. Toronto, Ont., June 17, 1910; first elected to the House of Commons for Toronto-Broadview in 1950; served as minister of transport, 1957–60.

Léon Balcer, minister of transport (appointed 1960): b. Trois-Rivières, Que., Oct. 13, 1917; first elected to the House of Commons for Trois-Rivières in 1949; served as solicitor general, 1957–60.

Gordon Churchill, minister of veterans affairs (appointed 1960): b. Coldwater, Ont., Nov. 8, 1898; first elected to the House of Commons for Winnipeg South-Centre (Man.) in 1951; served as minister of trade and commerce, 1957–60.

Edmund Davie Fulton, minister of public works (appointed 1962): b. Kamloops, B.C., March 10, 1916; first elected to the House of Commons for Kamloops in 1945; served as minister of justice and attorney general, 1957–62.

George Clyde Nowlan, minister of finance and receiver general (appointed 1962): b. Havelock, N.S., Aug. 14, 1898; first elected to the House of Commons for Digby-Annapolis-Kings (N.S.) in 1948; served as minister of national revenue, 1957–62.

Douglas Scott Harkness, minister of national defense (appointed 1960): b. Toronto, Ont., March 28, 1903; first elected to the House of Commons for Calgary East (Alta.) in 1945 (re-elected for Calgary North in 1953); served as minister of agriculture, 1957–60.

Ellen Louks Fairclough, postmaster general (appointed 1962): b. Hamilton, Ont., Jan. 28, 1905; first elected to the House of Commons for Hamilton West in 1950; served as secretary of state, 1957–58, and minister of citizenship and immigration, 1958–62.

John Angus MacLean, minister of fisheries (appointed 1957): b. Lewis, Beaton's Mills, P.E.I., May 15, 1914; first elected to the House of Commons for Queens (P.E.I.) in 1951.

Michael Starr, minister of labor (appointed 1957): b. Cooper Cliff, Ont., Nov. 14, 1910; first elected to the House of Commons for Ontario in 1952.

William Joseph Browne, solicitor general (appointed 1960): b. St. John's, Nfld., May 3, 1897; first elected to the House of Commons for St. John's West in 1949 (defeated 1953); re-elected in 1957; served as minister without portfolio, 1957–60.

Jay Waldo Monteith, minister of national health and welfare (appointed 1957): b. Stratford, Ont., June 24, 1903; first elected to the House of Commons for Perth (Ont.) in 1953.

Francis Alvin George Hamilton, minister of agriculture (appointed 1960): b. Kenora, Ont., March 30, 1912; first elected to the House of Commons for Qu'Appelle (Sask.) in 1957; served as minister of northern affairs and national resources, 1957–60.

Raymond Joseph Michael O'Hurley, minister of defense production (appointed 1958): b. St. Gilles, Que., Oct. 1, 1909; first elected to the House of Commons for Lotbinière (Que.) in 1957.

Joseph Pierre Albert Sévigny, associate minister of national defense (appointed 1959): b. Quebec, Que., Sept. 12, 1917; first elected to the House of Commons for Longueuil (Que.) in 1958.

Hugh John Flemming, minister of forestry (appointed 1960) and minister of national revenue (appointed 1962): b. Peel, N.B., Jan. 5, 1899; first elected to the House of Commons for Royal (N.B.) in 1960.

Walter Gilbert Dinsdale, minister of northern affairs and national resources (appointed 1960): b. Brandon, Man., April 3, 1916; first elected to the House of Commons for Brandon in 1951; re-elected for Brandon-Souris in 1953.

George Ernest Halpenny, secretary of state (appointed 1962): b. Plantaganet, Ont., June 14, 1903; first elected to the House of Commons for London (Ont.) in 1957; served as minister without portfolio, 1960–62.

Paul Martineau, minister of mines and technical surveys (appointed 1962): b. Bryson, Que., April 10, 1921; first elected to the House of Commons for Pontiac-Témiscamique (Que.) in 1958.

Richard Albert Bell, minister of citizenship and immigration (appointed 1962): b. Britannia Heights, Ont., Sept. 4, 1913; first elected to the House of Commons for Carleton (Ont.) in 1957.

Malcolm Wallace McCutcheon, minister without portfolio (appointed 1962): b. London, Ont., May 18, 1906; appointed to the Senate in August 1962.

Provincial Government.—Each of Canada's 10 provinces has a lieutenant-governor appointed by the governor general of Canada, its own premier and executive council or cabinet, and a popularly elected unicameral Legislative Assembly (Quebec alone retains an appointive Legislative Council in addition to its Legislative Assembly). The Northwest Territories and the Yukon Territory are under the jurisdiction of the federal government.

Finance.[1]—The federal government on May 2, 1962, announced the establishment of a fixed par value for the Canadian dollar equivalent to U.S.$0.925 (previously the exchange rate for the Canadian dollar varied widely). Federal budgetary revenue for the fiscal year ended March 31, 1962, totaled $5,729.6 million ($5,617.7 million in fiscal year 1961); expenditure, $6,520.6 million ($5,958.1 million). Chief sources of revenue in the 1962 fiscal year were (in millions): personal income tax, $1,792.7; corporate income tax, $1,202.1; excise (including sales) taxes, $1,022.2; and customs import duties, $534.5. Expenditure for national defense and defense production totaled $1,650.0 million. Other major expenditure items were (in millions): public debt charges, $838.9; subsidies and tax-sharing payments to provinces, $541.2; family allowances, $520.8; transport, $410.4; and veterans affairs, $333.2. The net public debt as of March 31, 1962, totaled $13,228.1 million (up $791 million from a year earlier).

The federal budget for the fiscal year 1963, presented to Parliament on April 10, 1962, forecast revenue at $5,780 million, and expenditure at $6,525 million, for an anticipated deficit of $745 million. It was announced on Oct. 18, 1962, that current expenditure would be reduced by $227.9 million from the official estimate in order to reduce the budget deficit. Estimated revenues of the provincial governments for the fiscal year 1963 totaled $3,095 million (up 9.8% from the fiscal year 1962); estimated expenditures, $3,480 million (up 12.7%).

Defense.—Canada's active armed forces comprised 120,055 men and women as of March 31, 1961. Personnel was divided as follows (with reserves shown in parentheses): Canadian Army, 48,051 (militia, 43,229); Royal Canadian Navy, 20,655 (3,672); and Royal Canadian Air Force, 51,349 (3,130).

[1] All monetary figures used in this article are in Canadian dollars.

Social Welfare.—The federal government pays a pension of $65 per month (increased from $55 per month as of Feb. 1, 1962) to persons aged 70 and over who have lived in Canada at least 10 years. In the fiscal year 1962, old-age pension payments totaled $625 million, to more than 800,000 persons. Under the family allowance program, the federal government pays $6 per month for children under 10 years and $8 for children aged 10–15; payments in fiscal 1962 totaled an estimated $520.9 million. Federal contributions toward programs administered by the provinces for aid to the needy aged (65–69 years), blind, and disabled in fiscal 1962 totaled $50.9 million (old-age assistance, $30.7 million; disabled, $16.2 million; blind, $4.1 million). The federal government also administers the nation's unemployment insurance program and contributes one fifth of total employer-employee contributions. Other federal programs include veterans benefits, grants to provincial and municipal health and rehabilitation programs, grants to provinces for unemployment assistance, and aid to Indians and Eskimos. (See also CHILDREN AND YOUTH; MARRIAGE AND DIVORCE; STANDARDS OF LIVING.)

Education.—The provinces control education in Canada, but the federal government provides grants for vocational education, higher education, and research, and operates Indian schools and schools in the Northwest Territories. School attendance is generally compulsory for children aged 7–15, with minor age variations in certain provinces. School enrollment of students aged 5 to 19 years totaled 3,968,000 in 1960 (77% of the school-age population). In the 1960–61 academic year, teachers in public elementary and secondary schools numbered 159,282 (7.2% over 1959–60), of whom 28.3% were men; the median salary (excluding Quebec) was $4,247, a rise of 4.7% from 1959–60. Educational expenditures in 1961 totaled an estimated $1.75 billion. Canada's largest universities and enrollments as of Dec. 1, 1961 (including enrollment at affiliated institutions) were: Université de Montreal, 17,762; University of Toronto, 14,518; University of British Columbia, 14,357; Université Laval, 10,984; McGill University, 8,528; and University of Alberta, 8,200.

Table 2—CANADIAN EDUCATION STATISTICS
(Data for 1960–61)

Type of School	Schools	Teachers	Pupils
Elementary and secondary education:			
Public and separate schools	25,604	151,407	3,993,125
National Defence (overseas)	21	379	7,274
Indian schools[1]	464	1,306	32,643
Schools for the blind	6	98	714
Schools for the deaf	10	263	1,980
Private schools	1,114	8,743	167,804
Higher education:

Trade courses (pre-employment)	...	...	18,020
Trade courses (apprentices)[3]	...	...	13,858
Vocational high school courses	...	...	115,479
Postsecondary courses	...	...	9,441
Private business schools	...	...	19,150[4]
Adult education (part-time):			
Enrollment	...	...	664,046[5]

[1] Day, residential, and hospital schools administered by the federal government. [2] Also included with "Higher education." [3] Includes indentured apprentices taking full-time, part-time, and correspondence courses. [4] Estimate. [5] Includes enrollment in courses sponsored by federal government departments, public libraries, business colleges, and teacher-training institutions. (Source: *Canada Year Book 1962.*)

Libraries.—Public library service is provided mainly by the municipalities. Public libraries in urban centers numbered 171 in 1960 (148 in 1959), and in rural centers, 627 (831). They served 12,901,107 persons in 1960. The book stock totaled 13,866,935 volumes, and circulation aggregated 56,187,325. (See also LIBRARIES.)

THE CANADIAN ECONOMY

The Canadian economy in 1962 registered sharp gains in most sectors over the previous year. The economic recovery begun in late 1961 was continued in early 1962; the seasonally adjusted gross national product was estimated at a record annual rate of $38.6 billion for the first quarter of 1962. The government's currency devaluation in May stimulated domestic production; and high consumer spending, caused in part by an increase in prices, was a key factor in economic expansion. Manufacturing increases were led by the 10% gain in steel output, which reflected the large increase in automobile production. Planned capital spending in the first half of the year rose by 2%, and expenditures for housing construction were up 4.5%.

Canadian foreign trade in the first three quarters of 1962 was up about 10% over the comparable period of 1961. Agriculture recovered from the severe drought of 1961 and registered marked gains in the output of grains and most other crops in 1962 as the result of favorable weather conditions. The bumper wheat crop was estimated at 551.4 million bushels in 1962, or nearly double the 1961 estimate because of much higher acreage yields. The unemployment situation also was improved; the labor force in October 1962 numbered 6,326,000, up by 71,000 from a year earlier, and unemployed workers constituted only 4.3% of the labor force in the same month, as compared with 4.9% in October 1961.

National Income and Product.—The slowdown in economic activity that had characterized the year 1960 was reversed by the upward trend of consumer demand in 1961. Gross national product was estimated at $36.8 billion in 1961, a rise of 2.5% in dollar terms and 2% in physical volume over 1960. The economic upswing was

Table 3—CANADIAN NATIONAL PRODUCT AND EXPENDITURE[1]
(In millions of current dollars)

Item	1959	1960	1961
Gross National Product			
Wages, salaries, and supplementary labor income	$17,463	$18,119	$18,884
Military pay and allowances	596	509	550
Corporation profits before taxes and before dividends paid to nonresidents	3,498	3,277	3,438
Deduct: dividends paid to nonresidents	−501	−470	−588
Rent, interest, and miscellaneous investment income	2,281	2,390	2,529
Accrued net income of farm operators from farm production	1,118	1,194	937
Net income of nonfarm unincorporated business	2,192	2,190	2,249
Inventory valuation adjustment	−130	−55	−86
Net national income at factor cost	$26,417	$27,154	$27,913
Indirect taxes less subsidies	4,251	4,446	4,643
Capital consumption allowances and misc. valuation adjustments	4,159	4,293	4,349
Gross national product at market prices[2]	$34,784	$35,928	$36,844
Gross National Expenditure			
Personal expenditure on consumer goods and services	$22,495	$23,367	$24,253
Government expenditure on goods and services	6,449	6,683	7,183
Business gross fixed capital formation:			
New residential construction	1,734	1,443	1,458
New nonresidential construction	2,589	2,577	2,647
New machinery and equipment	2,571	2,672	2,388
Value of change in inventories	−350	−359	−238
Exports of goods and services	6,683	7,022	7,578
Deduct: imports of goods and services	−8,131	−8,160	−8,487
Residual error of estimate	−44	−35	62
Gross national expenditure at market prices	$34,784	$35,928	$36,844

[1] All figures are subject to revision. [2] Includes residual error of estimate. (Source: Dominion Bureau of Statistics.)

spurred by increases in exports, business inventories, and capital investments during the latter half of 1961. After a weak first quarter, consumer expenditures rose moderately, particularly in the durable goods sector. Increased government outlays for new goods and services contributed to the rise in economic activity. However, a poor grain harvest in western Canada marred the generally favorable economic picture by causing an estimated reduction of 1% in the total gross national product.

The principal contributor to the 2% increase in national output during 1961 was again the service-producing industries. The construction industry ended a three-year decline as output rose slightly. Manufacturing production, featured by a 3.5% rise in nondurables and a 0.5% decline in durables, was up 2% from the previous year.

Personal income in 1961 totaled $28 billion (up 3.2% from 1960). The consumer price index (1949 = 100) registered 129.2 in 1961 (128.0 in 1960).

Manufacturing.—Manufactures contribute about one fourth of the value of all goods and services produced in Canada and employ an equal proportion of the labor force. The gross value of factory shipments in 1961 was estimated at $23,933 million, up 2.6% from $23,327 million in 1960. Leading manufacturing industries and 1960 output values (in millions of dollars) were: pulp and paper, $1,578; nonferrous metals smelting and refining, $1,495; petroleum refining, $1,175; and motor vehicles, $970.

In 1961, the volume index of manufacturing production (1949 = 100) rose to 153.0, as compared with 149.3 in 1960. The rise was featured by increases in output of durable and nondurable manufactures. Among important durables, steel ingot output totaled 6,356,400 tons in 1961 (up 11% from 1960); and pig iron, 4,924,800 (up 15%). Production of motor vehicles amounted to 390,731 units (including 327,897 passenger cars), a decline of 1.4% from 1961. (See also ALUMINUM; IRON AND STEEL; TEXTILE INDUSTRY.)

Building and Construction.—The total value of construction in 1961 was estimated at $7 billion, up 2.2% from 1960. New construction totaled $5,573 million; repair construction, $1,466 million. Building construction, which increased slightly in value to $4,085 million, was featured by a substantial increase in residential construction. Housing starts numbered 125,577 units (up 15.4% from 1960); completions, 115,608 (down 6%). Engineering construction in 1961 was valued at $2,954 million, which included substantial increases in outlays for dams and reservoirs, electric power plants, and gas and oil facilities.

Retail Sales.—Retail sales in 1961 totaled $16,663 million, representing an increase of nearly 1% over 1960. Sales of the leading trades in 1961 (in millions): food and beverage stores, $4,806; motor vehicle dealers, $2,519; department stores, $1,500; clothing stores, $779; hardware and lumber, $761; furniture and appliances, $556.

Labor.—The civilian labor force in 1961 averaged 6,518,000, including 691,000 agricultural and 5,827,000 nonagricultural workers. Of the total labor force, an average of 469,000 (7.2%) were without jobs and seeking work (448,000 and 7.0% in 1960). Average hourly earnings of hourly-rated wage earners in manufacturing were $1.83 in 1961 (up 2.8% from 1960); average weekly wages, $74.27 (up 3.2%); and the average workweek, 40.6 hours (40.4 in 1960). Time lost in labor disputes totaled 1,335,100 man-working days, or nearly double that in 1960. Membership in trade unions in 1960 approximated 1,447,000. Women workers numbered 1,653,000, or about 26% of the labor force.

Corporate Profits.—Corporate profits before taxes totaled $3,438 million in 1961, an increase of 4.9% over 1960. Dividends paid to nonresidents amounted to $588 million in 1961. The 1961 increase in profits was most marked in the food and beverage, wood and paper products, and mining industries, but all industries registered gains with the exception of the iron and steel industry, whose profits declined slightly.

Banking.—The government's fiscal agent is the Bank of Canada, which is owned by the federal government and performs central banking functions. Canada's 8 privately owned chartered banks had 5,201 branch offices at the end of 1960. Total Canadian dollar deposits of chartered banks amounted to $14,244 million as of June 30, 1962 (up about 11% from a year earlier), including $7,993 million in personal savings deposits (up 5%). (See also BANKING.)

Agriculture.—Canadian agricultural productivity has increased greatly in the past two decades. In 1940 a worker in Canadian agriculture supplied, on the average, sufficient food for himself and nine other persons; in 1960 he produced enough for himself and 22 others. From 1956 to 1961 the number of farms declined by 16% to 480,903. The average size of farms increased from 302.5 acres in 1956 to 359 acres in 1961, and farm area totaled 172.5 million acres (173.9 million in 1956), of which 62.4 million acres were under crops.

Farm Income.—Farm cash income from the sale of farm products and from government payments under the Prairie Farm Assistance Act and other programs totaled a record $2,964.6 million in 1961 (prelim.), up 3.7% from 1960. Income from wheat totaled $607 million in 1961; livestock and livestock products, $1,285 million; dairy products, $534 million; and fruit, $54 million. Realized net income from farming operations in 1961 totaled $1,341 million, or nearly 3% above revised figures for 1960 and 4.5% over the 1956–60 yearly average.

Farm Output.—Canadian crop production for 1961 and 1962 are shown in the accompanying table. Output of grains in 1962 was markedly above that of the poor 1961 crop year. In the crop year ended Sept. 30, 1961, output of tobacco totaled 209.7 million pounds (green weight), down slightly from the record 214.2 million in the 1960 crop year. The 1961 apple crop amounted to 16,206,000 bushels, up 8.7% from 1960. Milk production totaled 19.1 billion pounds (prelim.) in 1961 (up 3.9%); and eggs, 447 million dozen (down 1%). Number of livestock, as of June 1, 1961: cattle, 11,941,184; pigs, 5,332,736; sheep, 1,563,534; horses, 512,021; and goats, 23,492.

Table 4—ACREAGE AND PRODUCTION OF PRINCIPAL FIELD CROPS[1]

(Figures in thousands)

Crop and unit of measurement	Acreage		Production	
	1961	1962[2]	1961	1962[2]
Wheat (bushels)	25,316	26,893	283,394	557,554
Oats for grain (bushels)	8,543	10,591	283,965	493,610
Barley (bushels)	5,529	5,287	112,640	165,888
Rye (bushels)	561	667	6,519	12,644
Flaxseed (bushels)	2,075	1,415	14,318	15,685
Mixed grains (bushels)	1,566	1,522	61,310	72,186
Corn for grain (bushels)	400	421	29,208	32,025
Buckwheat (bushels)	58	45	1,217	1,122
Peas, dry (bushels)	66	50	1,040	827
Beans, dry (bushels)	65	65	1,325	1,423
Soybeans (bushels)	212	221	6,631	6,608
Potatoes (hundredweights)	304	284	44,031	44,742
Mustard seed (pounds)	121	121	37,500	72,900
Rapeseed (pounds)	710	404	561,000	318,000

Tame hay (tons)	12,229	12,370	20,813	22,536
Fodder corn (tons)	360	367	4,054	4,409
Field roots (tons)	27	26	288	282
Sugar beets (tons)	85	85	1,106	1,079

[1] Not including Newfoundland, for which data are not available
[2] November estimate. (Source: Dominion Bureau of Statistics.)

Mineral Production.—Canada produces more nickel and asbestos than any other nation, and is a leading producer of zinc, uranium, gold, silver, platinum metals, and other minerals. Canadian mineral production in 1961 was valued at a record $2,573.8 million, or 3.2% above the $2,492.5 million in 1960. The leading mineral producer among the provinces was Ontario, which supplied 36.7% of the total 1961 value; Alberta provided 18.0%; Quebec, 17.5%; and Saskatchewan, 8.5%. (See also IRON AND STEEL.)

Table 5—CANADA'S LEADING MINERALS

(Figures are in thousands; data for 1961 are preliminary.)

Mineral and unit of production	1960		1961	
	Quantity	Value	Quantity	Value
Asbestos (tons)	1,118	$121,400	1,171	$131,053
Cement (tons)	5,787	93,261	6,145	100,692
Clay products	...	38,226	...	38,045
Coal (tons)	11,011	74,676	10,367	69,983
Copper (pounds)	878,524	264,847	889,271	258,582
Gold (troy ounces)	4,629	157,151	4,425	156,851
Iron ore (tons)	21,551	175,082	20,383	180,457
Lead (pounds)	411,300	43,927	462,394	47,395
Natural gas (million cubic feet)	522,972	52,197	646,018	63,607
Nickel (pounds)	429,013	295,640	475,896	357,515
Petroleum (billion barrels)	189,534	422,926	220,460	487,305
Sand and gravel (tons)	192,074	111,164	178,502	106,413
Silver (troy ounces)	34,017	30,244	31,981	30,069
Stone (tons)	45,359	60,641	45,315	60,666
Uranium oxide (pounds)	25,495	269,938	19,645	204,138
Zinc (pounds)	813,745	108,635	824,727	103,782

Forestry.—Forests occupy nearly half of Canada's total land area. About 715,000 square miles of forest land are accessible for commercial operations, and provide the material for some of the nation's leading industries. Forest production in 1960 totaled 3,405.4 million cubic feet of wood, a rise of 6.9% over 1959; value of output was $806,488,000, up 12.7%. Production of leading primary forest products in 1960 was (in millions of cubic feet): logs and bolts for sawing, 1,728.0; logs for pulping, 196.6; pulpwood, 1,189.3; and fuelwood, 240.3. British Columbia led the provinces in primary forest production, with a 1960 output value of $304,978,000; Quebec, $212,620,000; and Ontario, $154,474,000. (See also FORESTRY; LUMBER.)

Fisheries.—In 1961, landings of sea fish totaled 1,856.7 million pounds (up 11% from 1960) and were valued at $96,841,000 (up 8%). Atlantic coast landings, mainly lobster, cod, and haddock, had a value of $58.8 million; the Pacific catch, chiefly salmon, herring, and halibut, $38.0 million. The overall increase in 1961 was due to much greater catches of salmon and herring off the Pacific coast.

Furs.—Wildlife pelts taken in the 1960–61 season numbered 5,019,260 (up about 2% from 1959–60), with a value of $11,702,725 (down 5%). Fur farms numbered 2,331 in 1960, and 1,219,031 pelts were taken from ranch-raised animals. Mink, fox, and chinchilla pelts taken on fur farms had a value of $17,027,197, of which mink accounted for $16,888,441.

Hydroelectric Power.—Canada is second only to the United States in hydroelectric power installation. Canada's capacity turbine installation totaled 26,688,094 hp. at the end of 1961, with net new capacity added during the year amounting to 294,650 hp. Electrical energy generated from water power totaled 103,668 million kw.-hr. (down about 2% from 1960).

Foreign Trade.—Canada's total foreign trade in 1961 was up 7.2% from the previous record attained in 1960. Exports (excluding re-exports) totaled $5,755.5 million, or 9.5% over the $5,255.6 million of 1960. Imports amounted to $5,771.0 million, or 5.5% above the 1960 total of $5,482.7 million. Export gains in 1961 were registered in many products, notably wheat, petroleum, nonfarm machinery, nickel, newsprint, lumber, wood pulp, fish products, and aircraft and parts; decreases occurred in exports of aluminum, copper, uranium, iron ore, farm machinery, rolling mill products, and wheat flour. Increases in value of imports were registered by most major commodities, principally nonfarm machinery, automobile parts, crude petroleum, electrical apparatus, and farm implements and machinery; declines occurred in imports of automobiles and rolling-mill products. For the first 9 months of 1962, Canadian exports totaled a record $4,623.1 million (up 9.1% from the comparable period of 1961); imports were valued at $4,708.4 million (up 12.8%).

Canada's geographical pattern of trade in 1961 was featured by increased exports to the United States, Canada's leading trading partner, and to Communist China, Japan, and West Germany. The increases were somewhat offset by a decline in exports to the United Kingdom and other Commonwealth countries. The pattern of imports in 1961 was largely unchanged from the previous year. (See also INTERNATIONAL TRADE.)

Transportation and Communications.—Expenditure on Canadian highways and rural roads in the 5-year period ended March 31, 1961, totaled $3.8 billion, including $2.6 billion for new construction and major reconstruction work. As a result of this intensive program, surfaced mileage of Canadian highways increased from 209,328 miles in 1956 to 275,897 miles in 1960. Of the total, paved and bituminous surfaced mileage was 50,617 (up 36.8%). Registered motor vehicles in 1961 totaled 5,517,023 (up 5% from 1960), including 4,325,682 passenger cars.

The 4,860-mile Trans-Canada highway was officially opened on Sept. 3, 1962. The cross-country highway was constructed over a 12-year period and cost an estimated $700 million.

Railroads.—Canada ranks third among the nations of the world in total railroad mileage. First main or single track mileage in operation at the end of 1961 totaled 43,689 miles. The two major systems are the government-owned Canadian National Railways, which operated 24,854 miles of track in 1961, and the Canadian Pacific Railway, which operated 17,033 miles. All Canadian railways in 1961 carried 18.7 million passengers (down 3.7% from 1960) and 153 million tons of revenue freight (down 3.4%).

Commercial Aviation.—The two chief scheduled operators are the Trans-Canada Air Lines and the Canadian Pacific Air Lines. Revenue passengers carried by Canadian air carriers in 1961 totaled 4,950,897 (up 4.7% from 1960); revenue freight, 228,077,376 pounds (down 4.2%). (See also AERONAUTICS.)

Shipping.—The aggregate number of vessels on the Canadian shipping registry at the end of 1960 was 20,381, with a gross tonnage of 1,903,300. Canadian vessels transported 37.4 million tons of cargo through Canadian canals in 1961; vessel transits through the St. Lawrence Seaway numbered 2,328 in the same year. The volume of freight handled at Canadian ports in 1961 rose by 7.8% to 184,711,700 tons (92,916,200 in foreign and 91,795,500 in coastwise service).

Communications.—In 1960, about 83% of all households had telephones, and the total number of telephones was 5,728,167 (up 5.3% from 1959). Over 90% of Canadian homes had television sets in 1961, and 98% had radios. In 1961 there were 21 Canadian Broadcasting Corporation and 78 privately owned television transmitters in operation, and 36 CBC and 196 privately owned radio stations. Daily newspapers in 1960 numbered 113 (91 in English and 12 in French), with a total circulation exceeding 4 million. Post offices in operation in 1960 numbered 11,421. (See also MAGAZINES; NEWSPAPERS; RADIO AND TELEVISION.)

W. R. F.

THE YEAR 1962 IN CANADA

Canada in 1962 enjoyed a continuation of the general prosperity which has been her lot since the end of World War II. Yet the general election in June revealed that Canadian voters felt a confusion and uneasiness about their political leadership which led to their refusing a majority support to any party. Coinciding in time with the election was a crisis in the country's foreign exchange position which compelled drastic action by the government, but which disappeared with astonishing rapidity. The reasons for the exchange crisis, as well as its disappearance and general significance, apparently remained incomprehensible to most Canadians. The Cuban crisis in October left Canadians with the feeling that they had not measured up to their best. At the end of the year, with a minority government in office, Canadians expected to have another general election sometime in the new year. There were few signs, however, that the electorate was any clearer in its mind about national issues than it had been when it voted on June 18, 1962.

Queen Mother Elizabeth, on a 10-day visit to Canada, chats with choir members after Montreal church services, June 10.

UPI

Federal Political Developments.—The last session of the 24th Parliament of Canada opened on January 18 and closed on April 21 with a dissolution after the government's announcement that a general election would be held on June 18. It was a pre-election session in the worst sense of the term, all three parties (Conservative, Liberal, and Co-operative Commonwealth Federation) being chiefly intent on an election campaign rather than on a legislative program. Although the government had an overwhelming majority, Prime Minister John G. Diefenbaker (q.v.) eventually announced the dissolution on the ground that opposition obstruction was preventing the House of Commons from getting on with business. The main achievement was an increase in the old-age pension to $65 a month.

On April 10 the minister of finance, Donald M. Fleming (q.v.), introduced his annual budget. His speech was a review of the benefits which the government had bestowed upon individuals, provinces, and regional groups since 1957, but it contained few new provisions. His survey of economic conditions was optimistic, and he forecast an increase of 7% in the gross national product for the fiscal year. He estimated a budget deficit of $745 million, the sixth successive deficit under the Conservative government.

In the election campaign, Canadian newspapers reported that Prime Minister Diefenbaker did not appear so effective a campaigner as in the past. The Liberals were much better organized and financed than in 1958, and the New Democratic Party was expected to do well under its vigorous new leader, T. C. Douglas, former premier of Saskatchewan. The election results were a spectacular upset and indicated some new trends in Canadian politics.

The Conservative Party, which in 1958 had won 54% of the votes and had amassed a record 208 seats in the House of Commons, received only 37.31% of the votes and 116 House seats in 1962. The Liberals, the main opposition party, obtained 37.36% of the votes and 100 seats. The New Democratic Party won 13.48% of the votes and 19 seats, although its leader and all of its other candidates in Saskatchewan were defeated. (T. C. Douglas later obtained a seat in the House from British Columbia.) Social Credit, owing to its unexpected success in some of the rural areas of Quebec, collected 11.66% of the votes and 30 seats. Only four of the party's seats were obtained in Alberta and British Columbia, both of which were governed by Social Credit ministries.

The Conservatives lost the hold which they apparently had won in Quebec in 1958, and with it all hope of forming a government which would represent all ethnic groups. Under the flamboyant leadership of Real Caouette, Social Credit made an effective appeal in the more backward rural areas of northern and eastern Quebec, and thereby defeated the hopes of the Liberals that the French province would once again attach itself to the Liberal Party.

In the country as a whole, the Liberals were most successful in urban areas, winning 53 of their

100 seats in cities and suburbs. The Conservatives were most successful in rural areas, where they won 69 of their 116 seats. The prairie provinces remained overwhelmingly Conservative, while Ontario began to swing toward the Liberals. In four great cities of Canada—Montreal, Toronto, Vancouver, and Winnipeg—the Liberals won 37 seats, the New Democratic Party 10, and the Conservatives only 7. It seemed clear that electoral redistribution, which was due after the census of 1961 and which would give more representation to the urban areas, would have helped both the Liberals and New Democrats at the expense of the Conservatives. Trade union support might increase the New Democratic Party's representation in another election, but its hopes of becoming a genuinely national party were frustrated by its failure to make any impact in Quebec. Generally speaking, however, none of the parties could claim as the result of this election to be genuinely national in the sense that they could win solid support in all sections of the country.

Prime Minister Diefenbaker on August 9 reorganized his cabinet. He appointed as minister without portfolio Malcolm Wallace McCutcheon, a leading Toronto businessman who was expected to play an important part in the making of the economic policy of the new government. Donald M. Fleming was transferred from the Ministry of Finance to that of Justice, and was succeeded as finance minister by George C. Nowlan of Nova Scotia. E. Davie Fulton of British Columbia, who had not got on well with the prime minister, was demoted from minister of justice and attorney general to public works minister, and shortly thereafter he left federal politics to take up the leadership of the Conservative Party in British Columbia.

The 25th Parliament opened its first session on September 27. In the new Parliament most of the time before the Christmas recess was taken up by intricate party maneuvers to determine whether the two minor parties would support the Conservatives in office or would vote them out for the benefit of the Liberals. Neither the New Democratic Party nor Social Credit wanted an immediate election which would result from a vote of no confidence in the government, and so the Diefenbaker government remained in office. It provided for the creation of a National Economic Development Council and an Atlantic Development Board, thereby committing itself to the concept of national planning. By the end of 1962, however, there was little sign of what plans the government had beyond this for dealing with the vulnerable international economic position of the country.

Provincial Political Developments.—The most exciting events in provincial politics centered in Saskatchewan and Quebec. In the prairie province the Co-operative Commonwealth Federation, elected in 1960 on a program that promised to introduce a complete medical care scheme, passed a bill for this purpose which was to come into effect on July 1, 1962. The organized doctors in the province bitterly opposed the measure, and on July 1 they closed their offices. The extremely confused conflict was ended on July 24 after mutual agreement had been reached on a modified plan suggested by Lord Taylor, an eminent surgeon from Great Britain who acted as a mediator. The doctors were a minority who refused to obey a law which had been approved after due democratic processes; on the other hand, they claimed that their professional freedom was being infringed by the law. The conflict in Saskatchewan was recognized as an initial trial development affecting the decisions about public medical care in the other provinces. (See also SASKATCHEWAN).

CANADIAN GOVERNMENT TRAVEL BUREAU

Section of Trans-Canada Highway opened in 1962 traverses rugged beauty of Glacier National Park, British Columbia.

In Quebec the Liberal government of Jean Lesage, which had been elected in 1960, brought on a fresh election to give itself a mandate for nationalizing all hydroelectric corporations in the province. The policy was advocated on the ground that only in this way could the people of the province obtain control of their own economic destinies, which were allegedly in the hands of non-French business interests. Daniel Johnson, the leader of the Union Nationale opposition, found himself in a weak position on this issue, since the whole appeal of the Union Nationale Party under its late leader, Maurice Duplessis, had been based on French-Canadian nationalism. The Lesage government was returned with an increased majority on November 14. This success of the Liberals in making themselves the leaders of Quebec nationalism on a program of advanced social and economic reform helped the federal Liberal Party in its campaign to become once again the party of Quebec in federal politics.

In three other provinces there were provincial elections toward the end of the year. The voters returned the Liberal government of Joseph R. Smallwood in Newfoundland, the Conservative government of Walter R. Shaw in Prince Edward Island, and the Conservative government of Dufferin Roblin in Manitoba. (See also the articles on these provinces.)

Federal Financial Policies.—In 1961, Finance Minister Fleming had announced his intention of manipulating the exchange value of the Canadian dollar downward, so as to encourage exports and discourage imports, and thus bring about a better trade balance. By the early months of 1962 the value of the dollar was moving downward so rapidly because of a falling-off of foreign investments in Canada that the government had to take steps to counter the decline. On May 2, in the middle of the election campaign, the exchange rate of the Canadian dollar was set at 92.5 cents in terms of the U.S. dollar. The government on June 24 announced that it had borrowed more than $1 billion from Great Britain, the United States, and the International Monetary Fund in order to be able to hold the dollar at this level. It also imposed temporary surtaxes of from 5% to 15% on a long list of imports.

Informed observers had warned for months that the country was heading for trouble in its exchange position, but the government had always denied any cause for worry until the election was well out of the way. With this outside help toward establishing financial stability, international confidence in Canada's economic position apparently revived quickly, foreign investments poured into the country again, and by the end of the year stability seemed secure. The question remained, however, as to the wisdom of the government's handling of economic and fiscal policies which had made possible such a crisis. (See also FOREIGN INVESTMENTS; INTERNATIONAL TRADE.)

Commonwealth Relations.—The determination of the British government to join the European Economic Community had raised insistent vocal protests from members of the Canadian government in 1961. At the conference of Commonwealth prime ministers in London in September 1962, the conflict in policy between the British government on one side and most of the other Commonwealth governments on the other, came into the open. Previous conferences had been in the nature of quiet and confidential discussions among friendly governments, but this one was carried on practically as a public and very impolite debate. The British were accused of deserting the Commonwealth for Europe, and replied that they had a perfect right to pursue their own interests as they saw them. The Canadians seemed to regard the Commonwealth as primarily an instrument for their own economic interests. The conflict had not been resolved by the end of 1962. (See also COMMONWEALTH OF NATIONS; GREAT BRITAIN; EUROPE.)

Defense Policies.—Canada's defense commitments for the protection of the North American continent, as arranged with the United States through the North American Air Defense Command, and for the protection of western Europe through NATO involved the use of nuclear weapons. The decision to adopt these weapons had been steadily delayed by the Diefenbaker government. It was generally understood that Howard C. Green (q.v.), secretary of state for external affairs, was opposed to Canada's having nuclear arms; that Douglas S. Harkness, minister of national defense, was for nuclear arms; and that Prime Minister Diefenbaker had thrown his support behind the former.

When the Cuban crisis broke out in October, the inability of Canada to play an effective role in continental defense became embarrassing. Canada was not a member of the Organization of American States and had been persistently trading with Cuba against the wishes of the United States. The government hesitated for four days before making (on October 25) a very definite public statement aligning itself with the United States. The crisis ended quickly, but the uncertainty about Canada's defense policy remained.

FRANK H. UNDERHILL,
Former Professor of History, University of Toronto.

CANADIAN LITERATURE

Canadian writing in 1962 exhibited few new or genuinely exciting achievements. Beginners produced the most interesting fiction, whereas the most notable poetry was provided by poets of established reputation. Achievements in drama and criticism were unspectacular, but important work appeared in biography, history. and lexicography.

Fiction.—After a long absence, Hugh Garner returned from journalism to fiction with *The Silence on the Shore,* portraying boarding-house life in his favorite big city setting. W. O. Mitchell, whose popular *Jake and the Kid* sketches (1961) won a Leacock Medal for humor, also used his favorite setting, an Alberta country town, for *The Kite.* Some first novels, on the other hand, were unusual. *The Jokeman,* by Leo Vaughan, is an amusingly written novel set in England and Iran about an improbable picaresque hero blessed with both wit and an ironic affection for the errant human race. George Elliott's *The Kissing Man* exhibits a strangely compelling blend of the real and the other-worldly in portraying a rural Ontario township. *Not For Every Eye* is the first appearance in English translation of Gérard Bessette. It is a wry satire on small-town conformism in Quebec. Another interesting first novel was *Royal Murdoch,* by Robert Harlow. A highly promising first effort by Hugh Hood, *Flying a Red Kite,* was the only significant collection of short stories.

Drama and Poetry.—In drama, there were only two books of note. John Coulter's *Riel* is an ambitious but not very successful play built around the complex and controversial leader of the Northwest Rebellions. The poet James Reaney made his debut as dramatist with *The Killdeer and Other Plays,* which mixes the macabre and farcical, the familiar and fantastic, in Reaney's characteristic manner.

In poetry, the year's achievement was outstanding. Earle Birney's first book of new poems in ten years proved worth waiting for. Although scenes and experiences in Japan, Siam, India, and especially Mexico bulk larger than those in Canada, the point of view in *Ice Cod Bell or Stone* is nonetheless Canadian; and the poetry displays a higher craftsmanship combined with a more varied sensibility. By contrast, A. J. M. Smith's *Collected Poems* merely consolidated his past achievements; yet it is a memorable year when the 100 choicest poems of so skilled a poet as Smith are gathered together. Raymond Souster's *Place of Meeting* (1961) had an equally pleasing successor in *A Local Pride.* Other established poets who contributed to the year's harvest were James Reaney (*Twelve Letters to a Small Town*), Roy Daniells (*Chequered Shade*), and Phyllis Webb (*The Sea Is Also a Garden*).

Of the younger poets, most of the best were ably represented in *Poetry 62,* edited by Elias Mandel and Jean Pilon. Another anthology, containing poetry as well as short stories and articles, was *The First Five Years,* in which Robert Weaver offered the best contributions by some 40 authors to the quarterly *Tamarack Review* (founded in 1956).

Autobiography and Biography.—Among the more interesting reminiscences was *The Migration of Skivins,* an engagingly humorous account of a city man pioneering a prairie farm in the 1890's, written and charmingly illustrated by John Francis Wilson. The art historian Donald W. Buchanan recreated a country boyhood in *A Nostalgic View of Canada,* while John Glassco's *The Journals of St. Denis Garneau* threw new light on a fascinating personality in French-Canadian literature.

Biographers rescued from neglect several colorful lives. W. H. Graham's *The Tiger of Canada West* portrayed William Dunlop, settlement agent for the Canada Company; Marjorie W. Campbell's *McGillivray—Lord of the Northwest* dealt with the North West Company fur trader; and *Cuthbert Grant of Granttown,* by M. A. Macleod and W. L. Morton, presented the Manitoba fur trader and colonizer. George Whalley's *The Legend of*

John Hornby recreated the more recent life of an extraordinary man who was so fascinated by the risks and challenges of the Canadian North that he repeatedly subjected himself to the most extreme tests. More orthodox in subject and treatment was *The Fall and Rise of Mackenzie King: 1911–1919,* in which F. A. McGregor depicts King's single-minded pursuit of his goal, leadership of the Liberal Party.

The first four volumes of *The Gallery of Canadian Art,* edited by Alan Jarvis, inaugurated a series of well-illustrated studies of the work of individual artists.

History.—As the 1967 centennial of Canadian confederation approaches, the number of studies keyed to that occasion will steadily increase. In *The Life and Times of Confederation, 1864–1867,* P. B. Waite has sifted the publications of a century ago to show how the idea of confederation appeared to persons of widely divergent views. W. Stewart MacNutt's *New Brunswick, 1784–1867* also tied in neatly. Gerald M. Craig's *Upper Canada, The Formative Years, 1784–1841,* though the first to be published, is actually volume 7 of the projected 16-volume history of Canada in the Canadian Centenary Series. More narrowly localized are Edith G. Firth's *The Town of York, 1793–1815,* a vivid presentation of early Toronto, and *Vancouver, Sights and Insights,* by George Kuthan and Donald Stainsby, a combined portrait in line drawings and words.

Aspects of recent history were the concern of W. A. Riddell's *Documents on Canadian Foreign Policy 1917–1939* and Terence Robertson's *The Shame and the Glory—Dieppe.*

Other Nonfiction.—The only significant book of literary criticism was *Masques of Poetry,* edited by A. J. M. Smith. This is a collection of some twelve essays by as many critics of Canadian verse, and is a companion volume to the same editor's *Masques of Fiction* (1961). Though both books provide a fine sampling of Canadian criticism, the editor's modesty seriously weakened them: not one of his own influential essays was included.

In sociology and economics, S. D. Clark's *The Developing Canadian Community,* an analysis of the social forces operating in Canada, was supplemented by *The Public Purse, a Study in Canadian Democracy* by Norman Ward and *Labour Policy and Labour Economics in Canada* by H. D. Woods and Sylvia Ostry. Much wider in its implications is Marshall McLuhan's *The Gutenberg Galaxy: The Making of Typographic Man,* which presents the controversial thesis that whereas in the past Western society has been shaped by forces released by the development of printing, the future must be utterly different because of the transformations now being wrought by electronic communication.

Communication within Canada itself was a principal editorial concern of *The Canadian Dictionary, English-French, French-English,* the first work of its kind specifically designed for the nation's two official languages. Its special feature is the attempt to designate and define those words, phrases, and concepts in each language considered uniquely Canadian. A different group of lexicographers, also concerned with Canadian usages, but only in English, issued *The Beginning Dictionary,* the first of a projected four-volume set with the general title *The Dictionary of Canadian English.*

Perhaps the most unexpected offering of the year was *Wild Plums in Brandy* by Sylvia Boorman. This unique cookbook provides a collection of recipes enabling outdoorsmen and gourmets to create tempting fare from Canada's wild game, fish, fowl, and plants. The most predictable offering, on the other hand, was probably the seasonal volume of Eric Nicol's attractive humor, announced in 1962 under the title *A Herd of Yaks.* The most beautiful book was Roloff Beny's *A Time of Gods,* a magnificently designed and produced blend of ancient poetry with modern photography and scholarship. The poetry is Homer's *Odyssey,* in Chapman's translation, imaginatively used to complement superb photographs of Greek landscape, architecture, sculpture, and the rest. Informative notes help to interpret the living meanings in what was recorded by poet and camera.

Children's Books.—The best of the many books for children was unquestionably *Four Ages of Man: the Classical Myths,* by the poet Jay Macpherson. Here the most enduring of the ancient tales are imaginatively retold in a fresh poetic prose, and unobtrusively accompanied by sufficient supplementary material to make the book authoritative as well as entertaining. *The Winkle Pickers* by Bill Straiton offered delightful nonsense rhymes brilliantly illustrated by the Vancouver cartoonist Len Norris. *The Island of Fish in the Trees* by Eva-Lis Wuorio possessed the sort of charm that is memorable but indescribable. Also worthwhile were Roderick Haig-Brown's *Fur and Gold* and Margaret Mason Shaw's *The Bush Pilots.*

The Royal Military College of Canada.

French-Canadian Literature

Some of the most significant books published in 1962 by Canadian authors writing in French are noted in the following article.

Fiction.—The two best novels of 1962 were also among the shortest. *Laure Clouet,* by Adrienne Choquette, is the portrait of an austere and retiring spinster; her simple life is troubled by the visit of a young couple, whose love brings her the revelation of the flesh. The other, *L'aquarium,* by the young poet Jacques Godbout, is a satire about a small group of European and American technical advisers to an African country, whose natives bore them. Gabrielle Roy's novel, *La montagne secrète,* is the unconvincing story of a Canadian painter in quest of ideal beauty, first in the Arctic, then in Paris.

Other novels of merit include *Quand j'aurai payé ton visage* (the eternal triangle) by Claire Martin; *Les commettants de Caridad* and *Amour au goût de mer* by the prolific Yves Thériault; *L'or des Indes* by Pierre Gélinas; *Le poids de Dieu* (about a priest) by Gilles Marcotte; and *Délivrez-nous du mal* by the beatnik Claude Jasmin.

The best short-story collections are by Jacques Ferron, *Cotnoir* and *Contes du pays incertain,* whose dark naturalism contrasts with his fanciful *Cécile Chabot el le cheval vert.*

Poetry.—Gilles Hénault collected in book form his best recent poems, including the forceful *Voyage au pays de mémoire,* under the title *Sémaphore.* Also worthy of mention are Jean-Paul Filion's *Demain les herbes rouges;* François Hertel's *Poèmes européens;* Jean Ménard's *Plages;* and Suzanne Paradis' *La chasse aux autres.*

Nonfiction.—Three remarkable collections of essays appeared in 1962. Jean Le Moyne collected in *Convergences* (his first book) his best essays, which were scattered among 25 years of periodicals; they show deep religious insight and force. The painter Jean Simard, in *Répertoire,* which is in the form of a diary, comments on art and literature and their place in society. The younger writer Gilles Marcotte collected in *Une littérature qui se fait* his best critical essays on French-Canadian authors. Two ironical books of essays are *Le scandale est nécessaire,* by Pierre Baillargeon, and *Journal philosophique et littéraire,* by François Hertel. The most significant historical works are *Témoignages d'hier* by the diplomat Jean Bruchési, and Julienne Barnard's *Mémoires Chapais;* the papers of Jean Charles Chapais, Marcel Gagnon's *La vie orageuse d'Olivar Asselin* and André Laurendeau's *La crise de la conscription* are also noteworthy.

CANAL ZONE. See Panama Canal.

CANALS

Major improvement projects continued in 1962 on the Panama and Suez canals, and considerable canal construction moved forward in the United States, Pakistan, and the Soviet Union.

Panama Canal.—Important progress was made in 1962 toward widening the treacherous man-made Gaillard Cut section of the Panama Canal to speed the passage of ships. A $7.5 million contract for widening 1½ miles of the 8-mile cut from 300 to 500 feet was completed ahead of schedule. This narrow passage, subject to landslides, has impeded traffic since the canal's early days. The work completed in 1962 involved blasting and excavating over 10 million cubic yards of earth and rock.

In the year ending June 30, 1962, a record number of toll-paying ships used the Panama Canal. Over 11,000 vessels, carrying 67.6 million long tons of cargo, were lifted from ocean to ocean and paid fees of $58.4 million. (See also PANAMA CANAL AND CANAL ZONE.)

Suez Canal.—A record revenue of more than $150 million was registered by the Suez Canal in 1962, compared with $103.7 million in 1959. Tonnage was 185.3 million in 1960, compared with 115.7 million in 1955. To exploit this traffic increase, the United Arab Republic's Suez Canal Authority in 1962 had nearly completed the first stage of its $185 million improvement program, called the Nasser Project but actually initiated by the old Suez Canal Company. A widening contract awarded in February 1962 involves removal of 2.2 million cubic yards of sand and silt in the vicinity of a railroad bridge under construction. Contractors working in other stretches had removed about 13.7 million cubic yards of material above the canal's water line and about 110 million cubic yards below the water line. According to the authority, vessels drawing 37 feet can now transit the canal, compared with a 34-foot 6-inch draft in 1956.

Mississippi River–Gulf Outlet.—Second-stage work on New Orleans' shipping shortcut to the Gulf of Mexico—a 76-mile tidewater ship channel—was virtually complete by late 1962. The channel will cut 40 miles off the present river route to the Gulf. In 1962 the channel was 36 feet deep and 250 feet wide. The final stage of the work, to be completed in 1967, will widen the waterway to 500 feet and provide clear sailing for oceangoing shipping.

West Pakistan.—Major canal construction got under way in 1962 on the huge Indus Basin Project. Work started on a $25 million contract to construct one irrigation canal and relocate another. The new one, the Trimmu-Sidhnai Canal, will run 44 miles from Trimmu on the Chenab River to Sidhnai on the Ravi River. The canal will be 250 feet wide at the bottom and 11 feet deep, and will have a capacity of 11,000 cubic feet of water per second. A group of Italian firms has begun work on another 59-mile section, the $42 million Sidhnai-Mailsi Canal, which links the Ravi River with the Sutlej River running south from the Trimmu-Sidhnai link.

Soviet Union.—The USSR in May 1962 announced completion of the 500-mile-long Kara Kum Canal in the central Asian desert. The new waterway, 100 to 150 feet wide, taps the Amu Darya, a major stream in central Asia north of Afghanistan, and delivers irrigation water to Ashkhabad, capital of the Turkmen Republic, 90% of which is desert. The canal is expected to increase by 50% the amount of land under irrigation, mostly for cotton production. The Soviet Union also announced that work had started on a canal system to link the Baltic Sea with the Black Sea. The system will involve the Dnieper, Pripyat, and Neman rivers, and will include a 43-mile-long connecting canal. The total length of the navigation link will be about 1,500 miles.

Yugoslavia.—A $100 million multipurpose water project in Yugoslavia was scheduled for completion in 1966. The project involves a 356-mile network of canals and 13 navigation locks, and will provide irrigation for 360,000 acres as well as flood protection and drainage for 1.9 million acres.

CANCER

The increasing activity in cancer research throughout the world was clear in the attendance of 5,000 scientists at the 8th International Cancer Congress, which was held in Moscow, July 22–28, 1962. Support for research and training in the field of cancer remains high in the United States. For the fiscal year 1962–63, Congress appropriated $63,280,000 for research, $13,470,000 for training, and $4,788,000 for fellowships; and the American Cancer Society has allocated 34% of its annual budget of over $36,000,000 for research.

Incidence.—The incidence of gastric cancer continues to decrease in the United States. In some clinics the number of cases seen has decreased almost 50% in the past 10 years. Meanwhile, lung cancer becomes more common; in Great Britain, from 1956 to 1960 it has increased from 72 to 86 per 100,000 persons, and lung cancer is responsible for 35% of all cancer deaths in males in that country. A report of the British Royal College of Physicians stated that cigarette smoking is a cause of lung cancer, and the British government is attempting to discourage smoking, particularly among the young. The United States government also has undertaken an investigation into smoking and lung cancer. (See also HEART DISEASE.)

A recently recognized form of cancer, a lymphoma in children, has been described in equatorial Africa. While it often presents itself as a tumor of the jaw, it is a generalized disease that is fatal within a few months. Because of its peculiar geographical distribution, the possibility that it is of infectious origin, possibly due to a virus transmitted by an insect vector, is under study.

In studies on Enovid, a hormonal antifertility preparation (see ENDOCRINOLOGY), it was noted that the expected incidence of carcinoma of the cervix of the uterus was markedly reduced in the women who have been receiving the preparation up to six years. If this preliminary observation is confirmed, it may be possible to administer appropriate hormones prophylactically to prevent the development of cancers in organs influenced by sex hormones, such as the breast and uterus. Techniques to improve the ability to diagnose early breast cancer are urgently needed. Two methods now under study are X-ray examination of the breast (mammography) and infrared thermometry to detect abnormal nodules.

Carcinogenic Viruses.—The viral etiology of cancer gains strong support in animal studies. Two strains of adenovirus, types 12 and 18, which produce relatively minor infections in man, were found by J. J. Trentin and R. J. Huebner, respectively, to produce tumors in newborn hamsters. Of perhaps greater importance, a simian virus (SV–40) was shown by Bernice E. Eddy to induce malignant tumors in hamsters and to cause nuclear changes in normal human cells exposed to the virus in tissue culture. SV–40 has contaminated some vaccines grown on monkey kidney tissue, such as polio vaccine, and careful efforts are being made to eliminate it. The fact remains that there are many viruses which are carcinogenic in some laboratory animals, although their relation to human cancer remains unclear.

Prevention and Treatment.—Various new procedures are under study to prevent cancer or to improve the treatment of established cancer. Dr. Bertil Bjorklund of Stockholm has vaccinated patients with cancer tissue, on the premise that the injected cancer tissue has a specific antigen which may immunize the patient against subsequent de-

velopment of the disease. This study has received wide publicity, although it remains a very questionable procedure.

In lung cancer, the preoperative use of radiation to the diseased area may improve the resectability and 5-year "cure" of the disease. The hope is that the "cure rate" may be raised from the present level of less than 5% to 20%. Hydrogen peroxide has been infused into the arterial supply to tumors in man in order to increase the local oxygenation of the tissue and thereby improve the local effects of radiotherapy. This combined approach has been the subject of a preliminary experimental report by John T. Mallams, George A. Balla, and James W. Finney of Dallas.

The depression of blood platelet levels with bleeding manifestations and low leukocyte counts resulting in infection are complications that occur in some patients with neoplastic disease, principally with leukemia. Methods have been developed to produce platelet concentrates from blood, and these are used to prevent bleeding. White cells have been obtained from patients with chronic myelocytic leukemia who have high leukocyte counts and transfused into patients with low leukocyte counts to treat severe infections.

Chemotherapy.—The systematic search for drugs effective against cancer continues, but no major therapeutic advances were recorded during 1962. The chemical structures of the alkaloids of *Vinca rosea*, vinblastine, and leurocristine have been reported by chemists of Eli Lilly & Company. Leurocristine has induced brief remissions in acute leukemia in children, and is a useful addition to the other drugs temporarily effective for this condition. The chemical structure of Mitomycin C, an anticancer antibiotic originally discovered in Japan, and several related chemicals has been elucidated by chemists of American Cyanamid Company. Clinical studies with Mitomycin C have been conducted principally in Japan and the United States, and its practical role in the treatment of cancer is uncertain. Other drugs undergoing early clinical trials against various forms of cancer include a number of terephthalanilides, hydroxyurea, hadacidin, and methylglyoxal *bis* (guanyl hydrazone). Further studies with progestational hormones such as Delalutin have shown that they are temporarily effective in about 20% of patients with metastatic carcinoma of the endometrium.

CANNING INDUSTRY

One of the major areas of research in the canning industry is the replacement of expensive hand-picking operations by mechanical picking. By the end of 1962, mechanical harvesting techniques had cut in half the cost of picking red sour cherries, prunes for drying, and high-bush blueberries, and further improvements in the methods were awaited. Engineers were trying to perfect mechanical techniques for picking apples, clingstone peaches, and apricots. One of the major unsolved problems remained the mechanical harvesting of tomatoes.

The factors involved in mechanical picking involve the position of fruits near base limbs, rather than on long flexible limbs, and simultaneous ripening of all the fruits (a problem which involves genetic characteristics; for tomatoes, no solution to this problem had been devised). Other considerations are damage to the bark of the trees from limb attachment devices, and bruising resulting from the collecting arrangements.

Edward F. Kohman,
Research Chemist and Consultant.

U.S. PRODUCTION OF CANNED FRUITS AND VEGETABLES

Product	Number of Cases 1960	1961
Fruits:		
Apples[1,2]	3,325,982	3,985,869
Applesauce[2]	17,570,622	18,093,370
Apricots	7,443,362	5,797,501
Blackberries	286,847	284,916
Blueberries	505,331	553,250
Cherries (red, pitted)	2,218,860	3,138,522
Cherries (sweet)	980,528	1,704,489
Citrus salad (orange and grapefruit)[2]	546,313	378,483
Cranberry sauce	4,243,666	6,547,693
Figs	658,165	586,590
Fruit cocktail	18,135,249	19,236,300
Fruits (mixed California pack)	390,526	442,820
Fruits for salad (California pack)	1,101,058	1,042,143
Gooseberries	43,165	42,156
Grapefruit sections[3]	4,374,917	4,766,088
Olives (ripe)[2]	2,869,689	2,050,000[5]
Peaches	34,388,829	34,953,902
Peaches (spiced)	847,831	648,497
Pears	10,671,452	11,360,760

CASTRO, Fidel

Cuban premier (full name: Fidel Castro Ruz): b. Mayarí, Oriente Province, Cuba, Aug. 13, 1926.

As the great powers united against Castro in late 1962 to force his acceptance of their proposed agreement to end the Cuban crisis, the "maximum leader" of the Cuban revolution was the subject of intense speculation throughout the world. Despite the most careful scrutiny of his remarkable history, however, the questions about him persisted—how old and how deep-seated were his Marxist-Leninist convictions, and to what extent was he using or being used by the Sino-Soviet bloc.

WIDE WORLD

Cuban Premier Castro (left) and President Dorticós (right) welcome Algerian Premier Ben Bella to Havana, October 17.

The son of a sugar plantation owner, Fidel Castro received a doctor of law degree in 1950 from the University of Havana. On July 26, 1953, he led an abortive attack on a government post in Santiago de Cuba and was imprisoned until amnesty was declared in 1954. In Mexico, in 1955, he organized another strike against President Fulgencio Batista's government, and on Dec. 2, 1956, he returned to Cuba with about 80 followers, all but 11 of whom were killed or captured. From his headquarters in the Sierra Maestra, in Oriente Province, he gradually expanded a guerrilla war against the government. His 26th of July Movement overthrew the regime of President Batista and seized power on Jan. 1, 1959. Since then, Castro's nationalization of industry, his agrarian and educational reforms, and his attacks on religion have followed the Communist pattern, while in foreign trade and foreign relations he has brought Cuba closer to the Sino-Soviet orbit.

On Jan. 2, 1962, Castro reiterated his declaration, initially made one month earlier, that he was a Marxist-Leninist and had been for years. Addressing young Cubans on March 14, he urged a more intense Communist spirit in them and promised them a future in a Communist society. On March 26, however, he delivered a fierce attack against one of the principal Communists in the government, Anibal Escalante, who was dismissed the next day from his position in the directorate of the all-powerful Integrated Revolutionary Organizations (ORI). Castro's speech, which criticized the "sectarianism" of militant Communists, encouraged some observers to infer the existence of a breach between Castro and old-line Cuban Communists. Others interpreted Escalante's ouster as a party purge, and noted the continuance in office of such Communist stalwarts as Blas Roca and Carlos Rafael Rodriguez, who on February 14 had replaced Castro as president of the agency controlling Cuban agriculture.

Castro was plagued by agricultural and other economic difficulties throughout 1962. In a number of the long, histrionic speeches for which he is famous, he repeatedly imputed responsibility for Cuban troubles to the United States. On February 4 he accused the United States of "economic aggression" in maintaining the embargo on Cuban trade that was declared on Oct. 19, 1960; and on March 12, when he announced an extension of rationing, he cited the embargo as the reason for it. His warnings to the Cubans of imminent invasion attempts became more insistent as the year progressed, as he apparently tried to exploit anti-American feeling to unify his people and distract them from their hardships. Some authorities attributed the installation of Soviet missile bases on Cuban soil chiefly to Castro's need for them to implement his campaign against the United States.

Responding on October 23 to the announcement of the United States quarantine of Cuba, Castro called the quarantine a violation of Cuba's sovereign rights, and announced his adamant refusal to allow United Nations inspectors into Cuba. On October 28, in his first official reaction to the agreement reached by President Kennedy and Premier Khrushchev, Castro demanded that the United States relinquish its naval base at Guantanamo as part of its assurance that it would not invade Cuba. He invited UN Acting Secretary General U Thant to Havana to discuss the inspection of Cuban missile sites (which had been pledged by Khrushchev), but their meetings on October 30–31 failed to resolve the issue. It was taken up by Soviet First Deputy Premier Mikoyan, who after 24 days of discussions in Havana in November, finally secured Castro's agreement to return the Soviet jet bombers that he had earlier claimed as Cuban property. It was generally agreed that Castro had suffered an enormous loss of prestige as a result of the Soviet withdrawal of offensive weapons from Cuba, but he again reiterated his belief in communism after Mikoyan's departure.

CENSUS DATA, U.S.

The total population of the United States, excluding armed forces abroad, was estimated at 185,822,000 on July 1, 1962. There had been an increase of 6,498,000, or 3.6%, since April 1, 1960, the date of the latest census, and of 2,779,000, or 1.5%, since July 1, 1961. Including armed forces overseas, the population on July 1, 1962, was estimated at 186,591,000. (See Table 1.)

Characteristics of the Population.—Early in 1962 the Census Bureau published its first estimates by age, color, and sex since the 1960 census. Persons of high school age (14 to 17) increased more rapidly than any other age group between April 1960 and July 1961. Children under 5 and of elementary school age (5 to 13), who had increased so rapidly in the 1950–60 decade, had rates of growth less than the average for all ages between April 1960 and July 1961. During the same period, the number of persons aged 18 to 24 increased sharply, whereas the number in the 25 to 34 group declined slightly. The number of persons 35 to 64 grew somewhat more slowly than the population of all ages, while the group aged 65 and older increased faster than the population as a whole. (See Table 2.)

The nonwhite population continued to grow more rapidly than the white population, increasing by 3% between April 1960 and July 1961. The white population grew by 1.9% in the same period. In 1961, the nonwhite population numbered approximately 21 million, or 11.5% of the total.

The excess of females in the population continued, with 97.7 males per 100 females in 1961. In 1960 the sex ratio was 97.8 males per 100 females; in 1950 it was 99.3 to 100.

Household Characteristics.—In 15% of the estimated 54.7 million households in the United States in March 1962, the household head lived alone or with nonrelatives only. In 2 out of 3 of these 8.5 million households the heads were women. The 46.2 million households where there were relatives of the household head were composed of 40.3 million husband-wife households,

Table 1—POPULATION OF STATES, 1960 AND 1962[1]

	Population		Percent increase (+) or decrease (−) 1960–62
	July 1, 1962 (prov.)	April 1, 1960 (census)	
United States	185,822,000	179,323,175	+3.6
Alabama	3,358,000	3,266,740	+2.8
Alaska	246,000	226,167	+8.7

Virginia	4,177,000	3,966,949	+5.3
Washington	3,006,000	2,853,214	+5.4
West Virginia	1,773,000	1,860,421	−4.7
Wisconsin	4,092,000	3,951,777	+3.6
Wyoming	365,000	330,066	+10.7

[1] Figures include persons in the armed forces stationed in each state, and exclude members of the armed forces abroad. [2] Gain of less than 0.05 percent.

1.3 million other households with male head, and 4.6 million with female head.

Family Income.—The average (median) income of families in the United States was $5,700 in 1961, according to the results of a sample survey conducted in March 1962. The estimate for 1961 was about $120, or 2%, higher than in 1960. Consumer prices rose by about 1% during the same period. (See also INCOME.)

School Enrollment.—School enrollment early in the 1961–62 school year reached a new high of 47.7 million students. Of these, 2.3 million were in kindergartens, 30.7 million were in elementary schools (grades 1 to 8), 11.0 million were in high schools, and 3.7 million were in colleges and universities. (See also EDUCATION.)

Table 3—NUMBER OF U.S. FAMILIES BY 1961 FAMILY INCOME

Family income	Number of families
Total	46,341,000
Under $1,000	2,316,000
$1,000 to $1,999	3,573,000
$2,000 to $2,999	4,037,000
$3,000 to $3,999	4,387,000
$4,000 to $4,999	4,845,000
$5,000 to $5,999	5,439,000
$6,000 to $6,999	4,714,000
$7,000 to $7,999	4,231,000
$8,000 to $9,999	5,375,000
$10,000 to $14,999	5,219,000
$15,000 and over	2,205,000

Mobility of the Population.—About 35.5 million people had moved at least once in the March 1960–March 1961 period. This figure represented 20% of the population of 177.4 million people 1 year old and over in the United States in March 1961. Of these movers, about 24.3 million, or 13.7% of the total population 1 year old and over, moved within the same county; 5.5 million, or 3.1%, moved between counties in the same state; and 5.8 million, or 3.2%, moved between states.

Retail Trade.—The Census Bureau's monthly retail trade reports showed cumulative sales of all retail stores for the first six months of 1962 amounting to $111.4 billion, 8% above the $103.6 billion for the same period in 1961. (See also RETAIL STORE SALES.) In 1962 the Census Bureau began a new series of weekly reports measuring weekly sales of retail stores.

Wholesale Trade.—Monthly wholesale trade reports showed cumulative sales of merchant wholesalers for the first six months of 1962 totaling $71.0 billion, up 6% over sales in the same period of 1961. (See also WHOLESALE SELLING.)

Manufacturing.—During 1961 the value added by manufacture in the United States amounted to $163.8 billion, according to figures published in 1962, based on the 1961 Annual Survey of Manufactures. Total manufacturing employment for 1961 averaged 16.3 million employees. Capital expenditures for plant and equipment, excluding plants not yet in operation, amounted to $9.4 billion. (See also INDUSTRIAL PRODUCTION; LABOR; WAGES AND HOURS.)

Construction Statistics.—Spending for new construction in the first six months of 1962 amounted to $27.7 billion, 6% above the $26.1 billion spent in the comparable period of 1961. New private construction expenditures amounted to $20.0 billion in the first six months of 1962, compared with $18.5 billion in the like period of 1961; public construction expenditures totaled $7.8 billion in the first half of 1962, compared with $7.6 billion in the first half of 1961.

A new monthly sample survey begun in 1962 added to the Census Bureau's construction series a report on sales and financing of new houses. The first report showed a total of 185,000 private nonfarm single-family dwellings started during the first quarter of 1962, of which 118,000 —or 64%—were intended for sale. Homes built by a single general contractor for the exclusive use of the owner accounted for 30,000 units, or 16%. The remaining 37,000 units, or 20% of the total, were shell homes, rental homes, and those for which the owner acted as his own general contractor or performed some or all of the work. Among homes sold in the first quarter of 1962, 68% were reported as sold for under $20,000, and 30% at higher prices, while

Table 2—U.S. POPULATION CHANGE, BY AGE: 1950 TO 1961
(Numbers in thousands)

Age	Population including Armed Forces abroad			Population change			
				April 1, 1960, to July 1, 1961		April 1, 1950, to April 1, 1960	
	July 1, 1961	April 1, 1960	April 1, 1950	Number	Per cent	Number	Per cent
All ages	183,642	180,004	151,718	+3,638	+2.0	+28,286	+18.6
Under 5 years	20,609	20,321	16,243	+288	+1.4	+4,078	+25.1
5 to 13 years	33,271	32,726	22,281	+545	+1.7	+10,445	+46.9
14 to 17 years	12,035	11,162	8,447	+873	+7.8	+2,715	+32.1
18 to 24 years	16,923	15,971	16,149	+952	+6.0	−178	−1.1

65 and over	17,011	16,560	12,295	+451	+2.7	+4,265	+34.7

prices were not reported for 2%. (See also BUILDING AND CONSTRUCTION; HOUSING.)

Governmental Statistics.—According to the Census Bureau's annual summary of governmental finances, taxes collected by all governments in the United States—federal, state, and local—amounted to $116.3 billion in their fiscal years that ended during 1961, as compared with a 1960 total of $113.1 billion. Most of the change was accounted for by state and local governments, whose tax revenue rose from $36.1 billion to $38.9 billion. Taking account of all other revenue sources as well as taxes, governmental income in the fiscal year 1961 totaled $158.7 billion, up $5.6 billion from 1960. Expenditure totaled $164.9 billion in fiscal 1961, up $13.6 billion from 1960. Indebtedness of all governments at the end of their 1961 fiscal years totaled $364 billion. This total included federal public debt amounting to $289 billion on June 30, 1961, or $3.7 billion more than a year before. State and local government debt rose $5.1 billion during the fiscal year 1961 to a record of $75 billion.

A preliminary report of the 1962 Census of Governments showed that property subject to local property taxes in the United States is officially assessed altogether at $367 billion.

RICHARD M. SCAMMON,
Director of the Census.

CENTRAL AFRICAN FEDERATION. See RHODESIA AND NYASALAND.

CENTRAL AFRICAN REPUBLIC

An independent state of the French Community, the Central African Republic is situated in central Africa north of the equator. Estimated area, 238,200 square miles. The population of 1,227,000 (mid-1960 est.) consists chiefly of Bantu ethnic groups, 90% of whom live in rural areas, and includes about 6,000 Europeans. The official language is French. Principal towns: Bangui, the capital (1962 est. pop., 100,000); Bouar (1959 est., 20,700); Bambari (19,700); and Berbérati.

Government.—The Central African Republic, formerly the French overseas territory of Ubangi-Shari (within French Equatorial Africa), became independent on Aug. 13, 1960. The Legislative Assembly of 50 members, elected for a five-year term by universal suffrage, elects the president of the republic. David Dacko, leader of the Movement for the Social Emancipation of Black Africa (MESAN), was elected president in April 1959, after his party won a large majority in elections to the assembly. The republic is a member of the Union of the Republics of Central Africa.

Education and Religion.—About 90% of the population is illiterate. School enrollment, 1960: 70,714 (16% of the school-age population), including 67,510 primary, 1,551 secondary, 1,305 technical, and 348 teacher-training students. Higher education is provided by the University of Dakar in Senegal. The majority of the population are animists, but Christianity has penetrated into many areas.

Transportation.—As the landlocked republic is without railroads, chief means of transport are the road network (3,600 miles of all-weather roads), and the Ubangi River (navigable for 370 miles in the republic) and other rivers. External trade passes through Bangui, one of the great river ports of Africa. Major airports are located at Bangui, Berbérati, and Bouar.

Agriculture.—Principal subsistence crops: millet, rice, cassava, bananas, and citrus fruits. Chief cash crops (metric tons, 1961 est.): cottonseed, 27,000; coffee, 8,000; sesame seed, 1,500; palm kernels, 800; rubber, 800; and tobacco, 250. Estimated number of livestock, 1962: cattle, 350,000; sheep, 80,000.

Industry.—Industry is confined to processing agricultural products. Chief minerals are diamonds (50,000 carats produced in 1961) and gold. Exploitation of the considerable forest resources is limited by lack of transport facilities; output of lumber totaled 142,000 cubic meters in 1960.

Foreign Trade.—Total exports, 1961: $13.8 million; imports, $21.0 million. (Figures exclude trade with the neighboring republics of Congo and Chad.) Chief exports: cotton and coffee; chief imports: fuels, cotton cloth, foods and beverages, metals, and cement. France is the republic's chief trading partner.

Events, 1962.—The government continued to restrict the activities of opposition elements. Early in the year a governmental court sentenced two opposition leaders and former government officials, Abel Goumba and Pierre F. Maleombho, to six-month jail terms for allegedly "endangering the security of the state."

President David Dacko was host to the chiefs of state of the so-called Brazzaville group of 12 African nations at a conference held in Bangui on March 25–27. The leaders agreed to establish a permanent secretariat for their organization and to formulate a common policy toward the European Economic Community. (See also AFRICA.)

CENTURY 21 EXPOSITION

The Seattle World's Fair, or Century 21 Exposition, held in Seattle, Wash., from April 21 to Oct. 21, 1962, was the first world's fair to be held in the United States in 23 years. It presented a preview of the life that the advancement of science promises to make possible for man in the 21st century.

The fair was first conceived as a semicentennial celebration of the Alaska-Yukon-Pacific Exposition, held in Seattle in 1909 on what is now the campus of the University of Washington. This concept was later discarded in favor of providing a wider understanding of the role of science in promoting man's progress. Supported by a bond issue approved by the citizens of Seattle for a community center, fair planners obtained matching support from the State of Washington and commitments from King County (Seattle) to construct certain exhibit halls. These efforts and the interest of the National Science Foundation in a world's fair of science encouraged Congress to authorize federal participation, both financially and with exhibits.

The major symbol of the fair was the 607-foot steel and glass Space Needle. The spire, which was taller than the Washington Monument, was topped by a circular glass-enclosed restaurant which made one complete revolution every hour, and above it an observation deck from which visitors could view Seattle and Puget Sound. High-speed elevators, shaped like space capsules, were mounted on the outside of the Needle's steel core. Part way up the Needle a platform held the stentors for the world's largest electronic carillon. Built by private funds at a cost of $3.5 million, the Needle was designed to withstand nearly twice the earthquake shock and half again the highest wind velocity ever recorded in Seattle.

A monorail with two 4-car trains operated on separate precast concrete beamways above tree-lined streets between downtown Seattle and the fair site. The monorail was studied by representatives of many metropolitan areas which are searching for solutions to mass-transit problems.

The Federal Science Pavilion contained the most complete and authentic science exhibit ever assembled. This five-building pavilion presented a digest of all that had been discovered about outer space and a feeling of the immensity of space and the relative smallness of man's place in the universe. The other major exhibit was the Washington State Coliseum, which provided nearly four acres of unobstructed viewing space under a hyperbolic-paraboloid aluminum roof, 11 stories high. The Coliseum housed the theme exhibit of the fair, depicting in a cubistic floating city how man would live in the space age.

A total of 48 foreign countries exhibited at the fair, as did many major United States companies and government agencies. One of the most popu-

Scenes at Seattle's Century 21 Exposition. (*Above*) Passengers on simulated space flight pass model of moon. (*Right*) Various rides and amusements are on the Gay Way; in background is the 600-foot-high Space Needle. (*Bottom of page*) The United States Science Exhibit, illuminated at night.

lar exhibits was that of the National Aeronautics and Space Administration (NASA), showing the progressive steps toward conquering space. The NASA exhibit contained an array of full-sized models of the entire NASA inventory of scientific vehicles that were being used in space exploration. For much of the duration of the fair, NASA exhibited *Friendship 7*, the space capsule in which Lt. Col. John H. Glenn, Jr., became the first American to orbit the earth.

Continuous entertainment in the performing arts was presented in the 3,100-seat Opera House, a new playhouse, an arena, and an outdoor stadium. Many of the world's leading artists in ballet, opera, symphony, drama, comedy, and jazz performed in these facilities. One of the world's largest collections of museum masterpieces of paintings and sculpture from the Renaissance to the 20th century was also shown.

The fair, one of the very few world's fairs to be successful financially, drew a total paid attendance of nearly 9.7 million persons. The economic impact of these visitors was reflected in the statistics of nearly every indicator of trade and service activity in the Northwestern states and western Canada.

Unlike most world's fairs, which have consisted primarily of temporary buildings, the Seattle fair left permanent structures that were being converted into an imposing cultural, trade, and sports center. Before the fair had closed its gates the Seattle Center Commission had developed plans for site restoration and conversion of the fair buildings into an imposing Seattle Center. Plans called for the Space Needle to continue as a symbol, a landmark, and a restaurant. The monorail, for a year at least, will continue to link downtown Seattle with the Seattle Center. The Federal Science Pavilion will be turned over to the Pacific Science Center Foundation, and will be known as the Science Center. The Washington State Coliseum will be converted into a sports and convention hall capable of seating up to 18,000 persons. The International Fountain, Opera House, Playhouse, Arena, the perimeter buildings of the Coliseum, the Hall of Industry, the Commerce-Fashion-Interiors Pavilion, the overhead tramway, and a small amusement zone were also to be retained.

After removal of the temporary buildings and concession kiosks, malls will be created between the Opera House and the Federal Science Pavilion and from the Coliseum through the International Fountain to the Space Needle. The new Seattle Center was expected to open in April 1963 with an Easter festival, to be followed by a summer festival.

WARREN W. ETCHESON,
Assistant Dean, College of Business Administration, University of Washington.

CERAMICS

Gross production in the ceramic industry for 1962 was at a high level in the United States, totaling approximately $7.5 billion. Equal to that of 1961, this volume was considerably influenced by increased activity during the last quarter of the year. Competition from imported, low-cost products continued to force American industry into the use of mechanical operations and automation to effect lower production costs.

Glass.—The glass industry again experienced a successful year of high production and extensive business, but the margin of profit declined somewhat. Increased competition was faced from abroad, especially in the fields of flat glass, fine crystalware, and tableware, as well as various electronic products. Shipment of glass containers, glass fibers, and electronic products maintained a very high level.

The electronics field, in particular, showed a marked increase in volume, and probably the brightest spot of the industry was the public's acceptance of color television. This has been due to technological advances, cheaper sets, and improved broadcasting facilities of some of the major companies.

Corning Glass Works announced an exciting new product, Chemcor, said to possess five times the strength ever before developed in glass. The method of production employs a chemical treatment which represents a major advance in glass technology. (See also CHEMISTRY.)

Whitewares.—Developments in the whiteware industry have centered around making stronger and thinner bodies. The use of extremely fine, micron-size silica has shown promise. Production costs have been reduced by the utilization of better prepared or tailored clay mixtures. The economic threat of imported ware from Japan still exists, although it is not as acute as it has been in previous years. Because the major interest of Japanese industry is in larger volume exports, its interest in whitewares has declined somewhat. In an attempt to lower production costs, the industry has resorted to the reduction of decorations, special shapes, and other unusual items which require increased labor costs. The industry also has begun to benefit from a Whiteware Research Association. The floor- and wall-tile industry has been increasingly affected by imports. It is hoped that technical advances may aid this industry.

Vitreous Enamels.—Vitreous coatings for metal products continued at a high level, and high-temperature coatings for nuclear ceramics have shown increased use. The conventional enameled appliances and architectural enamels maintained levels close to those of 1961.

Refractories and Abrasives.—Production in the refractory and abrasive industry continued at a high level, probably exceeding 1961 by 2 to 3 per cent. The most promising development in the abrasive-grain area has been sintered abrasives. This makes possible production of new shapes and controlled microcrystallinity for special application. The improved properties have permitted a trend to higher grinding speeds and pressures.

In the refractory field, improvements continued in the fusion casting of refractory tile and block so that more corrosion resistance is permitted. Diamond grinding provides better assembly so that joint wear is considerably reduced in many furnaces.

Brick and Structural Clay Products.—The structural clay products industry has been greatly aided by the use of lightweight aggregates, producing clay units of lighter weight. The decrease in weight, however, has necessitated the development of improved surface coatings and glazes, which, in turn, have provided better protection from exposure, enhanced the appearance of the product, and increased its decorative possibilities.

HAROLD E. SIMPSON,
Professor of Glass Technology,
College of Ceramics, Alfred University.

CEREAL GRAINS. See AGRICULTURE; GRAINS.

CEYLON

Separated from India by the Palk Strait and the Gulf of Mannar, this island in the Indian Ocean is 270 miles long, extends 140 miles at its greatest width, and has an area (with outlying islands) of 25,332 square miles. A crown colony of Great Britain from 1802, Ceylon attained independence within the Commonwealth of Nations on Feb. 4, 1948, and is a member of the United Nations. The population (8,154,580 at the 1953 census) was estimated at 10,167,000 in mid-1961. Sinhalese (6,993,000 in 1960) comprise about 70% of the population; Ceylon Tamils and Indian Tamils about 22%; other chief ethnic groups are Ceylon Moors, Indian Moors, Malays, Burghers, and Eurasians. Sinhalese was made the sole official language in 1961. Colombo (pop., 426,127 in 1953) is the capital.

Government.—A governor general (William Gopallawa, former ambassador to the United States, was sworn in March 2, 1962, succeeding Sir Oliver Goonetilleke) represents the British crown. Parliament consists of a House of Representatives of 151 elected members and 6 additional members nominated by the governor general; and a Senate of 30 members, half of whom are elected by the House and half appointed by the governor general. The government is headed by Mrs. Sirimavo R. D. Bandaranaike (sworn in as prime minister on July 21, 1960), who holds also the portfolios of defense and external affairs.

Education and Religion.—Nationalization of the educational system was continued in 1961–62. Government and assisted schools (with enrollments), 1960: 8,277 (2,224,804); teacher-training colleges 22 (4,613). Higher education is provided by the University of Ceylon (3,177 students in 1960); Vidyalankara and Vidyodaya Universities; and Ceylon Technical College. Principal religions (1953): Buddhists, 5,209,439; Hindus, 1,610,561; Christians, 724,461; Moslems, 541,506.

Finance.—One rupee equals U.S.$0.21. Government revenue, 1962–63 est.: Rs.1,682 million (Rs.1,611 million in 1961–62); expenditure, Rs.2,173 million (Rs.2,312 million in 1961–62); the deficit (Rs.491 million) was to be met in part by Rs.122 million in foreign aid.

Transportation and Communications.—Roads, 1960–61: 11,848 miles (9,814 motorable); state-owned railways, 898 miles; registered motor vehicles, 136,976 (private cars, 82,576; buses, 6,243). Air Ceylon Limited and five foreign airlines—British Overseas Airways Corporation, Indian Airlines, Qantas Empire Airways, Trans World Airlines, K.L.M. (Royal Dutch Airlines)—serve Ceylon. Telephones, 1960: 35,822.

Economic Indicators.—Gross national product rose by 2.4% in 1961; per capita GNP declined by 0.4%. The government cash deficit (1961) exceeded Rs.400 million for the third successive year. Foreign exchange assets, July 31, 1961: Rs.499.8 million (down Rs.6.9 million from 1960); gross public debt, 1960: Rs.2,230.4 million; notes of the Bank of Ceylon in circulation, Jan. 1, 1961: Rs.644.6 million.

Manufacturing and Mining.—The labor force in 1960–61 included 738,569 members of 576 employees' unions, and 166,190 members of 17 employers' unions. Production of consumer items, 1960–61: cotton piece goods, 24,689 yards; leather manufactures, 12,833 cwt.; coir yarn, 9,406 cwt.; coir fiber, 1,448,412 cwt.; pharmaceutical products, 346 cwt.; electricity production (1960), 301.2 million kw.-hr. Graphite mines (14 in 1960) produced 9,024 export tons; in 1961, gem pits yielded 321,871 carats of precious stones (export value, Rs.2,359,576).

Agriculture.—Tea is Ceylon's most valuable crop; 1961 production, from 587,000 acres: 455.2 million pounds (up 5,000 acres and 20.5 million pounds from 1960). Other chief export crops are rubber (97,276 tons, from 668,213 acres, in 1960); and coconuts (2,043 million nuts, from 1,071,000 acres, in 1959). Rice is the staple cereal; output (crop year 1960–61): 42,011,000 bushels, from 1,434,624 acres.

Foreign Trade.—Exports (including re-exports), 1961 (in millions): Rs.1,732.8 (down Rs.98.8 from 1960), of which Rs.907.5 million went to Commonwealth countries; imports, Rs.1,703.3 (down Rs.256.3 from 1960), producing a surplus (Rs.29.5) for the first time since 1956. Most valuable exports, 1961 (values in millions): tea, 423,339,898 pounds (Rs.1,107.4, up Rs.11.4 from 1960); rubber, 197.6 million pounds (Rs.262.5); coconut products, 1,836,655 cwt. (Rs.106.8); oil seeds, 54,987 tons (Rs. 47.8); tobacco, 395,136 pounds (Rs.0.8). Principal imports (values in millions): rice, 9,232,415 cwt. (Rs. 217.3); wheat flour, 3,408,747 cwt. (Rs.69.5); milk products, 36,168,305 pounds (Rs.56.4); petroleum products, 48,655,728 gallons (Rs.25.5); fish products, 180,912 cwt. (Rs.22.5); fuel oils, 32,631,543 gallons (Rs.18.4).

Events, 1962.—Ceylon's economic difficulties brought on in 1962 the first major crisis to be faced by the ruling Sri Lanka Freedom Party since coming to power two years earlier. The budget for 1962–63 again showed a large deficit (Rs.491 million), which the finance minister, F. R. Dias Bandaranaike, proposed to meet by imposing a sales tax, levies on private economic enterprises, higher import duties, and increased personal taxation. Further government proposals, designed to conserve Ceylon's dwindling foreign monetary reserves by a 25% cut in the subsidized rice ration, aroused nationwide opposition. Facing a divided cabinet and dissension within his own party, Mr. Bandaranaike resigned during a parliamentary debate lasting six weeks. His successor, C. P. de Silva, leader of the House of Representatives, won approval of the budget only after the rice cut and sales tax proposals had been dropped.

From Washington, on May 24, a warning was conveyed to the Ceylon government that its seizure of service stations (for use in distributing Soviet oil), and of storage and ship bunkering facilities belonging to American oil companies, might cause congressional opposition to continued economic aid to Ceylon (totaling about $71 million in the last ten years). A letter from Prime Minister Bandaranaike, delivered to U.S. Ambassador Frances E. Willis on July 14, demanded that the United States stop interfering in Ceylon's internal affairs.

Talduwe Somarama, a Buddhist monk and one of three persons found guilty of assassinating Prime Minister S. W. R. D. Bandaranaike in 1959, was hanged in Colombo on July 6 after his appeal against the death sentence failed. At the opening of a new session of Parliament on July 11 it was announced that a government commission would investigate political aspects of the crime.

Donovan Rowse,
Author and Publicist.

CHAD

Situated in north-central Africa, the Republic of Chad is a vast, sparsely populated state of the French Community. Estimated area, 495,750 square miles; population, 2,680,000 (mid-1961 est.). The population, which is more than 95% rural, consists mainly of Moslem Arabs and Bantu ethnic groups, and includes about 5,000 Europeans, mainly French. The official language is French. Fort-Lamy (1961 est. pop., 93,000) is the capital.

Government.—This former French overseas territory in French Equatorial Africa became independent on Aug. 11, 1960. Legislative power is exercised by a National Assembly of 85 members elected for five-year terms by universal suffrage. The ruling Chad Progressive Party, led by François Tombalbaye, won all of the Assembly's seats in single-list elections on March 4, 1962, after the government dissolved all opposition parties. The Assembly re-elected Tombalbaye as head of state on March 10. (See below, *Events, 1962.*) Chad is a member of the Union of the Republics of Central Africa.

Education and Religion.—School enrollment, 1959: 55,446 (6% of the school-age population), including: primary pupils, 53,973; secondary, 1,120; technical, 353. Low school attendance is caused by the small urban population, the vast distances and lack of transport, and the resistance by the Arab population to schools which do not offer instruction in Arabic or the Koran. A governmental program to provide primary-school training for most children within 15 years was begun in 1960. About 55% of the population is Christian; 45% is Moslem.

Transportation.—The landlocked country has no railroads. Roads total 18,600 miles, including about 500 miles of all-weather roads. The main waterway, the Chari River, is navigable for only 3 to 4 months each year. External trade passes through the river network of the Central African Republic, and through ports in Cameroun, Congo Republic, and Nigeria. Chad's principal airport is at Fort-Lamy.

Production.—Over 90% of the population is engaged in farming and livestock raising. Chief cash crops: cotton (about 100,000 metric tons produced in 1961) and peanuts; subsistence crops: millet, rice, sweet potatoes and yams, cassava, corn, beans, and dates. Principal products (1961): cotton fiber, 34,790 metric tons; cottonseed oil, 420,000 liters; peanut oil, 335,000 liters; dressed meat, 7,793 metric tons; fuel wood, 3 million cubic meters; bricks and tiles, 24,000 metric tons; and electric power, 8.9 million kw.-hr. Number of livestock (1960 est.): cattle, 4 million; sheep, 4.5 million. Hides and skins exported (1960): 540,850 pieces.

Foreign Trade.—Recorded exports, 1961: 5,293 million francs CFA (up 60% from 1960); imports, 6,253 million (up less than 1%; 246.85 francs CFA equal the U.S. dollar). Chief exports (in million francs CFA, 1961): cotton, 4,229; meat, 325; livestock, 297; and hides and skins, 227. Principal imports: vehicles, petroleum products, machinery, and cotton fabrics. France is the country's chief trading partner.

Events, 1962.—The Republic of Chad established a more authoritarian government by adopting one-party rule during the year. The head of state, François Tombalbaye, dissolved the African National Party (which had held 14 seats in the outgoing National Assembly) and other opposition groups in January on the grounds that they were not "constructive" and were causing confusion and anarchy. His ruling Progressive Party (which had held 71 seats in the old Assembly) was the only political group permitted to enter candidates on single "national union" ballots in the elections of March 4. The government's candidates were endorsed by about 80% of the registered electorate and were elected to all 85 seats in the Assembly. Tombalbaye formed a new 14-member cabinet after being re-elected head of state by the Assembly on March 10.

Following a meeting on March 2 with President Ahidjo in Garoua, Cameroun, Tombalbaye announced that a railroad would be built from interior Chad to connect with the port of Douala, Cameroun, in order to provide Chad with an easier outlet to world markets.

CHEMISTRY

Some of the newer and more significant developments in applied and industrial chemistry are discussed in the following article. For medical applications, see Biochemistry; Chemotherapy; and Medicine; for prizes and awards in the field, see Prizes and Awards; and for additional information, see the Index entry, *Chemistry*.

Chemical Industry.—Sales of chemicals and allied products reached a high of $29.8 billion in 1961, 7.7% above 1960, and were estimated to have moved up to a new sales record of approximately $33 billion for 1962, an increase of 10% over 1961, according to *Chemical and Engineering News*. Monthly chemical sales touched a new high of $3 billion for May 1962, before adjustment for seasonal variations. There were 846,000 employees in the industry in 1962, while total employees had averaged 830,200 in 1961.

The estimated 1962 production of the major heavy chemicals, in millions of short tons, was: sulfuric acid, 19.0; sodium hydroxide, 5.3; chlorine, 4.9; sodium carbonate, 4.8; ammonia, 5.5; nitric acid, 3.5; hydrochloric acid, 1.0; and sodium sulfate, 1.3. The production of carbon dioxide was reported at 1 million tons, while that of oxygen was estimated at 95 million cubic feet, and that of hydrogen at 69 billion cubic feet.

In organic production, solid, synthetic, surface-active agents more than compensated for the drop

in soaps. Sales of the new polypropylene plastics more than doubled, although they were still small in comparison with polyethylene. Production of the chief synthetic organic products reached 56 billion pounds in 1961, including, in billions of pounds: intermediates, 10.3; plastics (synthetic resins), 6.7; synthetic rubbers, 3.0; methanol, 2.0; surface-active agents, largely detergents, 1.7; and acetic anhydride, 1.3.

Metals.—Tin is being used to replace chromium in cast iron for engine blocks, resulting in a gain in average and uniform hardness, tensile strength, and modulus of elasticity. The amount of tin used is not over 0.08%, electrolytically refined and very pure. This small proportion of tin converts ferrite to pearlite, the microstructure of which is needed to improve the wearing properties of iron. Tin is also regarded as helping to form better graphite nodules in nodular iron. It also eliminates carbides in castings, and produces no increase in brittleness. The effect of harder engine bores is offset by traces

ARGONNE NATIONAL LABORATORY

A chemical reaction previously thought impossible was reported in 1962—combination of the gas xenon and fluorine to form xenon tetrafluoride, crystals of which are shown.

of vanadium in iron piston rings, and the combination of these bores and rings greatly increases engine life.

Addition of 10 to 60% of zirconium boride to chromium in electrodeposited coatings on rocket nozzles gives greatly increased resistance to temperatures of the order of 6000° to 6500°F. The boride is added to an ordinary chromium plating solution, and coatings up to 0.02 inch are deposited on such metals as molybdenum and tantalum. The process is easily controlled, adaptable to any size or shape, as well as to different environments, does not require machining, and permits coating of many parts at the same time. Uncoated molybdenum lasts only four seconds in a flame temperature of 6000°F.; coated with chromium alone, 18 seconds; but with the composite coating, the surface lasts for 35 minutes. Graphite is similarly protected.

The heat-resistant properties of metals have been greatly extended by uniform dispersions of fine, hard particles, both within and between grains. The first commercial product is made by introducing thorium-oxide particles in nickel so that strength is retained up to 2400°F., compared with 1800°F. for superalloys of this metal. The product has several other very desirable properties. Instead of dissolving hardening particles in the molten metal, a metal-salt solution is mixed with colloidal thorium oxide and ammonium hydroxide-carbonate. The filtered and dried product is pulverized and reduced by heating in the presence of hydrogen. Compression and sintering give a material that can be extruded or machined. A number of other elements can be upgraded in the same way. An immediate use in jet engines is expected.

Copper surfaces can be joined at 400°F. by carrying out the operation in space-simulation chambers, thereby eliminating the need for temperatures of nearly 2000°F. and the use of copper rod and flux in the welding of copper, or silver in brazing, as well as forging the joints to add strength. Under these reduced pressures, equivalent to those 500 miles above the earth, clean copper plates are welded in a few minutes. (See also IRON AND STEEL; METALLURGY; MINING.)

Inorganic Chemistry.—Forecasts of demands for propellants in space vehicles indicate that the years 1961–65, consumption of liquid hydrogen will increase 21-fold to 125 million pounds per year, while liquid oxygen will have a 6-fold increase. An increase of hydrocarbon propellant fuel from 3.2 to 27 million gallons is small in comparison with annual motor fuel production of the order of 1.6 billion barrels of 42 gallons per barrel. Inactive nitrogen and helium gases are employed as propellant pressurants and precoolants, and their production does not present the problems that confront the hydrogen and oxygen industries.

An underground storage area in the Cliffside gas field in the Texas Panhandle is to receive 62.5 billion cubic feet of helium over a period of 22 years. The helium will be produced by 5 privately owned plants by extraction from natural gas, with another 15 billion cubic feet from Bureau of Mines plants. It is estimated that all needs of helium until 1985 will be met with this supply, and that 52 billion cubic feet will be left in storage. The larger part of helium goes into government operations, and doubling its price to pay for storage may result in the substitution of argon in welding operations.

The inert or noble gases in group Zero or VIII-A of the periodic table (helium, neon, argon, krypton, xenon, and radon) have been believed incapable of chemical combination because their electron shells are filled. During 1962 a chemical reaction of xenon with platinum hexafluoride vapor, forming a yellow powder, probably xenon-platinum hexafluoride, was reported from the University of British Columbia. This led to experiments at the Argonne National Laboratory of the Atomic Energy Commission, in which a mixture of xenon and fluorine gases in a sealed nickel container was heated to 400°C. for an hour and then cooled to −78°C., crystallizing as a stable, colorless compound, xenon tetrafluoride (XeF_4). Photochemical production was also achieved by irradiating xenon and fluorine gases in silica vessels at room temperature with mercury arc light. A more volatile xenon difluoride (XeF_2), xenon oxyfluorides, and a radon fluoride compound have also been observed. Xenon tetrafluoride samples show no signs of reaction or decomposition after six weeks at room temperature in Pyrex vessels. This research knits these no longer isolated and inert elements more closely with the rest of the periodic table and provides new reactions for chemical bonding explanation.

In an emergency, a housewife with a flowerpot filled with clay, or even ordinary soil, paper towels, and commercial bleach, can filter out the larger

part of radioactive fallout accumulated in water. One ounce of clay will remove as much as 90% of strontium-90 and a greater proportion of cesium-137 from a gallon of water. The clay also provides a convenient method for disposing of collected radioactive material.

Inorganic foams of high heat resistance continue to be developed. The most recent, a silica product still in development, is applied as a slurry which can be sprayed, poured, or troweled. It contains a blowing agent which forms a rigid foam in 20 minutes, and is cured in a day. It is used in the protection of structural steel and resists temperatures up to 2000°F. Inorganic foams are produced by blowing gas into a molten mass or including chemicals which volatilize in the melt. Cold-blowing employs a slurry and a reacting chemical as the blowing agent. Hollow spheres of many kinds can be bonded by material of this or other composition. Both open and closed types are made, the former being permeable to gases, and the other impermeable. A great variety of materials may be used as foams, including metals, oxides, and carbides.

Glass and Ceramics.—Glass that can be bent and twisted without breaking, and that is five times stronger than any other glass ever made, is produced by what is known as chemical strengthening. A number of special glass compositions are available as starting materials, and at least a dozen different methods of chemical strengthening are used. Two of these methods involve the formation of transparent, polycrystalline layers within the surface of glasses. The crystalline skin cools as it expands, while the shrinking of the internal glass induces a very high compression of the skin, thus producing a material of great strength. The surface of these glasses remains a true glass or a glass ceramic. Glass rods made by this process have flexural strengths up to 100,000 pounds per square inch. Sheets of glass 0.1 inch thick have been flexed 1,000 times to an arc with a radius of 30 inches without breaking, and cups of the new glass have been dropped 100 feet onto a steel plate without damage.

A combination of ceramic foams in a honeycomb structure of superalloys makes an extremely efficient heat shield for space vehicles, capable of withstanding temperatures up to 3400°F. With proper ablating materials that are gradually removed before the underlying metals are reached, the limit of 5000°F. is expected to be attained. The ceramic foams can be processed below 1000°F. to avoid damage to metal components. A typical formula for the alumina foam contains alumina, alumina hydrate, carbon powder, aluminum powder, phosphoric acid, and water. Hydrogen and steam from the reaction produce the foam. Density of the foams may be controlled by curing techniques. The honeycomb is made of stainless steel, nickel alloys, and, in some cases, beryllium. Lightweight, fibrous insulating material is packed into the lower part of the honeycomb structure, with the foamed insulation above. (See also CERAMICS.)

Electrochemistry.—Since diffusion exchange of cations is fairly slow, strontium-90 and cesium-137 may be removed from milk by a process of electrodialysis. Alternate compartments are filled with milk, the others with a salt solution which has the same ratio of positive ions. The compartment walls are made of membranes with very small pore diameters, in order to prevent the passage of low-molecular-weight sugars and other materials of biological origin. Several hundred membranes may operate between platinum-clad, titanium electrodes. Hydrogen and oxygen are liberated at the electrodes, while a separate electrolyte is circulated past them. As much as 90% of strontium-90 is removed at a cost of about 2 cents a gallon. The radioactive strontium may be recovered as an insoluble sulfate and concentrated for disposal, while the salt solution may be used repeatedly. The hydrogen ion is adjusted by inexpensive acids, which are neutralized by sodium carbonate after the strontium has been removed.

A fuel cell is to replace an ordinary battery and a mechanical power unit to furnish electrical power on spacecraft. The fuel cell will deliver a little under 2 kw. of power. The power unit is made up of a number of ion-exchange-membrane cells, the membrane being made of plastics. Hydrogen and oxygen are supplied as gases, but are stored as liquids. Per pound of system weight, this equipment surpasses conventional batteries. A pint of water suitable for drinking is made for each kilowatt-hour produced.

Organic Chemistry.—An organometallic derivative of tin, made up of butyl groups, tin, and oxygen, with powerful antimicrobial action, is being used in water treatment and in the manufacture of marine paints and germicides. A very pure tin tetrachloride is reacted with butyl magnesium chloride, and distillation separates the desired product from other compounds. It does not settle out in antifouling paints, does not corrode steel or aluminum, and forms a clear coating. It may also carry pigments. Bubbles of air and the fungicide released under a ship's hull give the protection needed in port.

E. I. DU PONT DE NEMOURS AND CO.

Armalon fabric, coated with gold and resistant to chemical reactions and extreme heat, is used in protective clothing.

Long-chain, primary alcohols are now being made by the reaction of aluminum triethyl with ethylene under pressure. A variety of alkyls are produced, the peak of distribution being shifted by changes in conditions. The aluminum alkyls are oxidized by air. Byproducts are removed by solvents, and the aluminum alkyloxides are converted to alcohols by sulfuric acid, with aluminum sulfate as a byproduct. The processed alcohols containing from 6 to 20 even-numbered carbon atoms are marketed, either individually or as mixtures. Alcohols with an odd number of carbon atoms can be made by starting with aluminum tripropyl, which

has three carbons in each alkyl, but there is no market for this type. Aluminum alkyls made by this process are also used with ethylene and a nickel catalyst to make olefins with a double bond at one end.

Tributyl phosphate, derived from phosphoric acid and petrochemicals, is proposed as a solvent for the recovery of iron oxide and sulfuric acid from the pickle liquors of the steel industry. The usual method of disposal of the highly acidic solution is neutralization with lime. In the extraction process utilizing tributyl phosphate, calcium thiocyanate is added to the pickle liquor to form a complex containing the iron. This is then treated with a 25% solution of the phosphate in kerosine in which the iron-bearing material is soluble. The final product is the magnetic oxide of iron, which re-enters the steel plant. The solvent is recovered, the sulfuric acid is used again in the pickling operation, and gypsum is a byproduct.

Cellulose polymer molecules are made up of noncrystalline (or amorphous) regions and crystalline regions. Hot dilute hydrochloric acid hydrolyzes the amorphous portions, leaving a microcrystalline cellulose. Spray-drying yields a material that gives sharp X-ray diffraction-band lines. These crystallites have molecular weights of 30,000 to 50,000, with less than 500 parts per million of contaminants. The material has potential uses as a vehicle for antibiotics; a component of low-calorie dietetic foods; an additive for converting oils, fats, and such foods as cheese and honey to free-flowing powders; and industrial applications in pigment vehicles, coating for paper and fabrics, and raw material for other cellulose derivatives.

Petroleum.—Fluidized silica-alumina catalyst beds of catalytic crackers become contaminated with such metals as nickel, iron, vanadium, and sodium from the off-gas feedstocks. The result is that the amount of coke accumulating on the catalyst increases, as well as hydrogen and light oils in the product, at the expense of gasoline and heating oils. The contaminating metals are held on the surface in the form of complex organic derivatives that are very difficult to remove or render ineffective. Decontamination of the catalyst is based on a strong cationic-exchange resin. A portion of the catalyst is withdrawn and mixed in a water slurry with the resin, which has a greater affinity for the metals than does the catalyst. The resin and catalyst are separated on the basis of their relative densities. The resin is regenerated with acid and a demineralized water wash. The decontaminated catalyst has the same coke-producing factor as fresh catalyst, or a ratio of 1.0, as compared with 1.8 before treatment. Without interfering with full-capacity operation, the coke-producing factor of a 5,000-ton catalyst bed was reduced to a value of 1.2 in a period of 48 days.

In an average petroleum refinery, up to 10% of the hydrogen in the crude oil fed to the process is burned as fuel, amounting to as much as 700 to 800 cubic feet per barrel. Now, in a single step, hydrocarbons commonly burned are catalytically converted to hydrogen and carbon. The carbon accumulating on the catalyst is burned off before it is used again. The hydrogen recovered is largely used in the plant to produce motor fuel, but can be made available as needed for ammonia synthesis, or, with carbon monoxide, to produce methanol.

Waste products of the transportation industry —lubricants, diesel oils, hydraulic oils, and quenching oils—are being reprocessed to make a high-grade lubricating oil. It is estimated that engine drainings alone represent a waste of 12 million barrels a year, three fourths of which could be profitably recovered. The recovery process removes polymerized gums, oxidation products, metal traces, carbon deposits, and sludge. The final product of such recovery methods has been treated three times: in the original refining, in the engine, and in the recovery process. The methods used are the same as those by which the crude oil was refined. (See also PETROLEUM.)

Rubber.—The stereoisomeric rubber, *cis*-1,4-polybutadiene, will probably be used to the extent of 100,000 long tons in 1962 in passenger and truck tire treads. From 3 to 8 pounds of the new synthetic rubber are used per tire. At present the polybutadiene constitutes not more than 50% of treads, but tests are being carried on to determine the suitability of this rubber as the sole rubber in tire treads. It may also be used in the tire carcass, and some is being made into industrial conveyor belts, wire and cable insulation, and shoe soles and heels. The cost of the new rubber is slightly over 30 cents per pound, which is higher by 7 cents than styrene-butadiene material, and 3 to 4 cents higher than natural rubber.

A special grade of carbon black with small and compact particles linked in chains is making possible the compounding of such stereospecific rubbers as *cis*-1,4-polybutadiene and ethylene-propylene polymers in proportions up to 100%. Abrasion resistance of 100% polybutadiene rubber is increased so that abrasive loss drops by 40%. Instead of adding the carbon black after the rubber and compounding oil have been mixed, all three are charged together into the mixer.

Cracking in automobile tires is caused by high concentrations of ozone. Synthetic rubber which offers high resistance to this effect is being made by compounding a cyclic diolefin and isoprene with butyl rubber. Isobutylene copolymerizes with cyclopentadiene very rapidly, but isoprene permits the advantages of the two to be combined in a single elastomer. Variation in the amounts of the two diolefins employed with isobutylene controls both unsaturation and molecular weight. The new tripolymer gives excellent vulcanizates. Butyl rubber is 80 times more sensitive to ozone than the rubber made with 1% cyclopentadiene and 2% isoprene. One explanation of the antiozone properties of the rubber is that breaking of the double bond of ozone does not break the chains, as it does with isoprene.

Wooden cooling towers are now being effectively protected by a very thin coating of isoprene, the first synthetic rubber developed. The rubber is applied as a mixture, with xylene making up one third of the total. Tests extending over 16 months on a tower handling 10,000 gallons per minute showed no fungal decay. The isoprene coating protects against the decay resulting from failure of chemicals to penetrate wood completely and the spreading of flame in case of fire. (See also RUBBER.)

Plastics.—Large increases in manufacturing capacity of two important isocyanates—polymethylene polyphenylisocyanate and toluene diisocyanate —indicate probable corresponding increases in the production of urethane foams. These are made from a variety of polyesters and other polyhydroxy compounds. Both flexible and rigid foams are manufactured, but the rigid type appears to be in greater demand, largely for refrigerator insulation, panels for home construction, transportation equipment, and industrial installations.

Urethane foam may be sprayed on brick to insulate a house, eliminating stud construction. The foam completely seals so that no air can seep into the house through joints; and the rigid foam adds structural strength to the brick walls.

The blowing agents used in urethane foams are now fluorocarbons, which gasify. Their use represents a considerable saving over the old method of using an excess of isocyanate, which reacts with water to form carbon dioxide. The fluorocarbons are more than three times cheaper than isocyanates.

Elastic fibers for foundation garments consist primarily of covered synthetic-rubber thread and a bare filament composed mainly of polyurethane. Rubber is a monofilament, while the urethane product is made up of several filaments combined in a single fiber with bridging between the untwisted filaments. This polymer is made up of hard and soft segments, the soft portions being responsible for elasticity, and the hard parts serving to tie the chains together, to inhibit excessive flow under tension, and to cause the fiber to snap back readily when released. The urethane fabrics can be dry-cleaned with conventional solvents.

The highly fluorinated hydrocarbon plastic, Teflon, metallized with 24-karat gold by vacuum deposition, is used in protective clothing worn by workers subjected for very short intervals to high temperatures, and also by those working with dangerous chemicals such as rocket fuels. This metallized fabric is inert to all known chemicals and can resist a flash temperature of 3000°F., exposure to 1000°F. for one minute, and 500°F. for still longer periods. (See also PLASTICS.)

Fluidized-Bed Process.—A deep bed of finely divided solids stirred by oil vapors is the basis of the process known as fluidized-bed catalytic cracking, which accounts for a considerable part of motor fuel production. This technique has been widely adapted to many other processes, including roasting of a variety of sulfide ores; high-temperature calcination of limestone, phosphate rock, and clay; and drying of coal fines, limestone, shale, cement rock, sand, plastics, chemicals, and food constituents. Chemical reactions such as production of phthalic anhydride, dextrin from starch, and chlorination of titanium dioxide use fluidized-bed techniques. Other recent uses of this method are incineration of organic wastes, removal of fluorine from phosphate rock used in animal feeds, calcination of precipitated calcium carbonate sludges, and production of cement clinker.

W. T. READ,
Consulting Chemist.

CHEMOTHERAPY

A number of therapeutic agents have appeared during 1962 which have materially aided in man's continuing fight against disease.

Synthetic Penicillins.—Two new synthetic penicillins have been added to the growing list of antibiotics effective in the treatment of Gram-positive bacterial infections. These are Prostaphlin (5-methyl-3-phenyl-4-isoxazolyl penicillin) and Rixapen (3, 4-dichloro-α-methoxybenzyl penicillin). Prostaphlin has been noted to be resistant in vitro to the inactivator of penicillin, penicillinase. It has been claimed to be more effective than other synthetic penicillins against the common bacterial infections of man. In human beings it has been effective in bacterial infections not responding to other drugs. It is reported to be efficacious when given either orally or parenterally in therapy of serious systemic, penicillin-resistant, staphylococcal infections. Rixapen, after oral administration, seems to give higher peak levels than either penicillin V or other synthetic penicillins. It is reported to give more sustained blood levels than other penicillins.

Sulfamoxole.—This compound is a new sulfonamide with the chemical name N′-(4, 5-dimethyl-2-oxazolyl)-sulfanilamide. It is claimed to show generally a greater effect against bacterial infections due to the Gram-positive organisms than against those due to the Gram-negative strains. The response was good in approximately 70 percent of more than 1,000 patients treated clinically. In approximately 150 pediatric patients treated, a good response in 77 percent was observed. On the whole the drug was well tolerated, but the usual side effects noted for many of the more common sulfonamides were described. These included crystalluria, hematuria, rashes, and nausea.

Fucidin.—A new antibiotic isolated from *Fusidium coccineum* has been described as effective in the test tube against the common Gram-positive organisms, such as staphylococci, streptococci, and diplococci, as well as against the spore-forming *Clostridium tetani* and the acid-fast *Mycobacterium tuberculosis*. It seems to be inactive against Gram-negative rods and fungi. No cross resistance to other known antibiotics has been observed with fucidin, but resistance to the antibiotic in vitro is easily induced. The antibiotic is well tolerated in mice and rats. When tested in human beings it was found to be well absorbed orally, and has been noted to accumulate in the blood. It is excreted in the feces and not in the urine. The investigators believe that not only is fucidin active in the treatment of Gram-positive bacterial infections but, in addition, results in a more rapid healing of lesions.

IDU (Stoxil).—IDU is probably the first real breakthrough in the therapy of virus diseases. Chemically IDU is 5-iodo-2′-deoxyuridine. In animal experiments it was noted that rabbit cornea infected with herpes-simplex virus and treated before infection or 12 hours after infection did not develop definite herpetic lesions. Treatment started as late as 24 hours or longer after infection still resulted in clearance of the infection. Preliminary experiments in the clinic have shown more than a suggestion that similar improvement occurs in humans suffering from herpetic keratitis and treated with IDU.

Famophos.—Parasitic infections still remain significant in the economy of the world. Famophos, which is chemically O-O-dimethyl-O,p-(dimethyl sulfamoyl)phenylphosphorothioate, has been found effective in well-tolerated doses in a number of parasitic infections of lambs.

Thiabendazole.—Chemically 2-(4′thiazolyl)benzimidazole, this drug seems to have a rather broad spectrum in parasitic diseases of animals. In lambs it has been found 93–100 percent effective in removal of haemonchus, ostertagia, trichostrongylus, cooperia and nematodirus. In horses it is effective in completely removing mature small strongyls, as well as immature large strongyls. It is also active in the removal of mature pinworms. In swine it is the first compound to have been shown to kill trichinae in the muscle of the host. In cattle it is highly effective against fourth-stage larvae of the species of trichostrongylus and cooperia.

Monopar.—The parasitic infections of humans still play an important role in world public health problems. The one major drug described during the year 1962 was Monopar or stilbazium iodide. This drug has been noted to have significant activity against infections with *Enterobius vermicularis, Ascaris lumbricoides, Trichuris trichiura,* and *Strongyloides stercoralis*. It is claimed that no reactions have been noted to the drug, including no significant changes in urinalysis or hemograms.

CHICAGO

Second most populous city in the United States and the center of the nation's third most populous standard metropolitan area, Chicago, Ill., covers a land area of 224.2 square miles. The population (1960) of the city is 3,550,404, of which 812,637 (22.9%) are Negroes.[1] The six counties making up the metropolitan area (Cook, Lake, Du Page, Kane, McHenry, and Will) have a population of 6,220,913.

The city is governed by a mayor (since 1955, Richard J. Daley, Democrat) and a City Council of 50 aldermen elected on nonpartisan ballots representing city wards. All terms expire in April 1963.

Statistical information for the Chicago area in 1962: Total bonded indebtedness for six major governments serving the city, $726 million; for Chicago alone, $297.5 million. Assessed valuation within Chicago, $10.45 billion. For first eight months of 1962: steel production, 12,935,000 tons; families on relief (Cook County, average), 26,684; building permits (Chicago), 13,859.

A five-year dispute between the Chicago and Northwestern Railway and the AFL-CIO Order of Railroad Telegraphers erupted in a strike in 1962. In April, President Kennedy appointed an emergency fact-finding board, thereby delaying the walkout. Negotiations broke off in August, however, and on August 30 approximately 1,000 telegraphers struck, bringing operations to a standstill. Following an appeal by the president, the stoppage ended on October 1. The critical issue in dispute, the right of the railroad to dismiss telegraphers whose jobs have been rendered unnecessary by automation, was submitted to binding arbitration. In a decision that is likely to have significance for the national economy, the arbitrator ruled on October 9 in favor of the right of management to eliminate the jobs.

Demonstrations against alleged segregation in off-campus student housing were staged in January and February by University of Chicago students, who charged that the university operated 125 segregated apartment houses. The university replied that only 12 of 55 were segregated, and that it was seeking to create a "stable interracial community" by "stages."

In February, the National Association for the Advancement of Colored People included Chicago (and suburban Maywood) in a list of 23 non-Southern communities with some form of segregated schooling. On July 31, however, U.S. District Judge Julius J. Hoffman dismissed an anti-segregation suit against the Chicago Board of Education on grounds that all administrative remedies had not been exhausted. Later, the board and the superintendent agreed to a program that will permit children in overcrowded schools (largely Negro) to transfer to undercrowded schools within four miles. Transportation was not to be furnished by the city, however.

At the April 10 primary election, six bond issues totaling $66 million, and strongly supported by the city administration, were defeated decisively. The bonds would have provided funds for urban renewal and other city improvements.

Billy Graham, the evangelist, conducted a 19-day evangelical crusade ending June 17; more than 700,000 persons attended. Earlier, theologist Karl Barth delivered three lectures at the University of Chicago, which held its first special convocation since 1949 to award Barth an honorary degree.

[1] The Negro population is growing at a much more rapid rate than the white population, and in 1962 the Population Research and Training Center of the University of Chicago estimated that 48% of the city's population would be Negro by 1990.

The Chicago Museum of National History welcomed its 50 millionth visitor on July 29. A gift of $500,000 was made to the Chicago Art Institute by its president, William M. Blair, and Mrs. Blair.

GILBERT Y. STEINER,

CHILDREN AND YOUTH

The following article reviews current social and economic developments in the field of children and youth under two headings: (1) Child Welfare; and (2) Youth and Work. For additional and related information, see the articles CRIME—*Delinquency and Crime Prevention;* EDUCATION; PEDIATRICS; SOCIAL SECURITY; SOCIAL WELFARE; UNITED NATIONS EDUCATIONAL, SCIENTIFIC AND CULTURAL ORGANIZATION; WORLD HEALTH ORGANIZATION; and the Index entry, *Child Welfare.*

CHILD WELFARE

The world's child welfare needs and resources in 1962 claimed the attention of an ever-increasing number of national governments, especially those recently changed from colonial to self-governing status. These nations, mostly without substantial economic structures and with many citizens still more aware of tribal than national loyalties, were in need of help from the United Nations and from the more developed countries.

International Services.—Many measures in behalf of children were taken in 1962 by the United Nations and its specialized agencies. Proposals for a concerted attack on the age-old problems of poverty, ignorance, and disease were submitted to the UN Economic and Social Council on June 14 by Acting Secretary General U Thant. Also in June the Executive Board of the UN Children's Fund (UNICEF) affirmed a long-term policy for children in the "Decade of Development," the 1960's. Complicating factors included the rapid increase in population, breakdown of traditions and cultures, a rising tide of industrialization, and increased migration from rural to urban areas. This migration, so harmful to many children, usually ended in the slums of overcrowded cities. It has been about three times as great in Asia as in Europe and the United States, and about four times as great in Africa, and has made assistance to child and family well-being increasingly necessary.

In April 1962 the Economic and Social Council endorsed a three-year, $100 million world food program under the auspices of the United Nations and the Food and Agriculture Organization (FAO), in which that amount would be voluntarily contributed by United Nations members, to include surplus foods, services (especially shipping), and cash. (See also FOOD SUPPLY.)

Increasingly the nations in greatest need have seen the importance of placing education of their children first, even while struggling to provide the physical nurture essential to life and health. With help from the UN Relief and Works Agency for Palestine Refugees (UNRWA), at Ramallah Center in Palestine, 300 refugee girls were being trained as teachers. Several African countries have even gone so far as to plan for universal educa-

tion. In the Republic of the Congo (Léopoldville) many young women are receiving instruction in nursing and midwifery, a development begun several years ago under the maternal- and child-health programs of the World Health Organization (WHO) in India and other Asian countries.

The UNICEF midyear (1962) allocations of funds included $900,000 for projects in education and vocational training. This was part of the $16,500,000 then committed, which also included $1,200,000 for family and child welfare services, $5,873,300 for permanent health services, $5,850,700 for campaigns against mass diseases, and $2,693,000 for nutritional projects.

UNICEF and WHO, continuing their close partnership throughout 1962, could foresee an early cure for 85% of Ghana's 50,000 victims of leprosy, and had further plans for complete eradication of this disease. Mexico's dramatic victory over malaria, now practically eradicated, illustrated the tendency of nations to contribute even more than the United Nations agencies in attaining public-health objectives. In Taiwan, a total of 1 million school children were cured of trachoma through health training.

United States.—The welfare of children in terms of congressional action was advanced in 1962 more than in any one year since passage of the Social Security Act in 1935. The Public Welfare Amendments of 1962 placed a new emphasis on rehabilitation, as reflected in replacement of the term "Aid to Dependent Children" with "Aid and Services to Needy Families with Children." Child welfare services were liberalized and extended to include protection of neglected, abused, and exploited youth; services for prevention of delinquency and treatment of delinquent youth; the care of dependent or neglected children; and the day care of children of employed mothers. In the rush of adjournment, Congress failed to provide the supplemental appropriations for this legislation, but was expected to do so in 1963. The provisions for day care, not previously available, were in recognition of the need to protect children of working mothers, as urged by the National Committee for the Day Care of Children (organized in 1960) and others aware of the serious limitations in existing facilities.

Migrants and their children will benefit from a law enacted by Congress in September 1962 to help state and local health agencies establish in their behalf clinics and other health projects. Federal grants up to $3 million annually were authorized.

The 50th anniversary of the Children's Bureau of the Department of Health, Education, and Welfare was celebrated in Washington, D.C., on April 9, 1962. The founders and other advocates of the bureau, its administrators, and the evolution of its program are identified in *Five Decades of Action for Children*. This history of the bureau and an article by Katherine B. Oettinger, the bureau's chief, "A Half Century of Progress for All Children" in the March–April 1962 issue of *Children*, review the objectives of six successive White House conferences on children and youth, as well as intervening developments. The present dimensions of all child welfare programs in the United States were described statistically in a bureau publication, *Services in Public and Voluntary Child Welfare Programs*.

Refugee children from Cuba, especially unaccompanied teenagers, swarmed into Miami, Fla., during 1961 and 1962. By the summer of 1962 they numbered about 8,000 with 300 more arriving each month. Many other children fleeing to the United States with their families also required relief and rehabilitation. (See also REFUGEES AND DISPLACED PERSONS.)

Canada.—Hearings on various aspects of juvenile delinquency were the responsibility of a departmental committee appointed in January 1962 by the federal minister of justice. The committee's findings to be derived from hearings held across the country were due to be reported late in 1962 or early 1963.

Provisions to increase the number of trained social workers for child welfare and other services were announced in April 1962 by the minister of national health and welfare as part of a new Welfare Grants Program. Training grants, bursaries, scholarships, and fellowships were to be provided, along with funds for teaching and field instruction, staff training, demonstration projects, and research.

Changes in provincial programs included an amendment to the Child Welfare Act of Ontario, permitting juvenile court judges to conduct hearings to determine child neglect, without the child present, whenever it is deemed in his interest; a new Training School Act in New Brunswick, transferring the administration of training schools for delinquent children from the Department of Youth and Welfare to the Department of the Attorney General; and, in Quebec, extension of the statutory school-leaving age to the end of the school year in which a child reaches 15 years of age, instead of the former 14.

HOWARD W. HOPKIRK,
Child Welfare Consultant; Supervisor of Children's Services, Corpus Christi, Texas.

YOUTH AND WORK

In 1962, one million young people under the age of 25 throughout the United States were out of school and out of work. Their rate of unemployment was more than double the national average. For Negro youth, the rate was four times the national figure.

Most of these idle youth were sorely undereducated and untrained at a time when the labor market increasingly called for workers with advanced skills, training, and education. The majority were from the one third of the youth of the United States who drop out of school before high school graduation; some were from the third that does complete high school; and only a few were from the third that goes on to higher education.

The decade of the 1960's was witnessing the largest influx of young job seekers in the nation's history. Coming of working age were 26 million youth born during the post-World War II jump in birth rate—40% more than in the 1950's. At the same time, the needs of industry were undergoing dramatic changes along with the advance of new technology. The sharpest decline in opportunities occurred in precisely those unskilled areas in which the bulk of untrained young people once found their first jobs. The majority of new jobs required at least a high school diploma. Yet, the U.S. Department of Labor estimated that 7,500,000 of the coming surge of young job seekers would not have completed high school.

Congolese girls are receiving instructions in midwifery and nursing from United Nations civilian workers in the Congo.

* 1962 annual averages, projected on basis of data for first nine months. (Source: Bureau of Labor Statistics, U.S. Department of Labor.)

Members of minority groups—even if they had high-school diplomas—were the most handicapped of these youngsters. Not only did they face discrimination in being hired, they were often denied access to training programs, such as apprenticeship, which were prerequisite to becoming skilled craftsmen.

Solutions to these problems, according to the National Committee on Employment of Youth, required large increases in the number of available job opportunities for youth, as well as more and better guidance and training services to make youth more employable in the labor market. Also urgently needed was more precise forecasting on the kinds of skills and training that would be needed and the kinds of jobs that would be available to youth in future years.

The Youth Employment Opportunities Act of 1962, which would launch a youth conservation corps and provide public service employment, was reported favorably by both Senate and House committees, but failed to come up for vote. Renewed support for this legislation was expected in the next Congress. Under the federal Manpower Development and Training Program, enacted in 1962, approximately 25,000 young people, ages 16–21, are to receive job training each year, and youth of 19–21 years of age will be paid training allowances of up to $20 per week.[1]

CHILDREN'S LITERATURE

The evident dissatisfaction among critics of children's books in 1961 continued in 1962, but with more thoughtful articles. In one of the outstanding criticisms, "Seek Original Books, Not Packaged Lookalikes" (New York *Herald Tribune* special supplement, "Children's Books," Nov. 11, 1962), Mary Silva Cosgrove warned: "The time is now . . . to take stock of what is and what should be the future of literature for children. Our future backlists are being made today by those books, sometimes in a series, more often individual ones, that have a distinction of their own. . . ."

Briefly taking stock of a 1962 output marked by expanding commercialism, one finds a few children's books distinguished for their originality. It was a year of poetry—chiefly anthologies, such as *Tom Tiddler's Ground*, edited by the English poet-anthologist Walter de la Mare, and *The Singing and the Gold*, a collection of poems (in translation) from many countries, compiled by Elinor Parker. Some good books appeared in series, notably William L. Shirer's *The Sinking of the Bismarck*, a Landmark Book. And the year saw the continued publishing of paperbacks for ages 8 to 14, led by Kenneth Grahame's classic, *The Wind in the Willows*. Because of the large teen-age reading group, there will undoubtedly be more paperbacks, representing the rich backlists of many publishers.

Picture books for young children were numerous, though few of them were outstanding or original. There was one item which critics seemed to agree had merit: *The Nutshell Library*, four tiny books in a slipcase, with amusing text and pictures by Maurice Sendak. A book that pleased the graphic arts specialists was *Mama, I Wish I Was Snow—Child, You'd Be Very Cold* (a record long title), by Ruth Krauss, illustrated by Ellen Raskin. *Adam's Book of Odd Creatures*, with verse and pictures by Joseph Low, was either liked or disliked—no halfway feelings about it.

There were some pleasant surprises in book illustration. Clement Hurd astonished everyone by using an entirely new technique in a boldly handsome book about two flying fish, *Wingfin and Topple*, written by Evans G. Valens, and in the attractive *Christmas Eve*, by Edith Thacher Hurd. *Henri's Walk to Paris*, by Leonore Klein, designed by Saul Bass, was one of the most original and colorful books. Gene Zion and Margaret Bloy Graham gave children more of a story than they usually get, as well as some amusing pictures, in *The Meanest Squirrel I Ever Met*. Another interesting book, especially in design and pictorial presentation, was *The Emperor and the Drummer Boy*, by Ruth Robbins, with Nicolas Sidjakov's highly stylized illustrations.

There was much activity in the folklore division. Many elaborate folktales poured from the presses, but most were of transient interest. There were, however, good collections of folklore. Outstanding for its beauty of design and its poetic text was Natalia M. Belting's *The Sun Is a Golden Earring*, illustrated by Bernarda Bryson and presenting primitive beliefs about the heavens and the universe. *The Magic Drum*, by W. F. P. Burton, was an excellent collection of tales from central Africa. So was *The King's Drum and Other African Stories*, by Harold Courlander. On Asia, there was *The Golden Stag and Other Folk Tales from India*, selected and retold by Isabel Wyatt. *Thistle and Thyme*, by Sorche Nic Leodhas, was a most attractive book of tales from Scotland. Another folktale of note was *The Golden Seed*, by Maria Konopnicka, adapted by Catharine Fournier, with jewel-like medieval illustrations by Janina Domanska.

Fiction for the early teens was not, in general, strong, though a few books stood out. *Silence Over Dunkerque*, by John Tunis, was thought by many to be his finest book, as well as one of the best about World War II. There were a few

[1] Youth employment in the United States is regulated by three federal acts. The Fair Labor Standards Act sets the minimum age at 14 for employment outside of school hours in nonmanufacturing, at 16 for employment during school hours in interstate commerce, and at 18 for occupations declared hazardous by the secretary of labor. The Public Contracts Act sets the minimum at 16 for boys and at 18 for girls employed in firms supplying goods under federal contract. The Sugar Act sets the minimum age at 14 for employment in cultivating and harvesting sugar beets and cane. State laws vary in both standards and coverage. They govern the ages, hours, and conditions of employment and prohibit certain occupations for minors.

adaptations of adult books, including *The Lion*, by Joseph Kessel, which some found "disturbing," others "dramatic." *The Year of the Falcon*, by Jean George, has been praised by some as a discerning picture of an adolescent coming to maturity. Two fantasies widely noticed were Jane Langton's *The Diamond in the Window*, an extraordinary, occasionally confusing story set in Concord, Mass., and Madeleine L'Engle's science fiction allegory, *A Wrinkle in Time*. Another interesting allegory, on the borderline between literature for children and adults, was P. L. Travers' *The Fox at the Manger*, a well-written Christmas story.

Nonfiction for all ages was omnipresent—it is the trend of the times—with science books too numerous to list in detail. Young people may also read about almost any country, even those that may seem remote from the United States but are strategically located: for example, *Afghanistan*, by Christine Weston, and *Cambodia*, by Ruth Tooze. There were also several books about Africa published in 1962. Noteworthy additions to the Horizon Caravel series were *D-Day: the Invasion of Europe*, by Al Hine, and *Russia in the Time of the Czars*, by Henry Moscow.

There were some excellent history books, led by *The Supreme Court*, the second and timely volume of Gerald Johnson's trilogy on United States government. This book and the first volume, *The Presidency*, are considered most useful and clear in exposition. *The Congress* should follow shortly. For the younger teens, or those not willing to tackle the longer volume, there was a pictorial version of Bruce Catton's *This Hallowed Ground*.

Interesting biographies for girls included Anne Guthrie's *Madame Ambassador: the Life of Vijaya Lakshmi Pandit*, which reflects the spirit of present-day Indian women, though it is noncritical; and *Restless Spirit*, by Miriam Gurko, a discerning life of Edna St. Vincent Millay. For boys (and some girls) were *From the Eagle's Wing*, by Hildegard Hoyt Swift, a biography of John Muir; and *Robert Goddard: Space Pioneer*, by Anne Perkins Dewey.

One art book was outstanding in both content and format: *The Art of Ancient Egypt*, by Shirley Glubok. There was also a revision of a standard work, *Famous Paintings*, by Alice Elizabeth Chase. *The Golden Book of the Renaissance*, a simplified version of the Horizon book, with a revised text by Irwin Shapiro, received approval, though it was mentioned that some pictures could have been better reproduced.

Contributing Editor of "Books for Young People," The Saturday Review.

CHILE

The Republic of Chile is situated on the southwest coast of South America. It has an area of 286,396 square miles (exclusive of its Antarctic claim, and the Juan Fernández, San Félix, San Ambrose, Sala-y-Gómez, and Easter islands) and a population of 7,827,000. Principal cities (1961 pop. est.): Santiago, the capital, 2,001,000; Valparaíso, 269,000; and Concepción, 174,000. Spanish is the official language.

Government.—Under the constitution adopted in 1925, Chile is a unitary state with a government based on a separation of powers. The Congress consists of a Chamber of Deputies (147 members elected for 4-year terms) and a Senate (45 members elected for 8-year terms). After the March 1961 elections, party membership in the Senate (with that in the Chamber of Deputies shown in parentheses) was: Radicals, 13 (40); Liberals, 9 (26); Socialists, 7 (13); Communists, 5 (15); Conservatives, 4 (18); Christian Democrats, 4 (23); National Democrats, 0 (12); and independents, 3 (0). The president (Jorge Alessandri Rodríguez, inaugurated Nov. 3, 1958) is elected for a 6-year term by popular vote and may not succeed himself. The 14-minister cabinet (a coalition of Liberals, Conservatives, and Radicals since August 1961) must respond to questioning on the floor of Congress. The highest judicial organ is the 13-member Supreme Court.

Education and Religion.—The predominant religion is Roman Catholicism, but freedom of worship is constitutionally guaranteed. Public elementary education is free (ages 7–15); private schools function without restriction. Primary schooling is compulsory. Public elementary pupils in 1961 numbered 891,143. Only 3 out of every 100 pupils finish high school. The public University of Chile (12,323 students in 1960) is one of 8 institutions of higher learning.

Finance.—The budget for 1962 was revised upward: revenue, 928,800,000 escudos; expenditures, 1,316,800 escudos (deficit to be covered by 75 million escudos in government bonds, 55 million escudos from local bank credits, 112 million escudos in previously committed foreign credits, a 26 million escudo credit from the West German government and an Alliance for Progress loan of 120 million escudos). Official rate of exchange (November 1962): 1.41 escudos equal U.S.$1; free rate, 2.44. In 1962, Chile owed $120 million in payments to the United States and expected a total of $260 million from the United States in aid. The ordinary budget for 1963 called for expenditures of 925,364,000 escudos and $54.3 million in foreign currencies; the capital budget, 26,163,000 escudos and $44.1 million. The largest source of revenue is customs duties (60.7%), followed by transactions and excise taxes (19.7%), and income tax (11.4%). In 1961 customs receipts totaled 176 million escudos.

Foreign exchange contributed by the United States-owned copper companies (1961): $179.8, including $74 million in taxes. Long-term United States aid commitments as of mid-1962: $219.2 million (Export-Import Bank, $46.4 million; Agency for International Development, $142.7 million; Social Progress Trust Fund, $18.7 million; Food for Peace, $10.4 million; Peace Corps, $1 million).

Transportation and Communication.—All-weather roads total some 26,000 miles, 1,750 of which are paved (including 364 miles paved in 1961). The rail system totals 5,434 miles (all but 1,500 miles publicly owned), exclusive of international lines such as La Paz (Bolivia)-Arica, the trans-Andean route to Mendoza, and the lines to Argentina and Bolivia out of Antofagasta. Eleven international airlines serve Santiago; the major domestic airline is LAN-Chile. Civil aviation traffic for 1961 totaled 398.3 million passenger-kilometers (down 4% from 1960) and 9.5 million ton-kilometers (down 12% from 1960). Telephones in 1961 numbered 193,175 (56% of the total in Santiago).

Economic Indicators.—Per capita national income in 1960: 510 escudos (1957, 538). Unemployment: over 100,000 (8% of working force). Average annual wage received by 1,246,000 workers in 1961: 289.24 escudos. Price indexes (1958 = 100): wholesale (March 1962), 193; consumer (June 1962 for Santiago only), 183.

Manufactures and Minerals.—Manufacturing production (1953 = 100) registered 135 by April 1962 (1961 average, 128). Chief industrial products (metric tons. 1961): coal, 1,692,000 (up 25% from 1960); crude petroleum, 1,207,200 (up 28%); iron ore (approximately 60% metal content), 6,312,000 (up 33%); copper, 501,600 (up 1%); cement, 883,200 (up 6%); pig iron, 285,600 (up 7%); crude steel, 362,400 (down 16%); nitrates, 1,114,000. Other production data for 1961: liquefied gas, 72,000 cubic meters; cotton fabrics, 72.24 million meters (up 7% from 1960); electric power, 4,776 million kw.-hr. (up 8%).

Agriculture.—Crop production for the 1960–61 season (official est. in 100-kilogram quintals): wheat, 11,232,100; potatoes, 8,173,000; sugar beets, 2,391,300; oats, 1,239,300; onions, 1,234,800; barley, 1,032,200; corn, 1,438,800; rice, 1,093,200; beans, 850,200. Meat production, 1962: 245,720 tons; milk, 824,000 tons; butter, 7,500 tons; edible oils, 26,000 tons; wool, 10,400 tons (est.).

Foreign Trade.—Total exports, 1961: $506 million (1960, $488 million); imports, $591 million (1960, $500 million). A member of the Latin American Free Trade Association, Chile ended 1961 with a balance of $67.9 million in her favor. Imports from the United States in 1961: $226.7 million; exports to the United States, $183.8 million. In 1961, 519,000 metric tons of copper were exported. Other principal exports: nitrates, iron ore, fresh fruit, wool, wine, wood products, molybdenum, and steel.

Events, 1962.—The government was forced to abandon unqualified support for the currency in January because of high imports (especially of luxuries), increased travel abroad, and delays in the arrival of expected foreign loans and investments. On October 15 the escudo was devalued 34% in the controlled market, to approximately U.S.$0.72. In the uncontrolled (brokers') market, the escudo sank rapidly to U.S.$0.45.

EASTFOTO

Militiamen march in Peking on October 1, the 13th anniversary of the founding of the People's Republic of China.

Long-term credits from the United States and international institutions were slow to materialize, forcing expensive short-term borrowing; of the $65 million received from the United States from July 1960 to January 1962, $48 million were required to service existing debt. Wage increases added to inflationary pressure; confidence in the administration's fiscal policies ebbed to the point of systematic liquidation of ready assets by individuals in order to convert escudos into hard currencies (especially dollars). Numerous import, export, and price controls were instituted or altered during 1962 in a generally unsuccessful effort to stem inflation and the withdrawal of capital. As of July, total foreign exchange reserves had deteriorated to $51.3 million. In February the minimum monthly salary for Santiago was raised 5% by law (50% of the previous year's cost-of-living rise) to 80.91 escudos.

In August the fifth Chile–United States agricultural surplus loan ($19.6 million) was signed, making available wheat worth $10.9 million, and raw cotton, $3.5 million, among other commodities. Several Inter-American Bank loans were being put to work (small-farmers' credit, municipal water works, workers' housing, irrigation, the fishing industry, and the splitting up of government farms into individual holdings); $27.1 million had been approved by the beginning of 1962.

A United States economic mission, headed by Alliance for Progress administrator Teodoro Moscoso, flew to Santiago in March in response to Chilean impatience with delays in approval of promised United States funds. A joint communiqué (March 8) announced a United States commitment of $120 million in aid during 1962 and up to $350 million as the United States contribution to the total of $1,035 million in foreign exchange required for the financing of the first five years of Chile's ten-year plan. Nonetheless, at the close of the year, dissatisfaction over "red tape" and United States insistence on prior reforms was running high, as was criticism of internal squabbling and corruption.

President Alessandri discussed Chilean participation in the Alliance for Progress program with President Kennedy, during the former's one-week visit to the United States in mid-December.

In June the Organization of American States Committee of Experts pointed out the inadequacies of proposed tax and land reforms. Opposition in Congress to even this weak legislation led President Alessandri to urge changes in the constitution. The long-awaited agrarian reform bill again passed both houses of the Congress in November, after being sent back in October by the president with a number of changes.

Bolivia ruptured diplomatic relations with Chile in April. Chile was completing a dam to divert 49.7% of the waters of the Lauca River, which rises in Chile's parched Tarapacá Province but flows into Bolivia. When negotiations failed, Chile proceeded to begin diversion and Bolivia took her complaint to the Council of the Organization of American States, which, however, agreed unanimously that Chile's actions did not constitute an "act of aggression." Chile offered to submit the question to the International Court of Justice at The Hague.

ROBERT D. HAYTON,
Chairman, Inter-American Affairs Center, Hunter College (City University of New York).

CHINA, Nationalist. See TAIWAN.

CHINA

The most populous and third largest in area of the countries of the world, the People's Republic of China[1] is a Communist-ruled state on the eastern mainland of Asia. Estimated area: 3,691,502 square miles. The population of 716 million (1961 est.) is increasing by about 2% annually—one of the highest rates among the larger nations. The urban population constituted about 14% of the total in 1956. Han Chinese comprise about 94% of the population. Minority groups include the Chuang in the southeast (about 6.5 million); the Hui in the northwest (3.5 million); and Uigur, Yi, Tibetan, Miao, Manchu, Mongolian, and Korean groups. The capital is Peking or Peiping (1958 est. pop., 5,420,000). Other principal cities (with 1957 est. populations): Shanghai, the main seaport (6,900,000); Tientsin (3,220,000); Mukden (2,411,000); Wuhan (2,146,000); Chungking (2,121,000); and Canton (1,840,000).

Government.—Although a constitution adopted in 1954 proclaimed China "a people's democratic state led by the working class," the so-called People's Republic of China is in fact a dictatorship controlled by the leaders of the Chinese Communist Party. Supreme state power is vested by the constitution in the National People's Congress of 1,200 members elected indirectly every four years, but the Congress serves mainly to ratify decisions taken by the Communist Party leadership. An 83-member Standing Committee is the permanent body of the Congress and in practice exercises its authority. Congress elects the chairman of the republic (Liu Shao-ch'i), who is the chief executive officer and titular head of the state. The executive body and highest administrative organ of government is the State Council or cabinet, headed by a premier (Chou En-lai) and comprising 11 deputy premiers, 30 ministers, and a secretary general. A Supreme People's Court and an Office of Supreme People's Procurator General exercise judicial and control functions, respectively. Under the central government at Peking are the 21 provinces, 2 special municipalities (Peking and Shanghai), and 5 autonomous regions (Tibet, Inner Mongolia, Sinkiang-Uigur, Ningsia-Hui, and Kwangsi Chuang).

The Communist Party controls the key posts in the government, armed forces, trade unions, industrial and trade enterprises, communes, and other groups. Mao Tse-

[1] Data given in this article, unless otherwise specified, pertain to the Chinese mainland, or Communist China. For information on Nationalist China, see TAIWAN.

tung, a leader of the Chinese Communist movement since the 1920's and one of the outstanding figures of world communism, is chairman of the top-level Politburo. This 22-member ruling body is elected by the Communist Party Central Committee, which in 1960 consisted of 95 members and 82 alternates. There is also a National Party Congress, which meets annually, and a National Party Conference, which is an extension of the Central Committee and deals with party matters between meetings of the congress. The membership of the Chinese Communist Party was estimated at about 17 million in mid-1961.

Religion.—Although Confucianism, Taoism, and Buddhism have been the principal faiths, antireligious Communist doctrine and the Peking regime's emphasis on group before family life, emancipation of women, and other reforms have weakened the social and cultural matrix of traditional religious attitudes and practices. Religious minorities include some 10 million Muslims in the northwest, nearly 3 million Roman Catholics, and about 700,000 Protestants. The Communist government has severely curtailed the Christian churches in China and has imprisoned or otherwise persecuted Roman Catholic and Protestant missionaries as "agents of imperialism."

Education.—School enrollment in 1958–59 totaled 97.2 million, including 86.4 million primary pupils, 8.5 million secondary students, 1.5 million technical students, and 810,000 students in China's 815 institutions of higher learning (1959–60). The Communist regime claims that three fourths of the population is literate (as compared with less than 20% in 1949) as the result of its vast campaign to increase school enrollment and raise the literacy rate. Some 65 million peasants reportedly attended literacy classes in 1960, and over 13 million workers were enrolled in factory schools. A teacher shortage has hampered educational expansion, and the quality of instruction is often poor. As facilities for graduate study and research are still inadequate, many students study abroad, particularly in the Soviet Union. In line with the country's industrialization efforts, high priority is given to engineering and technical training, and the number of engineers and technicians was reportedly increased from 164,000 in 1952 to 496,000 in 1957. Students are required to perform manual labor while attending school in order to avoid what Peking regards as a dangerous separation between intellectuals and workers. Communist indoctrination proceeds on all levels of instruction.

Finance.—Governmental revenue, 1960: 70.0 billion yuan (54.1 billion in 1959); expenditure, 70.0 billion (52.7 billion); 2.46 yuan equal the U.S. dollar at the official rate. Receipts from state enterprises provided 45.3 billion yuan of total 1960 revenues. Principal expenditures, 1960: economic construction, 42.9 billion yuan; social services, cultural affairs, and education, 8.6 billion; and defense, 5.8 billion. Estimated foreign exchange reserves: $300 million as of Jan. 1, 1961.

Transportation and Communications.—Transport networks (miles, 1960): railways, 24,583; roads, 248,000 (1958); inland waterways, 93,200. A new east-west railroad linking Lanchow with Alma-Ata, USSR (about 1,740 miles) was nearing completion in 1962. Merchant marine (gross registered tons, 1961 est.): 473,000. China's airline, the Civil Aviation Administration of China (CAAC), in 1960 operated scheduled routes aggregating about 23,000 miles to 72 towns and cities, including 8 outside mainland China. Radio receivers: 7,000,000 (1959); television sets, 20,000 (1961).

Industry.—Communist China's failure to issue comprehensive economic statistics for the years 1960 and 1961 indicated that production during both years was severely curtailed because of administrative mismanagement, apathy on the part of workers, and natural catastrophes. The Communist regime announced in October 1961 that the rate of industrial development had been readjusted, but revised industrial goals for 1961 were not made public and new production quotas for 1962 were not set. The government admitted that capital construction of heavy industry had to be reduced drastically in order to concentrate on improving agricultural production. It was announced that a policy of economic "consolidation" would take place in 1961 and 1962 in preparation for the "future expansion of the national economy."

Industrial production reportedly was increased by 18% annually during the first five-year plan (1953–57). The rate of growth during the second five-year plan (1958–1962) was not revealed, but it undoubtedly fell far short of the earlier rate. Chief industrial products and production figures for 1960 (the latest year for which data are available): steel, 18.45 million metric tons; pig iron, 27.5 million metric tons; cotton yarn, 9.0 million bales (400 pounds each); cotton cloth, 7.6 billion meters; chemical fertilizer, 1.98 million metric tons; cement, 12.27 million metric tons (1959); timber, 41.2 million cubic meters (1959); machine tools, 90,000 units; freight cars, 32,000; locomotives, 800; and electricity, 55.5 billion kw.-hr.

China's resources include large deposits of coal, petroleum, iron ore, and other important minerals, although some of these are of low-grade

COMMUNIST CHINESE LEADERS

Mao Tse-tung was born in Shao Shan, Hunan Province, China, on Nov. 19 (?), 1893. He attended schools in his native village and in Hsiang, joined Sun Yat-sen's Revolutionary Army in 1911, and in 1912 resumed his studies, at the Hunan Normal School. He was graduated in 1918 and attended classes at the University of Peking. He was one of the founders of the Chinese Communist Party in Shanghai (1921). After the dissolution of the Kuomintang-Communist alliance in 1927, Mao was named commissar of the Fourth Red Army (1928). He became chairman of the first All-China Congress of Soviets in 1931, the year the group organized the Chinese Soviet Republic. After the Communist victory and the founding of the People's Republic in 1949, Mao served as chairman of the Central Government Council until his resignation on April 27, 1959. He retained the chairmanship of the Communist Party Politburo, the most powerful position in China.

Chou En-lai was born in Hwaiyin, Kiangsu Province, China, in 1898, into a well-educated mandarin family. He was educated in China and Japan, and became associated with left-wing causes while still a student at Nankai University in Tientsin; in 1919 he was arrested for leading an anti-government demonstration. He joined the Chinese Communist Party, founded in 1921 by Mao Tse-tung and others, and worked in Europe in 1920–24, organizing youth groups. Returning to China, he joined Chiang Kai-shek in the Kuomintang-Communist alliance, and, after Chiang's break with the Communists, founded the nucleus of the Red Chinese Army in 1927. Chou rose progressively higher in the Communist ranks during the long civil war with the Nationalist forces, which culminated in a Communist victory and establishment of the People's Republic in 1949. He then became premier and foreign minister of the Communist state, but resigned from the latter post in 1958.

quality. Chief minerals (metric tons, 1960): coal, 450 million; petroleum, 5.5 million; salt, 14.3 million; lead, 70,000; zinc, 60,000; tin concentrates, 21,000. China also produces molybdenum concentrate, mercury, bauxite, magnesite, pyrite gypsum, and phosphate.

Agriculture.—China's so-called "great leap forward" in agriculture was dealt a devastating blow in 1960 and 1961 by severe droughts and floods, as well as by bad planning and management, and the inefficiency of the commune system. The Communist regime admitted that natural calamities had "seriously affected" agricultural production on 148 million acres of land, or over half of the country's cultivated area. Production of grains and other crops in 1960–61 apparently declined so drastically below 1959 levels and planned goals that the government did not issue official statistics on crop output.

As a result of agricultural failures, strict rationing was introduced throughout China in August 1960, and in 1961 the Communist regime invested larger capital outlays in agriculture, transferred millions of industrial workers to farms, decentralized the operations of the country's 24,000 rural communes, and began to develop uncultivated areas in the north and west. Despite these changes, however, the country's crop harvest in 1961 was reportedly little better than in the previous year.

China's agricultural production reportedly increased in value by 25% during the first five-year plan (1953–57), and was valued at 67 billion yuan in 1958. Chief crops (metric tons, 1960 est.): food grains (including rice and potatoes), 170 million; sugarcane, 13.9 million (1959); soybeans, 10.2 million; cottonseed, 4.8 million (1959); cotton fiber, 2.4 million (1959); peanuts, 2.4 million; rapeseed, 900,000; sesame seed, 350,000; tea, 159,000. Livestock (million head, 1959): cattle, 65; pigs, 180; sheep and goats, 114.

Agriculture is based on the operations of production brigades, small units within the communes similar to the collective farms that existed before the massive drive toward forming communes began in late 1958. The brigades own farm implements, machinery, and animals, and are given definite plots of land to cultivate. After the commune system was decentralized in 1961, peasants were again permitted to cultivate private plots of land, raise their own livestock and poultry, and receive payments for work done. The communes exercise a vague supervisory role. (See also below, *The Year 1962 in Communist China.*)

Foreign Trade.—The traditional pattern of Communist China's trade has been to export foodstuffs and to import raw materials and industrial products, but as the result of agricultural failures this pattern was altered radically in 1960 to provide for substantial imports of grains and fewer purchases of industrial goods. About 70% of China's trade in recent years has been with the Soviet Union and other Communist countries. Chinese exports to the Soviet Union in 1961 were valued at an estimated $540 million (down 35% from 1960); imports totaled about $360 million (down 60%). A new Soviet-Chinese trade agreement of April 20, 1962, provided for greater Chinese imports of raw materials and machinery in exchange for exports of nonferrous metal ores and textiles.

Communist China's trade with the non-Communist world in 1961 consisted largely of grain imports, totaling about $350 million, and exports of agricultural products, totaling $100 million (down 20% from 1960). It was announced on March 28, 1962, that China had purchased $75 million worth of wheat from Canada—the largest of six Canadian grain sales to China since 1960. Official trade data for Communist China in 1960 and 1961 were not revealed; total exports in 1959 were valued at about $2.1 billion, and imports, $2.25 billion.

W. R. F.

The Year 1962 in Communist China

The most important developments in the year 1962 were Communist China's border war with India (see below, *Sino-Indian Border War*) and the country's continuing economic crisis.

Economic Developments. *Agricultural Crisis.*—Communist China's economic reverses, which began in 1960, continued into 1962 with no sign of speedy recovery. Agricultural production dropped so sharply that food shortages remained unmitigated throughout the country. Under a severe food-rationing system, malnutrition was common in both urban and rural areas. The decrease in agricultural output had serious effects on both light and heavy industry. Although the Peking regime had stopped issuing statistics to avoid embarrassments, there is no doubt that its economic growth took a big leap backward after ten years of advance.

Communist China's agricultural failures are partly attributable to natural disasters. It was reported that drought seriously damaged China's summer grain crop over an area extending from the northeast to the southwest. Floods also caused vast destruction in the south, especially in the Pearl River Delta. In some areas frost and insect pests joined in causing heavy damage to grain as well as cotton crops.

New Program.—Various measures had been taken by the Chinese Communists to cope with the agricultural crisis. Peasants were urged to plant as many subsidiary agricultural products as possible. In April 1962 the National People's Congress adopted a "ten-task" program, shifting emphasis to agricultural production. Peking had at last decided that past overemphasis on industrial development must be rectified. The new program called for an increase in agricultural production; a retrenchment of capital reconstruction; the rational arrangement of the production of light and heavy industry so that the output of daily necessities would be increased; a shift of urban workers and functionaries to rural productive work; and improvement in the market supply to insure that the supply of commodities would meet demands. In short, the new policy aimed at "an all-round balance between the branches of the national economy in the order of agriculture, light industry, and heavy industry."

In pursuance of this policy Peking on June 6 ordered that capital construction plans be reviewed so as to return unused land to farmers. Within two months of the announcement of the new program more than 20 million people were moved from cities to rural areas to help increase agricultural production.

Overpopulation.—The serious food situation finally forced the Chinese Communists to reverse their policy toward birth control. The problem of overpopulation was raised in 1957 by some liberal economists, but the suggestion of family planning brought strong criticism from some Communist leaders whose orthodox Marxist views rejected any possibility of overpopulation under communism. After three years of agricultural disasters, however, Peking decided to reinstate a discredited policy, hoping that it would help solve the food problem. A campaign for birth control was therefore launched in 1962, somewhat hesitantly at the beginning, but it was pushed with more vigor in

the fall of the year. Newspapers and magazines not only discouraged early marriages, but recommended family planning and gave detailed instructions in the use of contraceptives.

An Optimistic Note.—In an editorial on October 1, *Jenmin Jih Pao,* organ of the Chinese Communist Party, declared that the "most difficult time was over" as China's economy was "getting better day by day." It added that the summer harvest had shown some increase over that of 1961. But although the newspaper asserted that economic difficulties were "only temporary," there was no reiteration of the prediction that China would become an industrial giant within a short time. In fact, Peking began to emphasize that "socialist industrialization" could only be a "gradual process."

Political Developments. *Massive Exodus.*—Continued economic difficulties had serious effects on the morale of the people in Communist China. The prevalent mood of the people was described by some observers as one of "apathy, dejection, despondency, and despair." Of a more violent nature were the rice robberies frequently reported in the cities, including Shanghai and Canton. But the most astounding reaction of the Chinese people to their economic woes was their massive exodus to Hong Kong, the British colony south of Canton. In May 1962, when the influx became the heaviest, about 15,000 Chinese evaded the British border patrols and made their way into the colony. An estimated 60,000 refugees entered Hong Kong in the first five months of 1962, and about the same number crossing the border were returned to China by the Hong Kong police in the first three weeks of May.

Speculation was rife as to the motive of the Chinese Communists in permitting the massive exodus. The sudden relaxation of Communist vigilance along the 14-mile frontier in May was considered unusual. Was it the aim of Peking to embarrass the Hong Kong government and the free world—the former being forced to send back the refugees while the latter looked on helplessly? A more reasonable explanation seems to be that the Chinese Communists themselves were caught unprepared by the sudden massive migration. It appeared that at first they were inclined to let the people go to Hong Kong in order to help relieve the acute food shortage in the nearby areas. As the migration became a stampede, the Communists were for some time undecided as to what to do. Finally they seemed to realize that the surge of refugees from China, if not stopped, would signify to the world the discontent of the people and the failure of the Communist regime. Communist China informed Britain on May 28 that she had taken note of the situation and that she believed the exodus of refugees would end quickly. Apparently the Chinese border guards had taken action, for the flow of refugees fell abruptly to a trickle on May 25.

National People's Congress.—Amidst widespread discontent and rising criticism of the government for failing to solve the economic problem, the National People's Congress, which had not met the preceding year, convened in March 1962. The session of the Congress was shrouded in secrecy, but it was known that China's economic crisis had set off bitter policy debates in its meetings.

After a three-week closed session, the Congress finally approved a "ten-task" program presented by Premier Chou En-lai for the adjustment of the national economy. In emphasizing agriculture at the expense of industry, the new program reversed the policy of China's two five-year plans.

UPI

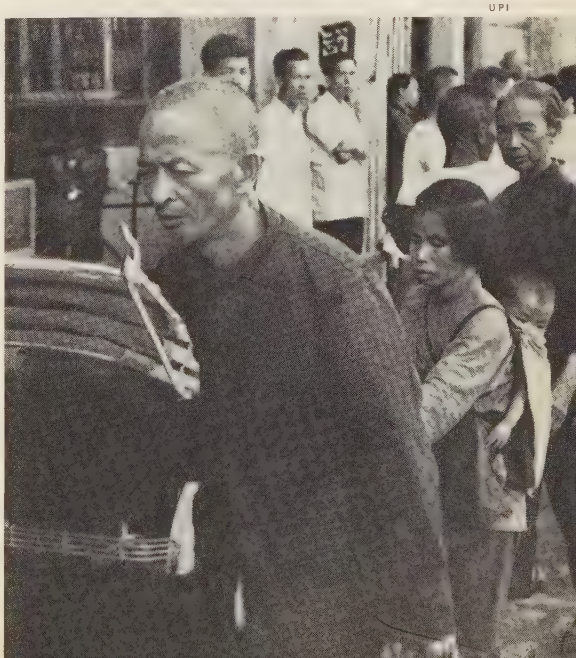
Citizens of Canton, victims of Communist China's persistent food shortage, look for scraps of food in garbage heap.

There was no report of any intention to launch a third five-year plan, although 1962 was the last year of the second five-year plan.

Communist Leadership.—Criticism of the Communist leadership was noted at meetings of the Central Committee of the Chinese Communist Party on September 24–27. It was reported that a "moderate" faction of the party challenged the top leadership by attacking its economic policies. This group had opposed the extremist features of the "big leap forward" economic campaign of 1958, and now advocated more gradual economic expansion. While Mao Tse-tung and his close lieutenants were believed to have regained control of the party, they had to admit the "incompetence of some leading cadres" in reorganizing the Secretariat of the Central Committee. Two mili-

Refugees from Communist China arrive in the Portuguese colony of Macao, October 17. Other refugees fled to Hong Kong.

UPI



tary leaders, Huang Ko-cheng and Tan Cheng, were dismissed from the Secretariat, and three new members—Lu Ting-yi, the party's propaganda chief, Kang Sheng, an alternate member of the Politburo, and Lo Jui-ching, former secret police chief who had succeeded Huang as the army's chief of staff—were elected.

Foreign Relations. *Soviet Union.*—The ideological conflict between Communist China and the Soviet Union, which began in 1958, was intensified at the beginning of 1962 when each side launched slashing attacks on the other, although the criticisms were often couched in abstruse terms and invariably stopped short of referring to the opponent by name. The Russians condemned "people who call themselves Marxist-Leninist" and who yet oppose the "Leninist principle of peaceful coexistence." The Chinese Communists warned that "revisionists" and "reactionaries" had launched anti-Chinese campaigns, "only to meet ignominious bankruptcy time and again."

On January 20, at a time when Moscow branded Albania as an "enemy" country, Premier Chou En-lai declared that Communist China pledged its "everlasting and unbreakable friendship as well as material cooperation" to Albania. Simultaneously, Peking announced that five new economic and technical agreements had been signed with the Albanian government.

In March, when Communist China was preparing for the convocation of the National People's Congress, there were indications that Peking was tuning down its controversy with Moscow. In an address before the Congress on April 16, Chou En-lai proclaimed "unswerving friendship" with the Soviet Union, and called on the Communist world to "unite all forces that can be united" against the United States.

A Soviet economic delegation visited Peking and on April 20 signed a trade agreement with Communist China for 1962. Under the treaty the Soviet Union undertook to supply China with nonferrous metals, petroleum products, industrial chemicals, trucks, scientific instruments, and machinery. In return, Peking agreed to ship to Russia nonferrous metal ores, wool, silk fabrics, handicraft products, and mercury.

These developments, however, must not be interpreted as having healed the rift between Peking and Moscow. Neither side had retreated from the ideological line that gave rise to their disputes. Rather, it was their intention to confine their quarrels to "ideological struggles." In a speech on September 30, Chou En-lai declared that the continued attempts of the "imperialists" and "modern revisionists" to isolate China were futile. He added that the Chinese people "will never submit to any pressure, much less bargain away principles."

United States.—As their ideological conflict with Moscow sharpened, the Chinese Communists hardened their policy of hostility toward the United States. The major newspapers in Peking repeatedly charged that the United States was "actively preparing for an overall nuclear war." In spite of an acute food shortage, Peking announced that it would not accept any food offer from the United States.

In June 1962, Communist China concentrated a large force of troops and jet planes along the Fukien coast, opposite the Nationalist-held offshore islands of Quemoy and Matsu. Peking declared that the move was necessary because Nationalist China was "planning an invasion with United States support and encouragement." To head off a possible crisis over the Taiwan Straits, the United States informed the Chinese ambassador at Warsaw that it would not support any attempt by Nationalist China to land forces on the mainland.

On September 9, Communist China shot down a Chinese Nationalist U-2 aircraft on a reconnaissance mission over eastern China. Peking immediately charged that the flight of the American-made plane was part of the "United States U-2 espionage program against Socialist countries." The United States rejected the protest, pointing out that the ill-fated aircraft was one of the two U-2's obtained by Nationalist China from Lockheed Aircraft Corporation in a "direct sale" in 1960.

Asia.—Japanese trade with Communist China was officially estimated at $80 million in 1962, or an increase of approximately $37 million from the preceding year. In August, Japanese Premier Hayato Ikeda agreed to reorganize the Japan-China Export-Import Association, and indicated that the Japanese government would participate in the task of expanding Japanese trade with Peking. A delegation headed by Kenzo Matsumura, a senior adviser of Japan's ruling Liberal-Democratic Party, went to Peking in September. It was reported that Premier Chou En-lai had agreed to a "gradual and cumulative resumption" of economic and political relations between the two countries. The resultant five-year trade agreement, announced on November 9, provided for a private barter exchange amounting to $104.8 million annually for the period 1963–67.

Communist China took an active role in international politics in Southeast Asia. It maintained an extensive military advisory program in North Vietnam, and was one of the fourteen nations which signed the Declaration and Protocol on the Neutrality of Laos on July 23, 1962. China and Pakistan announced on December 26 their "complete agreement in principle" on China's boundary with Pakistan-controlled Kashmir. On June 3, Communist China announced the expiration of the trade treaty between Tibet and India.

Sino-Indian Border War.—When fighting broke out on the Tibetan border in early October, the Indian Army was ordered to drive the Chinese Communist forces out of the disputed North-East Frontier Agency area. A massive attack was launched by the Chinese on October 20, and the Indians were rapidly pushed back. By November 19 the Chinese forces had thrust deep into northeastern India, outflanking Indian positions at the strategic See La pass and threatening the Assam plains. Simultaneously, Communist Chinese troops captured the outposts of the Chushul airport in the Ladakh area.

Peking on November 21 proclaimed a cease-fire and declared that beginning December 1 the Chinese troops would be withdrawn to positions 12½ miles behind the line of actual control that existed as of Nov. 7, 1959. It called for a similar withdrawal by India and for peaceful negotiations to settle the border dispute. In a reply on December 1, Indian Prime Minister Nehru complained that the line of control in the Ladakh area, as defined by Peking, was along the line established by the Chinese forces after the attacks of October 1962. He proposed instead the restoration of the "status quo" prior to Sept. 8, 1962, as the "necessary atmosphere" for negotiations.

CHRISTIAN SCIENCE

A new radio series and expanded activities for East Asia were featured in the 1962 work of The Mother Church, The First Church of Christ, Scientist, in Boston, Mass.

The Bible Speaks to You, the new weekly radio series, was inaugurated in April 1962 over more than 800 stations in the United States and Canada and over Radio Luxembourg. Spanish and German versions were later broadcast in Buenos Aires and Berlin. It replaces the previous radio-television series, *How Christian Science Heals*.

The Board of Lectureship reported increasing response to Christian Science lectures in Formosa and Japan. Japanese and Indonesian editions of *The Herald of Christian Science* were initiated in 1962, bringing to 11 the number of languages in which the magazine is published. Also translated into Indonesian was *Unity of Good*, the first publication in that language of the writings of Mary Baker Eddy, the discoverer and founder of Christian Science.

Other new translations of Mrs. Eddy's works included the first Russian edition of *Science and Health with Key to the Scriptures*, and a Greek translation of the *Manual* of The Mother Church. Also appearing in 1962 for the first time was the Italian edition of the *Christian Science Quarterly*, which contains the weekly Bible lessons studied by Christian Scientists all over the world.

A significant increase was reported in the circulation among schools and colleges of *The Christian Science Monitor*, the church's international daily newspaper. In July, the *Monitor* for the second time won the Ayer Cup for newspaper typography.

New officers named in 1962 included Bruce G. McCauley of Honolulu, Hawaii, manager of The Christian Science Publishing Society, and Ralph E. Wagers of Chicago, Ill., president of The Mother Church.

CHURCH MEMBERSHIP, U.S.

There were 116,109,929 members of 258 religious bodies in the United States (including Alaska and Hawaii) in 1961, according to the *Yearbook of American Churches for 1963*. This membership represents an increase of 1,660,712 members, or 1.4%, over 1960. Local churches (parishes and congregations) numbered 319,670 in 1961.

Statistics for 84 religious bodies with membership of 50,000 or more (representing about 99% of all members) are shown in the following table.

Total Protestants and non-Protestants	116,109,929[11]

* Mainly for the calendar year 1961 or a fiscal year ending in 1961; figures include Alaska and Hawaii.
[1] 1956. [2] 1959. [3] 1960. [4] 1958. [5] 1951. [6] 1950. [7] 1955. [8] Data not reported; figure shown from *Census of Religious Bodies, 1936* (U.S. Bureau of the Census). [9] Includes membership of the Evangelical Lutheran Church and the United Evangelical Lutheran Church, which merged with the American Lutheran Church in 1961. [10] Includes membership of the Unitarian Churches and the Universalist Church of America, which merged in 1961. [11] Includes church bodies with less than 50,000 members not listed above.

Total church membership set a new record in 1961, and represented 63.4% of the population. Roman Catholic membership showed a gain of 1.9% in 1961; Protestants (reporting) gained 1.2%.

CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS

Convert baptisms numbering 88,807, together with children blessed and children baptized in stakes and missions, brought church membership to 1,823,661 as of Jan. 1, 1962, organized into 3,143 wards and independent branches in 345 stakes, and 1,820 branches in 64 full-time missions.

In 1962 more than 11,000 full-time and 6,500 local missionaries were serving throughout the world. New missions were created in Great Britain, Germany, South America, and Korea. New stake organizations were effected in various parts of the United States, Canada, Mexico, Samoa, Germany, Switzerland, England, and Scotland.

George Q. Morris, a member of the Quorum of the Twelve Apostles, passed away on April 23, 1962. Theodore M. Burton, assistant to the Twelve, was appointed president of the European Mission, with headquarters in Frankfurt, Germany, succeeding Alvin R. Dyer. At the October General Conference, Nathan Eldon Tanner was sustained as a member of the Council of the Twelve Apostles, filling the vacancy caused by Morris' death. Bernard P. Brockbank was sustained as an assistant to the Council of the Twelve.

On May 26, 1962, a site was dedicated and ground-breaking services were held for the erection of the Oakland, Calif., Temple, the 15th such edifice to be erected in this dispensation.

An All-Church Coordinating or Correlation Council, with three coordinating committees (one for children, one for youths, and one for adults) was established. The Council and these committees will correlate and coordinate the instructional and activity programs of all priesthood quorums and auxiliaries, including missionary instruction and activities for the entire church.

Brigham Young University enlarged its facilities by the completion and dedication of the new library and administration building.

The Salt Lake Tabernacle Choir won a special citation for the movie presentation *With Music Ring* at the Edinburgh Film Festival in Scotland, and the Peabody Award for public service in television for a coast-to-coast broadcast on New Year's Eve, 1961, of *Let Freedom Ring;* and participated in the initial intercontinental Telstar satellite broadcast from Mt. Rushmore, S.Dak.

To increase its facilities for helping the needy, the Welfare Program doubled the capacity of its Central Bishop's storehouse and expanded the Deseret Industries program.

JOSEPH ANDERSON,
Secretary to the First Presidency.

CHURCHES OF CHRIST

Using the New Testament as their only guide in religious faith and practice, the Churches of Christ numbered 2 million members and 22,000 congregations in 1962. Once largely confined to the southern United States, the churches have spread to large urban centers in the North. In 1962, 12 congregations were started in the Chicago area and six in Detroit. In New England, 10 were started in 1961–62; and on Long Island, three were started in 1960–62. In New York City, the first church erected by the Manhattan Church of Christ was planned to be built on Madison Avenue.

Enrollments in the church's schools increased to 17,239 in 1962, and three Bible chairs were established, in Kansas, New Mexico, and California. The church's growth is reflected in the rebuilding of the Children's Home, near Pomona, Calif., at a cost of $200,000, and the expansion of the Shults Lewis Children's Home at Valparaiso, Ind. *Action,* a new publication, appeared in Los Angeles, and others are planned.

In 1962 the full-time ranks of foreign missionaries were increased by 25 to a total of 211. Greece, Yugoslavia, Ecuador, the Dominican Republic, Vietnam, and Peru were entered. In Nigeria, where the Churches of Christ have 5,000 congregations, 40,000 members, and 15 schools, preparations were made to offer secondary education. Three radio programs were being broadcast to West Africa. Plans were made to start Hong Kong College in 1963.

ELZA HUFFARD,
President, Northeastern Institute for Christian Education.

CITY PLANNING

As the problems associated with the vast urban expansion of the 1960's became both more complex and more difficult to cope with, interest in urban affairs continued to mount in the United States. President Kennedy cited urban development as among the nation's most severe and unattended areas of domestic concern, and recommended that a new cabinet-level Department of Urban Affairs be created to deal with the related issues. Although Congress did not approve the legislation in 1962, the president's proposal symbolized official America's sharpened attention to what has been called the "metropolitanization of the nation."

Recent Growth in City Planning.—In local, state, and federal governments, in civic groups of diverse sorts, and in the universities and colleges, a vast array of specialized talents was being mobilized in 1962 in the growing effort to supply demanded social services, to replace obsolete structures, and to guide the location and the character of new buildings and new public facilities. The array of problems resulting from rising suburban populations—water and air pollution, traffic delays, needed new schools, and the rising costs of the goods and services purchased by municipalities and by private families—continued to swell the wave of citizen participation in suburban community affairs. At the same time, continuing poverty of central city families, the accelerating physical obsolescence at the metropolitan centers, and the accelerated aging of buildings in the large, middle-territory, "gray areas," were calling forth improved programs for dealing with them.

This recent growth in city planning activity was reflected in the size of the professional society's membership rolls. The American Institute of Planners was founded in 1917, but by 1942 its total membership stood at only 197. In 1952, it had risen to 1,033; and by mid-1962, membership in the institute was nearly 3,100. Accounting for nearly three fourths of those eligible for election to membership, these city planners were paralleled by much larger cadres of specialists in engineering, architecture, finance, and a growing array of social sciences, all of whom were joining in a collaborative enterprise. By the end of 1962, over 20 universities had established research centers devoted to studies of cities and regions. (See also HOUSING.)

The Advent of Simulation Models.—City planning has traditionally been an activity seeking to "design the city" by deciding in advance of acting. In many professional fields in which workers seek

to design a product or a future condition, empirical experiments can be conducted to test the consequences of a given act. Thus, in designing an auto or a radio, alternative designs can be built, tested, and, if necessary, modified. Or, if the costs of building full-scale models of the final product are too high, as with a flood-control works, a miniature three-dimensional physical model can be built simulating the full-scale version.

It is not possible to test out alternative designs for a city in either of these ways, however. The costs of experimentation would be prohibitive, and the results of the actions would not become apparent for many years. It would then be too late to undo undesired consequences. Instead, a more abstract mode of simulation is necessary for city analysis. Urban simulation models, as they were emerging in 1962, are merely statements that describe or, at best, explain, relations among components of the city. Typically expressed in the language of mathematics, such a statement, if valid, permits one to vary one component and to deduce the consequent effect on another. Of course, many factors influence each component of a city's plan, and a comprehensive simulation model of a metropolitan area would be very complex. But recent improvements in the theory of urban growth are permitting just this kind of simulation model to be developed and applied in city planning practice.

The Penn-Jersey Transportation Study, devoted to preparing a plan for the area extending from Trenton to Camden-Philadelphia, had by the end of 1962 made the major advances in developing and using such a model. Other simulation models were emerging for different purposes, the first for community renewal programs.

Community Renewal Programs.—Initially authorized in the Housing Act of 1959, the Community Renewal Program (CRP) first became a major force in 1962. By the end of the year, about 100 municipalities had received federal grants covering two thirds of renewal costs.

Conceived as a means for dealing comprehensively with city building activities, the CRP was at once an attack on the project-by-project approach to urban renewal and an effort to coordinate and to integrate all activities of all city agencies concerned with physical development.

A variety of approaches emerged across the nation in this novel federal-local planning enterprise; the efforts of Pittsburgh, Pa., San Francisco, Calif., and Detroit, Mich., were notable, however. Each was independently seeking to draw upon recent theoretical and methodological developments and to build a model that would simulate the city's growth processes. By introducing alternative hypothetical governmental actions at simulated points in future time, the influences on market processes were to be predicted, thus making possible more sensitive public programs directed toward specific goals. (See also HOUSING.)

Other Events.—The Chicago Area Transportation Study (CATS) submitted its final report, in which a highly innovative method was employed to identify the least-cost highway plan. In Washington, D.C., the National Capital Transportation Agency reported to Congress, proposing an 80-mile rail-rapid-transit system, including an extensive subway under central Washington. In the San Francisco Bay area, after 13 years of study and planning, a proposal to build an all-new, extensive, $1 billion rail-rapid-transit system was accepted by the voters. Construction is to start in 1964, and service is to begin in 1968 on this, one of the largest public works projects in the nation's history. (See also URBAN TRANSIT.)

ELLINWOOD IN TUCSON (ARIZ.) STAR

"SHOT FROM UNDER HIM?"

Urban renewal projects around the country were moving toward completion. Downtown Baltimore's Charles Center, among the largest in the nation and a pace-setter in large-scale urban design, was in full construction on a site in the heart of the central district. The Boston CRP studies independently incorporated a major effort to improve the visual qualities of Boston. Throughout the United States, a new emphasis on the visual design of cities was emerging.

CIVIL DEFENSE

Responsibility for national civil defense in the United States was transferred from the Office of Civil and Defense Mobilization, a small independent agency, to the Department of Defense on Aug. 1, 1961, by a presidential executive order. The program is supervised within the department by the Office of Civil Defense (OCD) and is directed by Assistant Secretary of Defense for Civil Defense Steuart Pittman, who was appointed on Sept. 19, 1961.

In December 1961, the Defense Department announced a program to establish 235 million shelter spaces—70 million to be identified in existing buildings, 100 million to be built through a shelter-incentive program, 5 million to be incorporated in federal buildings, and 60 million to be provided entirely by private means.

Defense Secretary Robert McNamara on Feb. 9, 1962, sent the proposed shelter-incentive legislation to Congress. The OCD was to be given $460 million for payments to schools, hospitals, and other nonprofit welfare institutions building public fallout shelters with a capacity of 50 or more persons. Up to $25 per shelter space was to be authorized (the average cost per shelter space is about $40). On February 16, President Kennedy delegated specific responsibilities to federal agencies for rehabilitation after nuclear attack.

On August 1 the House of Representatives approved a bill that trimmed the OCD's budget from

the proposed $695 million to $75 million and eliminated the shelter-incentive plan altogether. Two days later, President Kennedy made a personal appeal to congressional leaders to restore $235 million for the program of marking shelters in existing buildings. In the bill that was finally passed and signed by the president on October 4, $113 million was appropriated for all federal civil defense programs—$75 million for the operation and maintenance of existing programs and $38 million for the shelter-marking program.

Shelter analysis procedures had been taught to about 2,700 architects and engineers in the winter of 1961–62. By late October 1962, the survey conducted by them had identified shelter space for 100 million persons in existing structures throughout the United States. The radiation hazard would be 100 times less inside these structures than outside them.

Public apathy was blamed for Congress' failure to implement the civil defense program further. Public interest in home shelters, which had begun with the Berlin crisis in 1961, had decreased considerably by the spring of 1962. Moreover, the value of shelters was still doubted by many, despite assurances by the president and the secretary of defense that they could save millions of lives in the event of a nuclear attack.

Plans for the first shelters to be incorporated in federal buildings were announced on June 1. The Defense and Agriculture departments jointly planned 12 shelters, to protect 1,750 persons, in Forest Service buildings to be built in eight states.

The Cuban crisis in October gave a strong impetus to civil defense. Fear of nuclear attack prompted an examination of available shelter space which determined that relatively few shelters were stocked with food and water. On October 27, a three-month accelerated program to expedite all civil defense efforts was announced by Assistant Secretary Pittman at a conference with members of the Civil Defense Committee of the Governors' Conference. At the same time, President Kennedy called for the support of all governors in carrying out the program.

CIVIL LIBERTIES

An almost revolutionary increase in emphasis on civil rights has taken place in the United States during the past fifteen years. To some degree this is the result of a natural maturation process in which the nation became aware of the many inequalities and discriminations within its society. But the emphasis was also produced by the world situation in which the United States found itself the leader and the most powerful force in the cold war. As a way of life, democracy has been on trial and, in the process, new blood has been transfused into civil liberties.

Dominating this postwar period is the rightful claim of the Negro citizen to equal opportunity without discrimination. Although much remains to be done, progress has been made in integrated education, the right to vote, and equality in housing and transportation. Before World War II, little was heard of various procedural rights based on due process. Since then the courts have increasingly guaranteed the right against self-incrimination and have protected an accused against illegally obtained evidence. The right of free speech has also become more absolute in recent years, in spite of certain contractions during the so-called "McCarthy period." Released-time for religious instruction and aid to parochial schools have been challenged in the name of separation of church and state.

The guarantee of no one civil liberty dominated the year 1962. Rather, the focus was on three: the separation of church and state, equal representation for all voters in a state legislature, and the right of a qualified Negro to attend an all-white university.

Of these three issues, the most contention resulted from a U.S. Supreme Court decision, *Engel v. Vitale,* invalidating an officially prescribed prayer in the schools of New York. On the recommendation of the New York Board of Regents, the Board of Education of New Hyde Park had directed that the recommended "nondenominational" prayer be repeated aloud by each class at the beginning of the school day. Objection was raised by the parents of ten pupils on the ground that the prayer was contrary to their beliefs and a violation of the "establishment clause" of the 1st Amendment to the Constitution, which provides that Congress and the states shall "make no law respecting an establishment of religion." Much of the public debate that followed this decision evidenced a lack of understanding of the facts involved and, therefore, of the court's holding. Only an official prayer was banned—at least for the time being. How far the court would go at the request of minority groups to interfere with other traditional practices in public schools was not indicated. May an Old Testament verse be recited each morning? May a moment for meditation be set aside? Is the meaning of the clause clear and absolute, or does it leave room for a balance between a majority tradition and a minority right? (See also EDUCATION.)

A question allied to the prayer decision but with more political ramifications is whether the federal government, in the light of the establishment clause, may include church-related schools in a general aid-to-education bill. As in 1961, Congress failed to provide the billions of dollars advocated by the Kennedy administration. Many forces contributed, but among them was the division of opinion on the constitutionality of direct or indirect aid to parochial schools.

The second important issue of 1962—equality of voting rights and of representation—was also the result of a Supreme Court decision, *Baker v. Carr.* In spite of state constitutional requirements that representatives in the state legislatures be apportioned according to the population, as determined at each census, it has long been true that such reapportionment often has not taken place. So-called "rotten boroughs" have existed in many sections of the country. With the urbanization of society, the city dweller has often been underrepresented, as compared with his country cousin. Until 1962, the Supreme Court had avoided the problem on the ground that it was primarily political.

In the *Baker* case, certain qualified voters in Tennessee claimed that the 1901 apportionment law, still in force, deprived them of equal protection of the laws. Although the Supreme Court decided only that the issue was justiciable and referred the case back to the lower court which had held to the contrary, the political consequences have already been felt. In the November 1962 elections, legislatures were chosen by five states which had been redistricted since the Supreme Court decision. In eight states, reapportionment

propositions were on the ballot; and in other states the lower courts marked time until legislatures could act. Tennessee's first attempt at redistricting was held inadequate. Alabama accepted a proposal of the federal court. Georgia was forced to abandon its county court system. (See also Reapportionment and Redistricting.)

Compared with the prayer decision and that on reapportionment, the right of a qualified Negro to be admitted to a state university presented nothing novel. Since the Supreme Court's segregation decisions of 1954 and 1955, it has been clear that the right existed, and the years since then have witnessed a very gradual integration of races in the public schools except in parts of the deep South. What differentiated 1962 from other years since 1955, however, was the forced admission of a Negro, James Meredith, to the University of Mississippi with the aid of federal troops. (See also Education; Mississippi.)

As in earlier years of the decade, other civil liberties were protected in a variety of ways. The courts have been most punctilious in guaranteeing the right against self-incrimination, in condemning loyalty oaths which are vague, and in upsetting criminal convictions based on illegally obtained confessions or trials without benefit of counsel. Legislatures in many states have also contributed where the federal or state constitutions are not applicable. This was particularly true in 1962 in the sphere of private employment, where discriminatory practices came under legislative or administrative prohibition.

Associate Dean,
New York University School of Law.

CLEVELAND

A major industrial center and a Lake Erie port, Cleveland, Ohio, is the largest city in the state and the eighth most populous in the nation (1960 census, 876,050; 1961 est., 869,715). It is the seat of Cuyahoga County, eighth among United States counties in 1960, with 1,647,895 residents (1961 est., 1,679,879). Cleveland covers 75.66 square miles; the county, 460 square miles.

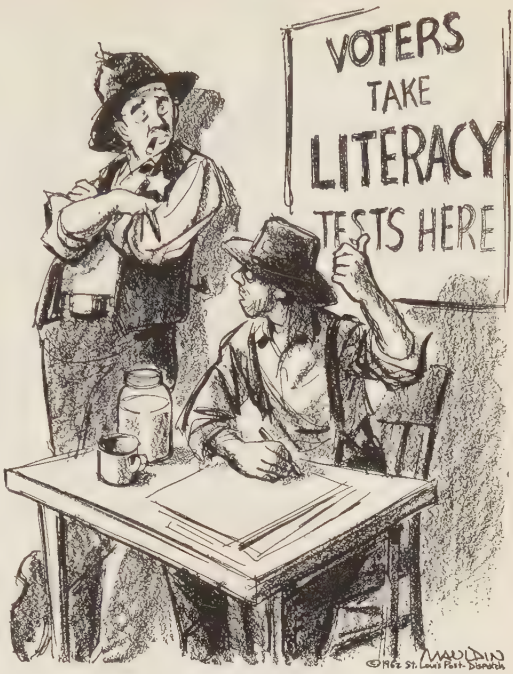
The Cleveland City Council appropriated $56,233,222 on March 26 for 1962 operations. Net tax-supported debt, Jan. 1, 1962: $129,270,771. The 1961 city real estate tax for all purposes (yielding 1962 revenue): $40.

Public school enrollment in the city was 145,000 in 1962; in the entire county, 300,000. Roman Catholic parochial schools in the county enrolled 103,000 pupils, and other parochial and private school, about 5,000.

In 1962, considerable interest was centered on politics, which locally was enlivened unexpectedly on July 14 when Mayor Anthony J. Celebrezze (first elected in 1953) was appointed secretary of health, education, and welfare by President Kennedy. Celebrezze's departure for Washington necessitated a primary election on October 2 and a run-off on November 6 to determine his successor through 1963.

When Celebrezze resigned on July 27, the city law director, Ralph S. Locher, automatically became mayor pro tem. An independent Democrat, Locher defeated two other candidates in the primary, and on November 6 won easily over the Republican candidate, Willard W. Brown (a businessman not previously in politics), with 74% of the 241,000 votes cast.

Cleveland voters also approved these proposals: renewal of the city's 12.55-mill operating levy; renewal of the schools' 11.1-mill operating levy with increases of 1.5 mills in 1963 and 2.5 mills in 1964; $55 million for school construction; and $4 million for sewers. Half fares on buses for elderly persons were authorized.



MAULDIN IN THE ST. LOUIS POST DISPATCH

"By th' Way, What's That Big Word?"

Cuyahoga County approved these bond issues: $10 million for roads, $1 million for a juvenile detention home, and $1.3 million for a child-receiving home.

Numerous old downtown buildings were razed in 1962 in the first phase of the Erieview urban renewal project. The start of new office construction, however, was delayed by a property owner's lawsuit.

More links in the Inner Belt Freeway connections were completed, and construction was under way on parts of the Outer Belt. The latter ultimately will connect with the Inner Belt and with federal interstate Routes 90 and 71.

The University-Euclid renewal project near University Circle received a $16 million federal aid authorization. At the Circle, three science buildings were completed and dedicated in October: Olin materials-testing laboratory at Case Institute of Technology; Millis science center on the

James Meredith, a Negro seeking admission to previously all-white University of Mississippi, is turned away by Lt. Gov. Paul B. Johnson, Jr. (wearing hat) on September 26.

WIDE WORLD

Adelbert College campus, Western Reserve University; and Wearn medical laboratory of University Hospitals. Their total cost exceeded $13 million.

Economic improvement continued strong in 1962. The Chamber of Commerce's industrial employment index stood at 90.8 in August (1947–49 = 100), compared with 86.2 through the first eight months of 1961. Estimated steel tonnage for Cleveland-Lorain mills was 3,712,164 for January–August, up 602,753 from the corresponding 1961 period. Total nonagricultural employment in the Cleveland metropolitan statistical area (Cuyahoga and Lake counties) was 692,700 in September 1962, compared with 682,100 a year earlier.

Residents of suburban Shaker Heights had a median family income of $13,933—highest in the nation among cities of 25,000 or more, according to the Census Bureau's *County and City Data Book.*

Editorial Writer, "The Plain Dealer."

CLIMATE. See METEOROLOGY AND CLIMATOLOGY.

CLOTHING INDUSTRY

Women's clothing in 1962 continued to favor the shaped look. Among bright spots of the year's selling picture were fur-trimmed garments, simulated fur coats, wool dresses, and mohair or shetland sweaters. (See also FASHIONS.)

Coats, suits and blouses were the only major apparel items to increase in volume of shipments in 1961. Unit-price dresses, dozen-price dresses, and skirts declined. In the first half of 1962, however, only skirt shipments declined.

Preliminary net value of shipments in the women's, misses', and juniors' outerwear fields, exclusive of knit outerwear, amounted to $3,080 million in 1961, compared with $3,092 million in 1960, a minute loss. The net value for the first six months of 1962 was $1,524 million, compared with $1,463 million in 1961, an increase of 4%.

Net value of shipments in 1961, in millions of dollars, was as follows (1960 figures in parentheses): unit-price dresses, $1,310 ($1,333); dozen-price dresses, $351 ($353); coats and suits, $711 ($705); blouses, $379 ($366); skirts, $329 ($335); men's suits, tailored coats, and tailored jackets, $1,084 ($1,129); and men's separate dress and sport trousers, $527 ($522).

The output in millions of units in 1961 (1960 figures in parentheses) was: unit-price dresses, 158.7 (153.2); dozen-price dresses, 95.6 (97.5); coats and suits, 34.2 (33.1); blouses, 192.9 (185.5); skirts, 101.2 (102.6); men's suits, 19.1 (21.4); men's overcoats, topcoats, suburban coats, and carcoats, 4.5 (5.3); and men's dress and sport trousers, 89.6 (99.1).

Net value of shipments in the first half of 1962, in millions of dollars, was as follows (figures for January–June 1961 in parentheses): unit-price dresses, $697 ($682); dozen-price dresses, $194 ($188); coats and suits, $299 ($262); blouses, $203 ($186); and skirts, $131 ($145).

Production in the first half of 1962, in millions of units, was as follows (figures for January–June 1961 in parentheses): unit-price dresses, 88.9 (87.8); dozen-price dresses, 51.1 (51.1); coats and suits, 16.5 (15.2); blouses, 112.0 (103.6); skirts, 50.4 (53.4); men's suits, 10.8 (9.5); men's separate dress and sport trousers, 53.7 (44.2); and men's overcoats and topcoats, 2.0 (1.9).

New York City ranks first among the principal United States markets in manufacturers' sales of women's and misses' unit-price dresses and coats and suits, girls' and children's wear (about 70% of the total in each of these categories) and men's tailored suits and coats (34%).

Los Angeles, Boston, Philadelphia, Chicago, and St. Louis, in that order, account for slightly over 18% of the unit-dress output. Los Angeles, Chicago, Kansas City, Baltimore, and Philadelphia, in that order, account for somewhat over 20% of women's and misses' coat and suit sales by manufacturers. Philadelphia, Los Angeles, Boston, and Chicago, in that order, account for slightly over 14% of girls' and children's wear. Philadelphia, Chicago, Baltimore, Cleveland, and Rochester account for a little more than 40% of men's suit and coat production.

Total value of shipments of girls' and children's outerwear decreased to $822.8 million in 1961 from $831.5 million in 1960.

Canada.—The value of products shipped from factories of men's, women's and children's clothing, exclusive of knitting mills, was $603.6 million in 1960, compared with $594.8 million in 1959. The breakdown of these figures (1959 data in parentheses) was as follows: women's clothing, $268.5 ($261.6); men's clothing, $261.3 ($262.2); and children's clothing, $73.8 ($71.0).

SAMUEL FEINBERG,
Columnist, "Women's Wear Daily."

COAL

In 1961, world output of coal (including bituminous, lignite, and anthracite) declined to 2,880,338,000 short tons, from 2,906,471,000 tons in 1960, according to the U.S. Bureau of Mines. This was due chiefly to decreases in the United States and Asia. The United States, however, contributed 15% of world coal output. (See MINERAL PRODUCTION for output of major producing countries.)

United States.—Domestic production of anthracite, bituminous, and lignite coal in 1961, in thousands of short tons, is shown in Table 1.

Table 1—U.S. PRODUCTION OF COAL
(In thousands of short tons)

Year	Anthracite	Bituminous and lignite	Total	Change (per cent)
1955	26,205	464,634	490,839	+16.6
1956	28,900	500,875	529,775	+10.8
1957	25,338	492,704	518,042	−2.2
1958	21,171	410,446	431,617	−16.7
1959	20,649	412,028	432,677	+0.2
1960	18,817	415,512	434,329	+0.3
1961	17,446	402,977	420,423	−3.2

(Source: U.S. Bureau of Mines.)

Of the total world coal output, the United States produced 20% of the bituminous, less than 1% of the lignite, and 9% of the anthracite. United States bituminous output dropped 3%,

Table 2—U.S. PRODUCTION OF COAL, BY STATES
(In millions of short tons)

State	1958	1959	1960	1961
Alabama	11.2	11.9	13.0	12.9
Colorado	3.0	3.3	3.6	3.7
Illinois	43.9	45.5	46.0	45.2
Indiana	15.0	14.8	15.5	15.1
Kentucky	66.3	62.8	66.8	63.0
Ohio	32.0	35.1	34.0	32.2
Pennsylvania:				
Anthracite	21.2	20.6	18.8	17.4
Bituminous	67.8	65.3	65.4	62.7
Tennessee	6.8	5.9	5.9	5.9
Utah	5.3	4.5	5.0	5.2
Virginia	26.8	29.8	27.8	30.3
West Virginia	119.5	119.7	118.9	113.1
Wyoming	1.6	2.0	2.0	2.5
Other	11.2	11.5	11.6	11.2
Total	431.6	432.7	434.3	420.4

(Source: U.S. Bureau of Mines.)

and anthracite 7%, from that of 1960. Consumption of bituminous coal and lignite declined nearly 2%, chiefly in bunkers, coke ovens, cement mills, and retail deliveries. Consumption of anthracite declined 10%, due to continuing losses to competitive fuels for use in space heating. Exports of bituminous coal decreased 4%, and exports of anthracite coal increased 7%, according to the Bureau of the Census. Employment in bituminous mining declined 11%, and in anthracite mining, 17%.

Bituminous coal and lignite were mined in 26 states, and anthracite in one state, Pennsylvania. Table 2 shows that 13 states supplied all but 11.2 million tons of the total 420.4 million tons in 1961.

Canada.—Bituminous coal production declined from 8,840,000 short tons in 1960 to 8,189,000 tons in 1961, and lignite increased from 2,170,000 tons in 1960 to 2,209,000 tons in 1961.

Germany.—West Germany's production of bituminous and anthracite increased from 157,911,00 short tons in 1960 to 158,309,000 tons in 1961. East Germany's output declined from 2,999,000 short tons in 1960 to 2,950,000 tons in 1961. Lignite production in West Germany rose from 105,974,000 tons in 1960 to 107,140,000 tons in 1961, and that of East Germany rose from 248,461,000 tons in 1960 to 260,586,000 tons in 1961.

United Kingdom.—Production of bituminous and anthracite coal declined from 216,838,000 short tons in 1960 to 213,321,000 tons in 1961.

USSR.—Output of bituminous and anthracite coal increased from 413,292,000 short tons in 1960 to 415,483,000 tons in 1961. Lignite declined from 152,406,000 short tons in 1960 to 142,727,000 tons in 1961.

F. E. HARRIS, *Former Publications Editor, "Mineral Trade Notes"; and* BERENICE B. MITCHELL, *Commodity Industrial Analyst, Division of Foreign Activities, U.S. Bureau of Mines.*

COAST AND GEODETIC SURVEY, U.S.

Oceanographic, cartographic, physical sciences, and research activities of this bureau of the U.S. Department of Commerce were enlarged in 1962.

Oceanography.—The ships *Pioneer, Surveyor,* and *Pathfinder* made progress in oceanographic work in the Pacific area. Oceanographic stations were observed in the Gulf of Mexico by the *Hydrographer,* and oceanographic and marine magnetic observations were conducted by the *Explorer* on track lines between the Virginia capes and Puerto Rico; geological-echo-profiling instrumentation was tested successfully aboard these ships. Two new survey ships, the *Peirce* and the *Whiting,* were launched by the end of 1962. Construction was started on a 303-foot oceanographic ship, which will be the largest in the United States designed specifically for oceanographic surveys, and on a 220-foot survey ship.

Hydrographic Surveys.—Five ships conducted surveys along the Atlantic coast, to revise nautical charts affected by the severe storm of March 1962, and over extensive areas along the Pacific and Gulf coasts and in Alaska. A circulatory survey of Charleston Harbor was conducted by the ship *Marmer* to obtain data for a tidal current chart of the area.

Geodetic Surveys.—Aided by new precision distance-measuring techniques, space satellites, and ballistic cameras, the bureau established about 2,500 new geographic positions in 1962, and determined elevations for about 8,000 new bench marks in the United States. Instrumentation for diverse measurements of the solid earth and its waters was being improved.

Photogrammetric Surveys.—Notable advancements were made in 1962 in photogrammetric techniques, including a new method of compiling coastal topographic and alongshore information directly onto nautical chart drawings from tide-controlled infrared and color photography. The first known topographic mapping of the deep-sea bottom was accomplished by a specially arranged stereoscopic camera using 35-mm. color film.

Cartographic Activities.—Three new series of small-craft charts were published, and Intracoastal Waterway Chart No. 857 of the Tampa, Fla., area was issued in a new format to facilitate use in small-craft navigation. En route high-altitude aeronautical charts were reconstructed to harmonize with low- and intermediate-altitude charts. Nautical and aeronautical chart distribution in 1962 totaled about 54 million copies.

Geomagnetism and Seismology.—Magnetic data were gathered at observatories and repeat stations throughout the United States, and work continued in support of the Antarctic research program. Facilities and assistance were provided for testing and calibrating magnetic instrumentation for rocket and satellite vehicles. Data are being accumulated at the World Data Center in Washington from stations in more than 30 countries in the worldwide network of standard seismograph stations.

H. ARNOLD KARO,
Rear Admiral, USC&GS;
Director, U.S. Coast and Geodetic Survey.

COAST GUARD, U.S.

Maritime safety and law enforcement, the traditional peacetime duties of the Coast Guard, continued in 1962 to be the focus of operations. A start was made toward replacing 165-foot cutters with 210-foot vessels. Funds available to the service rose from $349,749,356 in 1961 to $365,739,512 in 1962. Military personnel totaled 31,511 in 1962, compared with 31,520 in 1961, while authorized civilian employees in 1962 numbered 4,894.

Law-enforcement activities in 1962 included: vessels boarded and papers examined, 171,150; reports of violations of the Motorboat Act, 53,706; reports of violations of port security, 1,244; permits to load or discharge explosives, 756; waterfront workers screened for security, 25,776.

Assistance rendered during 1962 was as follows: assistance calls answered, 35,848; value of property involved (including cargo), $1,553,333,800; mileage disabled vessels towed, 13,593; lives saved or persons rescued from peril, 2,597.

Marine casualties reported and investigated during the year totaled 4,200, in which 166 persons lost their lives. The Coast Guard completed 4,218 inspections of merchant vessels with a gross tonnage of 8,532,734, made dry-dock examinations of 5,731 vessels with a total tonnage of 13,413,450, conducted 25,107 miscellaneous inspections, and reviewed plans for 35,915 vessels.

As of June 30, 1962, there were 40,989 aids to navigation maintained by the Coast Guard in the United States and other areas. These included 68 loran stations, 191 radiobeacons, 6,639 daybeacons, 10,659 lights (including lightships), 567 fog signals (except sound buoys), and 22,835 lighted and and unlighted buoys. Four ocean stations were maintained in the North Atlantic and two in the Pacific throughout the year. They provided search and rescue, communications, and air navigation facilities and meteorological services along heavily traveled ocean routes.

Ice conditions in 1962 were relatively light, and the Coast Guard continued its oceanographic work and aerial reconnaissance.

The Coast Guard's larger vessels included 181 cutters and buoy tenders of various types; fixed- and rotary-wing aircraft in operation totaled 134.

Coast Guard Reserve strength was 4,467 officers and 26,881 enlisted personnel. The Coast Guard Auxiliary, a nonmilitary volunteer organization was active in approximately 761 communities to promote safety and efficiency in the operation of small boats. Its 21,675 members gave instruction to 117,000 persons, examined 130,000 motorboats, patrolled 1,585 regattas, responded to 5,061 assistance calls, and saved 274 lives.

During 1962 the Atlantic Merchant Vessel Reporting System (AMVER), started in 1958, facilitated the Coast Guard's search and rescue work.

EDWIN J. ROLAND,
Admiral, USCG, Commandant.

COBALT. See MINERAL PRODUCTION.

COCOA

World production of cocoa beans for the 1962–63 season was estimated by the Foreign Agricultural Service of the U.S. Department of Agriculture in October 1962 at 2,818,020,000 pounds, the largest crop on record. The figure is 10% higher than the 1961–62 production, and 7% above the previous record crop of 1960–61. The accompanying table shows production by continents and principal producing countries.

WORLD COCOA BEAN PRODUCTION
(In thousands of pounds)

Continent or country	Average 1955–60	1960–61	1961–62	1962–63[1]
North America	172,420	182,950	182,600	197,970
Dominican Republic	73,920	77,000	77,000	88,000
South America	519,198	493,500	489,050	514,500
Brazil	375,192	330,700	330,700	350,000
Ecuador	70,740	92,000	85,000	85,000
Africa	1,228,380	1,913,630	1,839,690	2,052,950
Cameroun[2]	133,968	157,630	170,000	183,000
Ghana	569,664	968,220	918,000	1,030,000
Ivory Coast	135,248	206,740	181,920	190,000
Nigeria[3]	279,360	432,000	426,630	500,000
Asia and Oceania	33,012	44,800	48,500	52,600
World total	1,953,010	2,634,880	2,559,840	2,818,020

[1] Estimated. [2] Includes former British Southern Cameroons beginning with 1961–62. [3] Includes former British Southern Cameroons before 1961–62. (Source: U.S. Department of Agriculture, Foreign Agricultural Service.)

Production in Ghana, the world's largest producer, was estimated to be 112 million pounds higher than in 1961–62, and was expected to surpass 1 billion pounds for the first time. Brazil, the second largest producer in the world, was expected to produce slightly more than in 1961–62.

COFFEE

Total world production of green coffee for the marketing year 1962–63 was estimated (as of October 1962) by the Foreign Agricultural Service of the U.S. Department of Agriculture at 65,932,000 bags (of 132.3 pounds each). This production would be a drop of about 8% from the 1961–62 output of 71,215,000 bags, but would still exceed world requirements by about 6 million bags.

Exportable production for the 1962–63 marketing season was estimated at 52,684,000 bags, more than 5 million below 1961–62 but 20 million above the 1950–55 average of 32,588,000 bags.

The decline in production was totally due to a sharp decrease in Brazil where a crop of only 27 million bags was expected, compared with 35 million the year before. Brazil's production for export was estimated at 20 million bags, compared with 28 million a year earlier. Colombia, the world's second largest producer of coffee, anticipated production of 7,800,000 bags, the same as in the preceding year.

Africa, ranking second only to South America, expected a 1962–63 crop of 14,600,000 bags, of which 14,043,000 would be exportable. This would be a record output for Africa and about 18% above 1961–62.

PRODUCTION OF GREEN COFFEE IN PRINCIPAL COUNTRIES
(1,000 bags)

Country	Average 1950–51—1954–55	1961–62	1962–63 (October estimate)
Brazil	18,964	35,000	27,000
Colombia	6,330	7,800	7,800
Angola	1,019	2,800	3,100
Ivory Coast	1,210	1,650	2,800
Republic of the Congo	613	900	950
Mexico	1,373	2,350	2,500
El Salvador	1,216	1,800	1,600
Guatemala	1,129	1,650	1,850
Uganda	754	1,900	2,150
Indonesia	985	1,500	1,500
World	41,048	71,215	65,932

Per capita consumption of coffee by United States civilians was estimated by the Economic Research Service of the U.S. Department of Agriculture at 16.0 pounds in 1962, compared with 15.7 in 1961. The 1947–49 average consumption was 18.2 pounds, and the 1935–39 average, 14 pounds.

C. J. ENZLER,
Information Specialist, Office of Information, U.S. Department of Agriculture.

COINAGE. See TREASURY DEPARTMENT, U.S.

COKE

World output of coke in 1961 totaled an estimated 305,961,000 short tons, a slight decrease from 308,209,000 tons in 1960. (See MINERAL PRODUCTION for output of major producing countries.)

In 1961, coke output in the United States declined to 51,711,187 short tons, 10% less than in 1960. This total comprised 50,830,409 tons of oven coke and 880,778 of beehive coke. Additionally, 3,390,689 tons of coke breeze were produced in 1961, compared with 3,743,115 tons in 1960.

The decline in coke output was due to the general recession in industrial activity. Coke was produced in 20 states in 1961; 15 states east of the Mississippi produced more than 90% of the total. Consumption of coke decreased 9% from 1960. Lessened demand, especially in the residential-heating and gas-manufacturing fields, because of competition with fuel oil and natural gas, was the principal reason for the decline. In the first nine months of 1962, coke output in the United States was 40,008,912 short tons, compared with 36,699,700 tons in 1961.

COLLEGES AND UNIVERSITIES

A selected list of accredited colleges and universities in the United States, Guam, Puerto Rico, and Canada appears on the following pages. Statistics, unless otherwise indicated, are for the fall semester of the 1961–62 academic year. All information concerning these institutions has been supplied by the head or registrar of each. (See also EDUCATION; and for a more complete list of institutions of higher education in the United States, consult the *Education Directory*, Part 3, "Higher Education," published annually by the Office of Education, Department of Health, Education, and Welfare, Washington, D.C.)

MAJOR COLLEGES AND UNIVERSITIES, U.S. AND CANADA, 1961–62

Faculty and student enrollment figures are for the fall semester of the 1961–62 academic year unless otherwise specified. Faculty data show combined full-time and part-time members of the teaching faculty only. The "graduate" students column includes professional students. The "total students enrolled" column shows the combined total of full-time and part-time students in all categories. The following letter symbols are used in this listing:

AdC—Advent Christian
AG—Assemblies of God
AMA—American Missionary Association
AME—African Methodist Episcopal
AMEZ—African Methodist Episcopal Zion
Bapt—Baptist
C—Coeducational or Coordinate
CBr—Church of the Brethren
CC—Church of Christ
CG—Church of God
CMA—Christian and Missionary Alliance
Co—County
Cong—Congregational
DC—Disciples of Christ
EC—Evangelical Covenant
EUB—Evangelical United Brethren
Fed—Federal
Fr—Friends
Inter—Interdenominational
Jew—Jewish
LDS—Latter-day Saints
Luth—Lutheran
M—Men only
MCA—Missionary Church Association
ME—Methodist Episcopal
Men—Mennonite
Meth—Methodist
Mor—Moravian
Mun—Municipal
Naz—Nazarene
PE—Protestant Episcopal
Pres—Presbyterian
Pri—Private
Pri-Co—Private-County
Prov—Provincial

COLOMBIA

The Republic of Colombia, situated on the northwest corner of South America, has an area of 439,519 square miles and a population of 14,768,510 (mid-1962 est.). Principal cities and populations (1961 est.): Bogotá, the capital, 1,256,640 (including suburbs); Medellín, 651,240; Cali, 639,900; and Barranquilla, 452,140. Spanish is the official language.

Government.—Colombia's constitution provides for a Senate (98 members, elected for 4-year terms) and a House of Representatives (184 members, elected for 2-year terms). A constitutional amendment adopted in 1957 requires bipartisan government until 1974; the presidency is to alternate between a Liberal and a Conservative, and legislative and administrative posts are shared equally. The president (Guillermo León Valencia, inaugurated Aug. 7, 1962) serves a 4-year term and is ineligible for the next four years. Major legislation requires a two-thirds majority for passage. The judicial system is headed by a 16-member Supreme Court.

Education and Religion.—Roman Catholicism enjoys privileged status under Vatican concordat. Courses in Catholicism are required by law in all public schools; in large sectors of the country private schools other than Catholic are prohibited. About 62% of the population is literate, but few pupils attend school beyond the third or fourth grade. School enrollment (1959): primary and secondary, 1,655,346; technical and commercial, 71,870; teacher-training, 19,108; higher education, 21,327. There is a technical institute at Cali; an industrial institute at Popayán; industrial training schools in Bogotá, Pereira, Barranquilla, and Medellín; an agricultural normal school at Buga; and a school of business administration and finance in Medellín.

Finance.—The peso exchange rate for export of most commodities is 6.5 pesos to the U.S. dollar; the free rate of exchange in November 1962 was 9.9 pesos to the dollar. Government revenue, 1963 est.: 4,090 million pesos (3,526 million in 1962); expenditure, 3,852 million (3,526 million), including 667 million for public works, 665.6 million for financial operations, 572.7 million for education, 440.6 million for the armed forces, and 205.9 million for development. National debt (May 1962): 2,333 million pesos; external debt (June 1961): $376.1 million (with payments not due on $176 million until after 1971). World Bank loans to Colombia totaled $270 million as of mid-1962. Gold and foreign exchange reserves (September 1962): $157 million (January 1962: $128 million).

Transportation and Communications.—In 1961 the Greater Colombia Merchant Fleet (48 ships) carried 1.94 million tons of cargo (11% above 1960) and grossed $48.5 million (8% increase). Civil air traffic (1961): 821,744,000 passenger-kilometers (6% above 1960); 48,144,000 ton-kilometers of cargo (up 14%). Railroad mileage, 2,191; roads, 18,651 miles (national highways, 8,542). Other data for 1960: passenger cars, 89,600; commercial vehicles, 82,900; telephones, 294,650 (1961); radios, 1,971,000; and television sets, 150,000.

Economic Indicators.—Gross national product (1960): 26,160 million pesos (23,150 million in 1959); average annual per capita income, $246. Cost-of-living index (1958 = 100): 124 as of July 1962. Index of agricultural production (1952–7 = 100): 118 in 1959–60. Average hourly wage of industrial workers (1961): 1.59 pesos. Annual rate of manufacturing growth: 4.1% in 1961 (5.3% in 1956–60).

Manufactures and Minerals.—Industrial production, 1961: crude oil, 53.2 million barrels (down 5% from 1960); cement, 1.6 million metric tons (up 12%); iron and steel, 180,000 tons; gold, 401,064 troy ounces (down 7.6%); silver, 127,943 troy ounces (down 5%); electric power, 3.75 billion kw.-hr. (1960). Industry employed 252,000 workers in 1960. In 1961, 48% of crude oil production was refined, and 52% was exported. The public oil corporation, ECOPETROL, earned 463.4 million pesos in 1961 (229.6 million in 1960).

Agriculture.—Colombia's chief crop is coffee; output in the 1960–61 crop year totaled 7.8 million bags (of 132.3 pounds each). The world market price quoted for Colombia's premium coffees dropped from 90 to 40 cents in the period 1954–62, causing a large loss in Colombian trade receipts. Other crops and 1961 output: sugar, 328,000 metric tons (1962 est., 375,000); tobacco, 61.3 million pounds (1962 est., 68.2 million); potatoes, 400,000 tons (1962 est.). In 1958, 40,000 tons of cotton were imported to meet domestic needs; in 1962, an estimated 26,000 tons were exported.

Foreign Trade.—Total exports, 1961: $433.5 million ($464.9 million in 1960); imports, $577.1 million ($517.2 million). Chief exports, 1961: coffee, $307.9 million ($333.5 million in 1960); petroleum, $68.2 million ($80.4 million); other products, $37.2 million ($26.6 million). The United States is Colombia's chief trading partner, supplying in 1961 about 51% of Colombia's imports and taking 60% of total exports. Shipments of coffee to the United States have declined steadily, from 26% of total United States coffee imports in 1940 to 18% in 1961.

Events, 1962.—On January 1 the state of siege was lifted. On March 18 the generally peaceful

and honest congressional elections gave a clear-cut victory to the bipartisan National Front. Election results were as follows:

Party	House seats	Senate seats
National Front	109	68
Liberals	(59)	(37)
Ospinista Conservatives	(50)	(31)
Laureanista Conservatives	36	16
Liberal Revolutionary Movement	33	12
Other Conservatives	6	2

From five nominations made by the Conservative Party Convention, the Liberal Party Convention chose as the National Front candidate for the presidency the Ospinista Conservative, Dr. Guillermo León Valencia. The aristocratic Dr. Valencia was elected president on May 6, receiving 1,636,081 votes. The ultra-conservative Jorge Leyva received 309,375 votes; ex-dictator Gen. Rojas Pinilla, 54,960; and López Michelsen, the "ambivalent leftist," 624,438. Only 44% of the 5,900,000 registered voters went to the polls, or 8% less than in the March congressional elections. Disenchantment with the National Front record was a factor in the high voter absenteeism.

President-elect Valencia visited Washington in late June, and discussed inter-American problems with President Kennedy and other administration officials.

Immediately after his inauguration, President Valencia appointed Maj. Gen. Alberto Ruiz Novoa as war minister. Colombia's armed forces commander, the head of the joint chiefs of staff, and the chief of the air force all resigned to protest Novoa's lack of seniority. They were replaced by three new officers chosen by Valencia.

The new president indicated he was particularly anxious to quell the chronic violence in Colombia's hinterlands. He also wanted to boost food production by putting a million hectares of land in the Cauca and Sinú River valleys into intensive cultivation, and desired to train enough teachers and build enough schools to make primary education compulsory.

Much of the violence had political objectives, and was a continuation of the civil war begun 14 years ago; in 1962 the death toll increased to some 4,000. In August, President Valencia asked for emergency powers to deal with the problem. Military chiefs, assisted by United States military advisers and equipment, began to adopt new anti-guerrilla tactics and training.

In May and June, university student demonstrations turned into anticlerical and antimilitary riots. Many persons were wounded (including 19 policemen), and property damage was inflicted on the capitol building, the cardinal's palace, and a newspaper building. The universities involved were closed until August 20. The government's program to remove extreme leftist and Communist teachers helped to spark the student protests, which were made in the name of academic freedom.

In May the Colombian Evangelical Confederation (Protestant) petitioned the United States ambassador, Fulton Freeman, to make conditional Alliance for Progress educational assistance (some $40 million) on the elimination of notorious religious discrimination in the public schools. Generally the press viewed the request as akin to intervention and ignored the human rights issue. President Lleras declared that aid terms affecting national religious policy would "never be accepted." In September, Procurator-General Holguín issued an opinion finding unconstitutional the 1953 agreement with the Vatican, which gave the Roman Catholic Church supervision of all schooling in the huge mission territories.

In July, 80 needy rural families of Cunday in Tolima Department were awarded 25–30 acre farms in the first distribution under the land reform law of 1961. The national program calls for compensated expropriation of "improperly cultivated" estates exceeding 4,940 acres, and for training in modern farming by the Agrarian Reform Institute.

A new oilfield was discovered at Cúcuta near the Venezuela border. Production from the first well exceeded 5,000 barrels daily. A 35-mile link to the National Andean pipeline terminating at Cartagena brought the Provincia field, which was discovered in 1960 and produces 13,500 barrels daily, into commercial production in October.

As of January 1 the 9% export proceeds tax was abolished. Colombia's annual sugar quota for the United States market was fixed at 35,000 tons; total 1962 export authorization for Colombia's 19 sugar mills was 100,000 tons. In August a free zone for industrial and commercial activity was created in Barranquilla. In May the government's heavy 1962 investment schedule (totaling 2,005 million pesos) was ordered reduced by 30% because of shortage of funds.

In August the Alliance for Progress' Committee of Nine approved Colombia's ten-year economic and social development plan, which calls for foreign loans averaging $200 million annually. A number of bond issues have been floated internally in an effort to finance development and agrarian reform.

On October 28, Colombia's foreign minister, José Joaquín Caicedo Castilla, condemned the Soviet missile bases in Cuba as intervention in the Western Hemisphere. He declared his country obligated under the Rió Treaty to support the collective action authorized by the American republics in concert.

ROBERT D. HAYTON,
Chairman, Inter-American Affairs Center, Hunter College (City University of New York).

COLOMBO PLAN. See COMMONWEALTH OF NATIONS.

COLORADO

A Western state of the United States, Colorado ranks 8th among the states in area (land, 103,884 square miles; inland water, 363) and 30th in population (1,907,000 on July 1, 1962, an 8.7% increase from the 1960 census figure of 1,753,947). Urban places with populations above 12,000 in 1960:

Arvada	19,242	Greeley	26,314
Aurora	48,548	Lakewood[1]	19,338
Boulder	37,718	Littleton	13,670
Colorado Springs	70,194	Pueblo	91,181
Denver (*capital*)	493,887	Westminster	13,850
Englewood	33,398	Wheat Ridge[1]	21,619
Fort Collins	25,027		
Grand Junction	18,694		

[1] Unincorporated place.

Government.—Chief executive and judicial officers in 1962 included Stephen L. R. McNichols (Democrat), governor, serving a four-year term; Robert L. Knous, lieutenant governor; George J. Baker, secretary of state; Tim Armstrong, treasurer; Homer F. Bedford, auditor; Duke W. Dunbar, attorney general; Byron W. Hansford, commissioner of education; and Edward C. Day, chief justice of the 7-member Supreme Court.

The Colorado General Assembly, which convenes annually, comprised 19 Democrats and 16 Republicans in the Senate in 1962 and 33 Democrats and 32 Republicans in the House of Representatives.

Legislation, 1962.—The 43d General Assembly passed 94 of the 154 bills introduced during its second regular session (January 3–February 10), most of them concerning appropriations and other fiscal matters. For the fiscal year 1962–63 the lawmakers appropriated a record sum of $111,228,603 to provide funds for most state agencies and institutions. Also appropriated was $16,947,035 for capital construction projects, of which $13,557,585 is from the

general fund. A bill was approved to transfer surplus general fund revenues each year to the capital construction fund. Largest single item in the budget was nearly $47 million for support of public schools, an increase of $9.6 million. The system for apportioning state aid to schools was revised.

One of the measures approved authorized the sale of Camp George West, a National Guard base. It was suggested that funds from the sale be used to construct a new state military center at Buckley Field, near Denver, which would also serve as headquarters for a proposed state crime bureau and training center for state, county, and local police officers.

Among other measures adopted was an amendment to the criminal statute of limitation, making state officials liable to prosecution while in office for six years (instead of three) from the time the criminal act was committed, or for three years after leaving office; bills increasing expense allowances for legislators and raising the salaries of county officers, judges, several state officials, and supreme court justices; and a bill eliminating the state weather control commission and transferring its functions to the Department of Natural Resources.

Finance.—In the 1962 fiscal year, revenue of $364,821,863 included $214,508,704 from state taxes and $105,617,865 in federal funds. Chief tax yields were the 2% general sales and use tax ($55,485,353) and taxes on motor fuels ($40,367,138), individual income ($55,260,735), and corporate income ($22,243,802). Spending of $351,065,645 included $82,490,811 for education, $87,270,219 for health, welfare, and rehabilitation, and $88,860,229 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 9,835 teachers enrolled 249,799 pupils; junior high schools with 3,507 teachers enrolled 64,585; senior high schools with 4,462 teachers enrolled 100,898; and parochial schools with 1,157 teachers enrolled 34,601. College enrollment totaled 49,707 in 18 institutions, including 6 junior colleges and 12 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $215,850,000, including current expenditures of $161 million ($426 per pupil) and capital outlays of $46 million. Revenue of $235,118,000 was drawn chiefly from state funds ($43,118,000) and local districts ($155 million). Teachers' salaries averaged $5,425 (high school, $5,550; elementary, $5,300). Actual spending for higher education (fiscal year 1961) totaled $57,897,000.

Public Assistance.—In the 1961 fiscal year, public assistance payments to a monthly average of 74,072 persons totaled $83,707,820. This amount included $62,551,318 for the aged and $12,356,059 for dependent children.

Transportation and Communications.—With 462 miles of highway construction and reconstruction completed in 1961, *roads and highways* on Jan. 1, 1962, totaled 78,630 miles (14,369 hard-surfaced). These served 989,637 *motor vehicles* (as registered on June 30, 1962). Operating in the state in 1961 were 7 *railroads* (using 3,671 line miles of track), 7 regularly scheduled *airlines*, and 63 commercial and municipal *airports*.

Communications media included (1962) 62 AM and 14 FM *radio stations*; 10 VHF *television stations* (exclusive of broadcast translator stations); (1961) 24 daily *newspapers* (circulation, 640,047) and 124 other newspapers (244,572); and Jan. 1, 1962, 259,800 business and 580,800 residential *telephones*.

Labor Force.—The state's labor force in August 1962 included 98,300 agricultural workers. Nonagricultural employment totaled 549,600, compared with 547,100 a year earlier, marking an 0.5% increase in the 12 intervening months. Of nonfarm employees, 129,500 were in trade, 117,900 in government services, and 94,500 in manufacturing. Unemployment in August 1962 stood at 29,800, compared with 24,400 a year earlier.

Manufacturing.—Manufacturing engaged 90,648 workers in 1960, including 62,224 in production, and provided a payroll of $524,978,000. Adjusted value added by manufacture totaled $935,401,000.

LEADING COLORADO MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Food and kindred products	19,152	$94,959	$222,974
Stone, clay, glass products	4,229	21,812	44,513
Chemicals and allied products	1,933	10,316	36,884
Electrical machinery	2,442	11,699	23,802
Petroleum and coal products	868	5,306	14,061
Paper and allied products	902	4,644	9,738

[1] For definition, see footnote 1 in the article *Industrial Production*
(Source: *1960 Annual Survey of Manufactures.*)

Mining.—Colorado ranked 17th among the states in the value of its 1961 mineral output, with 1.89% of the national total. This value was a 1% increase over the record of 1960. The state was first in the output of beryllium, molybdenum, tin (sole producer), and vanadium; second in carbon dioxide; and third in tungsten and uranium.

COLORADO MINERAL PRODUCTION, 1961

(In short tons, except as noted)

Mineral	Quantity	Value
Clays	556,000	$ 1,241,000
Coal	3,678,000	22,787,000
Copper (recoverable)	4,141	2,485,000
Gold (fine ounces)	67,515	2,363,000
Lead (recoverable)	17,755	3,658,000
Natural gas (1,000 cu. ft.)	108,142,000	12,544,000
Natural gasoline (1,000 gal.)	76,880	3,627,000
Petroleum (1,000 bbl.)	46,746[1]	134,628,000[1]
Petroleum gases (1,000 gal.)	115,410	5,498,000
Sand and gravel	18,360,000	16,946,000
Silver (fine ounces)	1,965,000	1,817,000
Stone	2,451,000	5,301,000
Uranium ore	1,282,462	21,509,000
Vanadium	4,149	...[2]
Zinc (recoverable)	42,647	9,809,000
Other minerals	...	101,957,000
Total	...	$343,256,000[3]

[1] Preliminary. [2] Figure withheld to avoid disclosing individual company's confidential data. [3] Total adjusted to eliminate duplicating the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $417,089,000, compared with $446,002,000 for the corresponding period of 1961. For the full year 1961, income comprised $414,418,000 from livestock, $232,594,000 from crops, and $30,325,000 in government payments. Principal income sources in 1961 were cattle, $320,751,000, and wheat, $95,674,000.

COLORADO CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	1,146	1,500	1,300
Barley (1,000 bu.)	11,598	16,784	13,530
Beans, dry edible (1,000 bags)	1,774	2,247	1,718
Corn for grain (1,000 bu.)	10,346	14,562	9,922
Hay (1,000 tons)	2,486	2,934	3,030
Onions (1,000 cwt.)	1,847	2,376	2,760
Peaches (1,000 bu.)	1,599	1,900	1,800
Potatoes (1,000 cwt.)	10,834	13,097	12,708
Sorghum grain (1,000 bu.)	6,519	8,384	9,452
Sugar beets (1,000 short tons)	2,094	2,449	2,744
Wheat (1,000 bu.)	41,828	56,789	36,207

(Source: U.S. Department of Agriculture.)

The state's 33,000 farms in 1959 had an acreage of 38,787,000 (5,879,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 2,333,000 cattle, 1,932,000 sheep, and 1,696,000 chickens. An average of 49,000 family and 19,000 hired workers engaged in farming during 1961.

Events, 1962.—The Republican Party scored a near sweep in the November elections, taking the governorship and a U.S. Senate seat from the Democrats, winning four of the six state house elective offices, and regaining control of both houses of the Colorado Legislature. John A. Love, a Colorado Springs attorney making his first bid for public office, defeated incumbent Steve L. R. McNichols in the gubernatorial race, and Rep. Peter H. Dominick of Denver won election to the U.S. Senate over Sen. John A. Carroll. Both Republicans won by surprisingly high margins, Love capturing 57% of the total vote, and Dominick 54%.

The Republican tide enabled that party to gain control of all three top elective offices—governor and the two U.S. Senate seats—for the first time in 36 years. In the state House of Representatives, the Republicans captured a command-

ing 41 to 24 majority. Each party claimed two of the state's four congressional seats, with Republican Donald G. Brotzman winning the 2d District seat vacated by Dominick.

A construction boom and a general economic upsurge continued in the state in 1962. In Denver, construction permits had risen by 29% in the first seven months of the year, compared with the same period of 1961. Major projects anticipated include new post office and Federal Reserve buildings, a 30-story office building, additions to two hospitals, and an expansion program for the Colorado National Bank. The F. W. Woolworth Co. began work on what is claimed will be the world's largest variety store, due for completion in late 1963. A $2.5 million electrical transmission line to supply power to the Denver area was being erected. The Martin Marietta Corporation was awarded a $204 million contract for development of the Titan III rocket, with most of the work to be done at the Denver division.

One of the major achievements of the year was the completion of the Navajo Trail Highway. Dedicated on September 16, it is the first all-weather route to cross the northern corner of the Navajo and Mountain Ute reservation, and will increase travel through the vast San Juan Basin.

After a 30-year campaign to win congressional approval, the Frying Pan–Arkansas River Project was passed and signed in August. The $171 million reclamation scheme will bring water from the western slope of the state to the eastern slope prairies, and eliminate the seasonal droughts which affect farmers in the Arkansas River Valley. Work began in July on the first unit of the Curecanti hydroelectric installation on the Gunnison River. Two dams and power plants are included in the $70 million project.

Lt. Comdr. M. Scott Carpenter received a hero's welcome in his home town of Boulder, on May 29, following his three-orbit space flight.

COMMONWEALTH OF NATIONS

The Commonwealth of Nations is a voluntary association of 16 nations (Australia, Canada, Ceylon, Cyprus, Ghana, Great Britain, India, Jamaica, Malaya, New Zealand, Nigeria, Pakistan, Sierra Leone, Tanganyika, Trinidad and Tobago, and Uganda) and their dependencies, recognizing Queen Elizabeth II as its head and the symbol of the Commonwealth association. In 1962, Jamaica became a fully sovereign member on August 6; Trinidad and Tobago, on August 31; and Uganda, on October 9. On December 9, Tanganyika became a republic.

Colombo Plan.—Members of the Colombo Plan for Cooperative Economic Development in South and Southeast Asia are, with the dates they joined, Australia, Brunei, Canada, Ceylon, Great Britain, India, Malaya, New Zealand, North Borneo, Pakistan, Sarawak, and Singapore (all 1950); Cambodia, Laos, South Vietnam, and the United States (1951); Burma and Nepal (1952); Indonesia (1953); Japan, the Philippines, and Thailand (1954); and Bhutan and South Korea (1962). The 11th annual meeting of the Consultative

[1] Includes Northern Ireland, Channel Islands, and Isle of Man. [2] Excludes dependencies, part of which became a separate colony, called the British Antarctic Territory, on March 3, 1962. [3] Not an integral part of the Commonwealth. [4] Excludes Jammu and Kashmir; includes Sikkim. [5] 1961 census population of India-held portion only. [6] Includes insular territories.

Committee, consisting of representatives of all the member countries, met at Melbourne, Australia, on Nov. 12–17, 1962. By June 1961, about £3,570 million in external aid had been provided to the Colombo Plan area by member countries. By June 1962, £102,589,679 had been spent under the technical assistance program, 24,062 persons from the area had been trained in technical fields, and 4,163 technical experts and equipment to the value of £32.6 million had been provided.

Commonwealth Relations.—In 1962 interest in Commonwealth relations centered on Britain's application to join the European Economic Community (EEC). At a meeting of Commonwealth prime ministers in London on September 10–19, the other governments expressed anxieties about the effects of Britain's entry on the Commonwealth. Some of the African countries considered that association with the EEC would not be acceptable; other governments wished to consider their attitude further; and India, Pakistan, and Ceylon urged the conclusion of trade agreements with the EEC to protect their interests as soon as possible. Special importance was attached to the need for safeguards for Commonwealth producers of temperate foodstuffs, certain raw materials, and, for some countries, trade in a broad range of manufactured and processed goods. As a result, the British government undertook to consult closely with other Commonwealth governments during the remainder of the negotiations. (See also EUROPE.)

Commonwealth External Trade.—Sterling Commonwealth exports in 1961, totaling £8,270 million, were about 4% higher than in 1960 despite some falling off in the second half of the year. This decline continued in the first quarter of 1962, but was halted in the second quarter. Imports in 1961, which totaled £9,779 million, were about 3% lower than in 1960. A decline in the first three quarters of the year was followed by a slight rise in the fourth quarter; another decline in the first quarter of 1962 was reversed in the second. Within the 1961 total, exports from Australia were 18% higher than in 1960, while exports from the Asian countries were lower. In 1961 imports into Australia fell by 12%, and those into Ceylon by 13%. Ghana, Hong Kong, and the West Indies showed increases. Commonwealth trade figures are shown in Table 2.

Dependent Territories.—By March 31, 1962, the total amount spent under the Colonial Development and Welfare Acts (1945, 1950, 1955, 1959) since April 1, 1946, was £251,086,464, including £24,388,055 in 1961–62. The financial contribution made by Great Britain to the dependent territories, including the investment of private capital, amounted to £90 million in 1961.

At the end of 1961 the Colonial Development Corporation had 102 projects in operation, including 13 approved during the year. Total capital committed since 1948 amounted to £115,770,000, and the corporation had a surplus of £3,453,068 on the year's working, compared with £2,417,770 in 1960. It was announced on Aug. 31, 1962, that the corporation would become the Commonwealth Development Corporation, enpowered to operate in independent countries. The ninth annual report of the Commonwealth Development Finance Company showed that the total value of investments committed by the company to March 31, 1962, amounted to £22,030,000, compared with £19,870,000 a year earlier. The company had a profit of £303,330 in 1961–62, or nearly £65,000 less than in 1960–61.

In 1961 public revenue of the colonial territories totaled £322,955,000, compared with £294,613,000 in 1960; public expenditure, £332,824,000, compared with £299,712,000. Exports from the dependent territories rose by £17 million (3%) in 1961, to £1,232 million. Imports into the territories also rose by 3% (£23 million), to £1,447 million. Britain's share of the dependent territories' trade again showed a slight decline, while that of other areas remained about the same.

In 1962 there were universities in Malta, Hong Kong, Singapore, and the West Indies, and university colleges in Rhodesia and Nyasaland, Uganda, and Kenya. There were 35,700 students from the Commonwealth in Britain in 1960–61.

On Jan. 18, 1962, the British and Malayan governments appointed a commission under the chairmanship of Baron Cobbold of Knebworth to ascertain the views of the peoples of North Borneo and Sarawak on the question of the formation of a Federation of Malaysia. Talks between the two governments followed in London, ending in an agreement in principle signed on July 31 (Brunei indicated its approval in principle on July 18). Under the agreement the federation was to be brought into being by Aug. 31, 1963. Elections in Malta on Feb. 17–19, 1962, resulted in a victory for Dr. George Borg Olivier's Nationalist Party. On August 20, in response to the Maltese prime minister's request for independence within the Commonwealth, the British government agreed to arrange discussions as soon as possible.

After a conference in London on Feb. 1–9, 1962, it was agreed that Jamaica should become independent on August 6. Princess Margaret, accompanied by the earl of Snowdon, represented the queen at the independence celebrations in Jamaica on August 3–10. Largely as a result of the Jamaican withdrawal, the dissolution of the West Indies federation was announced by the secretary of state for the colonies, Reginald Maudling, in the House of Commons on February 6. A conference of the territories (apart from Jamaica and Trinidad and Tobago, which also decided to withdraw) comprising the former federation met in London on May 9–24, and decided to form a new federation in the eastern Caribbean with its capital in Barbados. Agreement on independence for Trinidad and Tobago on August

31 was reached at a conference held in London on May 28–June 8, and the queen was represented at the independence celebrations in Trinidad on August 28–September 5 by Princess Mary, the princess royal. A conference on British Guiana independence, which was postponed from May to October 23 because of disturbances that took place in the territory on February 16–19, broke up on November 6 without reaching agreement.

Revised constitutional proposals for Northern Rhodesia were put forward by the British government on February 28. General elections held on October 30 resulted in no clear majority, and a caretaker government was formed until after elections for 11 unfilled seats on December 10. A proposed new constitution for Southern Rhodesia was to come into force after elections under new franchise arrangements. Dissolution of the Southern Rhodesian Parliament, preparatory to elections on December 14, was announced on October 27. In May and June, discussions on Nyasaland between Dr. Hastings K. Banda, leader of the Malawi Congress Party, the colonial secretary, and the governor of Nyasaland, in Zomba and London, resulted in an agreement to hold a constitutional conference. Meeting in London on November 12–24 under the chairmanship of the first secretary of state, R. A. Butler, the conference drew up a constitution for internal self-government of the protectorate.

A conference on further constitutional advance in Zanzibar, held on March 19–April 6, had to be adjourned in view of the failure of Zanzibari political leaders to agree. A conference on Kenya on February 14–April 6 resulted in agreement on a constitution providing for internal self-government. Both major political parties agreed to form a coalition government, with their leaders as ministers of state, and to continue discussions in Nairobi on the future constitution of the territory. Preindependence elections in Uganda, held on April 25, resulted in the victory of the Uganda People's Congress, and its leader, A. Milton Obote, became prime minister. Independence followed on October 9, and the duke of Kent, accompanied by the duchess, represented the queen at the independence celebrations in Uganda on October 7–17. Discussions between the British government and ministers of Aden and the Federation of South Arabia on July 23–August 16 resulted in agreement on the entry of Aden into the federation and on constitutional advances for the territory.

R. A. Butler, who became first secretary of state on July 13, had previously taken over responsibility for Central African affairs on March 15. Duncan Sandys, already secretary of state for Commonwealth relations, succeeded Reginald Maudling as secretary of state for the colonies on July 13.

COMMUNISM

During 1962, Moscow-aligned Communist governments ruled 16 countries: the Soviet Union, Estonia, Latvia, Lithuania, Poland, East Germany, Czechoslovakia, Rumania, Hungary, Bulgaria, Mongolian People's Republic, Communist China, North Korea, Tibet, North Vietnam, and Cuba. In addition, Yugoslavia and Albania were governed by Communists independent of Moscow's control. Altogether, about one third of the world's population in 1962 lived under Communist rule.

UPI

Gathered in London on September 10 for Commonwealth conference are (from left) British Commonwealth Secretary Sandys, President Makarios of Cyprus, and Prime Ministers Menzies, Australia; Diefenbaker, Canada; and Nehru, India.

World Communist Strength.—In 1962, the 88 Communist and Communist-front labor and socialist parties of the world had a total membership of approximately 41.5 million, of whom about 36.4 million lived within the Soviet orbit of nations. The largest Communist parties were the Chinese, with 17 million members, and that of the Soviet Union, with 9.7 million. Outside the Soviet orbit, the biggest Communist parties were the Indonesian, with a membership of 1.75 million, and the Italian, with 1.5 million.

Communist Dissension.—The dissension evident for some years within the Soviet orbit of nations continued in 1962. The most obvious quarrel was between the Soviet Union and Albania. As before, the two countries had no diplomatic relations, and no trade or cultural exchange with each other. The Soviet Union accused Albania of leader worship, rule by terror, one-man dictatorship, disobedience to Moscow, narrow nationalism, Stalin worship, and warlike policies. The Soviet press even stated that the Albanian leaders had joined with the international enemies of the Communist movement.

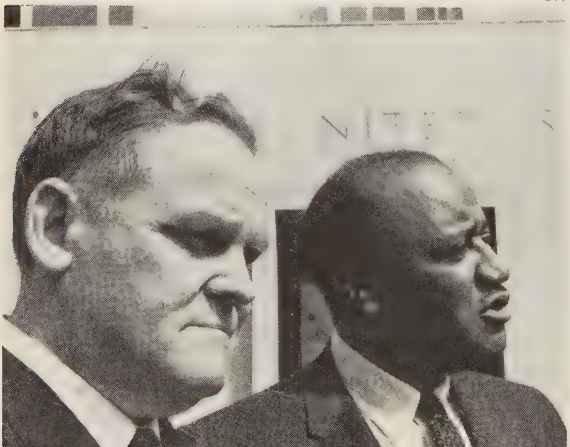
Albania retorted that it had not joined forces with Western capitalism, but that it was opposed to both capitalism and Communist revisionism. However, Albania severely criticized Soviet Premier Khrushchev as a despot who demanded slavish obedience from all Communist countries, as a vain man who encouraged hero-worship of himself while disparaging the past hero-worship of Stalin, as a revisionist subordinating Communist world revolution to disarmament, and for betraying Albania by courting archrevisionist Yugoslavia.

The Soviet-Albanian quarrel had considerable repercussion among the Communist parties of the world. Communist China openly supported Albania through credits, trade, technical aid, cultural exchanges, and pro-Albanian propaganda, but was careful to avoid any direct criticism of the Soviet Union. As a result, trade relations between the USSR and China were almost suspended early in 1962, but by spring trade was renewed at an undisclosed level apparently lower than before. A Soviet-Chinese trade agreement for 1962 was concluded in Peking on April 20, and in November a Chinese economic mission went to Moscow to conclude a trade agreement for 1963.

In this quarrel, most Communist parties in the Far East supported China and Albania. The Mongolian People's Republic and the eastern European satellites of the USSR took the side of the Soviet Union. However, both East German and Hungarian leaders publicly indicated that their countries need not fulfill all orders from Moscow. Yugoslavia and most western European Communist parties also backed the Soviet Union, but the Italian Communist Party stressed that it had some independence from Moscow. Latin American Communists generally supported the Soviet Union, as did the Communist Party of the United States, which purged a pro-Albanian group within the party. Meanwhile, Albania declared it would continue to follow Stalinist policies.

Gus Hall (l.), secretary general of the Communist Party of the United States, and Benjamin J. Davis, national secretary, meet newsmen in Washington on March 30 after pleading innocent in federal court to failure to register party.

UPI



In June the Council for Mutual Economic Assistance (an economic grouping of the USSR and its eastern European satellites) met in Moscow. Albania was not invited, but the Mongolian People's Republic was admitted to membership. Unlike previously, Communist China, North Vietnam, and North Korea sent no observers.

Eastern Europe.—The eastern European satellites of the Soviet Union contained more than 6 million Communists in 1962. During the year, alleged Stalinists were extensively purged in Hungary, and to a lesser extent in Rumania, Czechoslovakia, and Bulgaria. More than a million Communists resided in Albania and Yugoslavia. The Communist Party was illegal in Greece.

From July 29 to August 6, the 8th World Youth Festival of Peace and Friendship met in Helsinki, Finland, under the sponsorship of two Communist-front organizations: the World Federation of Democratic Youth, and the International Union of Students. The festival cost $25 million, and the attendance was 13,600—the lowest participation since these festivals began in 1947. Ghana and Nigeria refused to send official delegations, and part of the Ceylon delegation withdrew in the middle of the conference. Some delegates from Communist countries used the opportunity to defect to the West. Anti-Communist Finnish youths harassed the conference, whose pro-Soviet peace propaganda was somewhat upset by the resumption of Soviet nuclear tests before the conference ended.

Western Europe.—The largest concentration of Communists in the free world in 1962 was in western Europe, where nearly 2 million party members resided, with membership tending to decline. Communist parties were illegal in the German Federal Republic (West Germany), Portugal, and Spain. Western European Communists strongly opposed the European Economic Community (Common Market), the Franco dictatorship in Spain, the Salazar dictatorship in Portugal, the Secret Army Organization (OAS) in France and Algeria, the North Atlantic Treaty Organization (NATO), United States military and rocket bases in Europe, and West German rearmament, particularly the arming of West Germany with rockets and nuclear weapons.

Communist voting strength declined slightly in Italian local elections.

Far and Middle East.—There were nearly 1.9 million Communists in the free countries of the Far East in 1962, with party membership tending to increase. Communist parties were illegal in South Korea, Taiwan, South Vietnam, Thailand, Malaya, and the Philippines. Far Eastern Communists opposed United States military bases in Japan and American military aid to Laos, South Vietnam, Thailand, Taiwan, and Australia; the Southeast Asia Treaty Organization (SEATO); Dutch rule in West New Guinea; and the proposed Federation of Malaysia (Malaya, Singapore, and North Borneo). In July the Japanese Communist Party polled only about 3% of the total vote in elections to the upper house of the Japanese Parliament.

The Communist parties of the entire Middle East (including the Indian peninsula) in 1962 had about 200,000 members, with party membership declining. As an example of the extent of this decline, the Indian Communist Party alone had more than 200,000 members in 1960. Part of this decline is explained by the fact that Communist parties are illegal in Afghanistan, Bahrain, Iran, Iraq, Jordan, Kuwait, Lebanon, Pakistan, Saudi Arabia, Syria, Turkey, and Yemen. Another major factor was the Sino-Indian border dispute,

which split the Indian Communist Party into pro-Chinese and pro-Indian factions. Ajoy Kumar Ghosh, general secretary of the Indian Communist Party, died on Jan. 13, 1962; in April the party elected Shripad Amrit Dange as chairman and E. M. Sankaran Namboodiripad as general secretary.

Africa.—The entire African continent contained only about 12,000 Communists in 1962. Because of this numerical weakness the main Communist effort was to infiltrate non-Communist labor unions, student organizations, and liberal political parties. Communist parties were illegal in Ethiopia, Libya, Morocco, the Portuguese colonies, South Africa, the Spanish colonies, Sudan, and the United Arab Republic. African Communists opposed Western economic holdings in Africa, Portuguese and Spanish colonies there, United States technical aid to African countries, French rule in Algeria, and (after Algerian independence) the threatened civil war in Algeria.

Latin America.—There were more than 200,000 Communists in Latin America in 1962, with membership tending to increase, particularly in Cuba. The communization of Cuba continued in 1962, with the trade unions, armed forces, and governmental bureaucracy all directed by fanatic Communists, and with the entire Cuban population instructed in the concepts of Marxism-Leninism. Communist parties were illegal in Argentina, Brazil, Costa Rica, the Dominican Republic, El Salvador, Guatemala, Haiti, Honduras, Nicaragua, Panama, and Paraguay. On January 4, Peru legalized its Communist Party. On May 10, Venezuela outlawed its Communist Party, after suppressing a Communist-led rebellion. Another Communist revolt in Venezuela occurred in October but failed. Latin American Communists in 1962 generally concentrated their propaganda against the United States, particularly opposing the Alliance for Progress, United States economic holdings and political influence in Latin America, and United States actions against Cuba.

Canada.—The small Canadian Communist Party in 1962 was mostly urban, and consisted mainly of industrial workers, office employees, and students in Ontario. The party was active chiefly in mining, fishing, and electrical trade unions. Canadian Communists mainly opposed United States political, military, and economic influence in Canada.

United States.—The small Communist Party of the United States in 1962 claimed a membership of 10,000, and concentrated much of its propaganda against the John Birch Society, defensive military preparations, and the Central Intelligence Agency. The State Department on January 12 issued new regulations forbidding members of the Communist Party to receive United States passports. Almost simultaneously, the State Department revoked the passports of several Communist leaders.

On March 6, Philip B. Bart, the national organizational secretary of the Communist Party, was sentenced to six months' imprisonment by the U.S. District Court in Washington, D.C., for refusing to answer questions from a federal grand jury as to why the Communist Party did not register with the Justice Department under the Internal Security Act of 1950, in accord with a decision of the Supreme Court on June 5, 1961. On March 9, 1962, James E. Jackson, editor of the semiweekly newspaper *The Worker*, received the same sentence from the same court for refusing to give data to a federal grand jury concerning his newspaper's connections with the Communist Party. However, the decisions of the district court were reversed by the U.S. Court of Appeals in Washington, D.C., which freed Bart on June 7, and Jackson on June 28.

On March 15, Gus Hall, general secretary of the party, and Benjamin J. Davis, the party's national secretary, were arrested in New York by the Justice Department for refusing to register the party with the department in accord with the Internal Security Act of 1950. Such registration would require the party to reveal its membership and sources of financial support. The party was convicted of the charges and fined $120,000 by a federal court in Washington on December 11. On May 31, the Justice Department requested the U.S. Subversive Activities Control Board to order ten other members of the National Committee of the Communist Party to register with the department. On March 19 the government sued the Communist Party for $500,000 in delinquent income taxes (including interest) for the year 1951, claiming that the party had legally lost its status as a normal political party entitled to tax exemptions.

In a precedent-making decision the U.S. District Court in San Francisco on May 4 sentenced Archie Brown, an officer of the International Longshoremen's and Warehousemen's Union, to six months' imprisonment for violating the Landrum-Griffin Labor Act of 1959 forbidding Communists to serve as union officials.

J. Edgar Hoover, the director of the Federal Bureau of Investigation, on October 1 published a book entitled *A Study of Communism*, revealing much data on Communist subversive activities in the United States. The states of Florida and Louisiana have required compulsory courses about communism in high schools. Such courses were widespread in several other states, and many more states were in the process of introducing them.

COMORO ISLANDS

Comprising four main islands (Grand Comore, Mayotte, Anjouan, and Mohéli) situated in the Indian Ocean off the coast of Africa, the Comoro Islands are a French overseas territory with an area of 838 square miles, and a population (1961 est.) of 185,000. Most of the inhabitants are Muslims of Arab-African-Malagasy descent. Dzaoudzi (pop., 3,000), on Mayotte, is the capital. Legislative power is vested in a 31-member Territorial Assembly elected by universal suffrage. Executive power is exercised by a Government Council and a French-appointed high commissioner (Louis Saget). On Dec. 12, 1961, the French Parliament approved complete internal autonomy for the Comoros. In 1960–61 there were 48 primary schools (with 4,377 pupils), and 2 secondary schools (177 pupils).

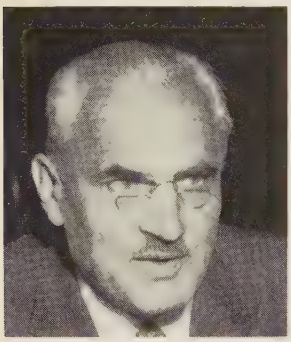
The economy is based primarily on subsistence agriculture. In 1961, exports totaled 686 million francs CFA; imports, 909 million (246.85 francs CFA equal U.S.$1). Major exports (in million francs CFA, 1961): vanilla, 265; perfume oils, 232; copra, 123; and sisal, 31. Major imports are rice and other foodstuffs. Principal trading partners are France and the Malagasy Republic. The Comoro Islands have a road network aggregating 435 miles, of which 370 miles are all-weather roads. Dzaoudzi is the principal port. There are four airports. Air France provides interisland service and overseas flights to France.

COMPTON, Arthur Holly

U.S. physicist and educator: b. Wooster, Ohio, Sept. 10, 1892; d. Berkeley, Calif., March 15, 1962.

Throughout his distinguished career as a scientist who made many contributions to nuclear physics, Arthur H. Compton retained his concern for education and for human welfare.

Compton was the youngest son of a Presbyterian minister who was dean of the College of Wooster. His older brothers Karl and Wilson became presidents of Massachusetts Institute of Technology and Washington State College, respectively. Compton received his bachelor's degree from Wooster (1913) and did graduate work in physics at Princeton University, where he received his Ph.D. in 1916. During World War I, after teaching physics for a short time at the University of Minnesota, he was a research engineer for the Westinghouse Lamp Company and helped develop aircraft instruments for the Signal Corps. In 1919–20 he studied physics at the Cavendish



Arthur Compton (1892–1962)

UPI

Laboratory at Cambridge University under the atomic scientist Ernest Rutherford.

After returning to the United States, he became head of the Physics Department at Washington University in St. Louis (1920), then professor of physics at the University of Chicago (1923) and dean of its Division of Physical Science (1940). His brilliance in physical experiment and theory was demonstrated with his discovery of the variation in wavelength of X-rays when scattered, and his interpretation of this Compton effect, as it came to be known, in terms of photons of radiation led to advances in quantum physics. For this work he was awarded the Nobel Prize in physics in 1927, sharing it with Charles T. R. Wilson of Scotland, who had invented the Wilson cloud chamber.

Compton and his associates also discovered the total reflection and polarization of X-rays, and he obtained the first X-ray spectra with finely ruled diffraction gratings. As director of the world survey of the mysterious cosmic rays (1931–34), he determined their variation with altitude above, and latitude on, the earth, and went on to discover their particle composition and tremendous energies. Early in World War II he became involved in the Manhattan Project on nuclear fission for bombs and, as head of the project's Metallurgical Laboratory at the University of Chicago, directed the government's research in plutonium. He initiated and directed the development of the first nuclear chain reaction and the first quantity production of plutonium.

Compton subsequently served as chancellor of Washington University from 1945 to 1953, and then as distinguished service professor of natural philosophy until 1961, when he became professor-at-large in order to divide his services among Washington and California (at Berkeley) universities, and the College of Wooster. Typically, while he wrote numerous scientific articles and the technical *X-Rays in Theory and Experiment* (1926; 2d ed. with S. K. Allison, 1935), he also contributed such nontechnical books as *The Freedom of Man* (1935); *Human Meaning of Science* (1940); and *Atomic Quest; A Personal Narrative* (1956).

CONFECTIONERY

United States sales of confectionery and competitive chocolate products in 1961 totaled $1,232 million in value, according to the U.S. Bureau of the Census. This figure was 2% higher than the 1960 total of $1,204 million. Data in the accompanying table represent more than 92% of manufacturers' total sales in 1961.

CONFECTIONERY AND CHOCOLATE PRODUCTS: SALES BY TYPES OF PRODUCTS, 1961[1]

Type of product	Pounds (1,000)	Value ($1,000)
Package goods:		
$1.00 or more per lb.	115,392	$ 116,145
$0.50 to $0.99 per lb.	266,303	124,018
Less than $0.50 per lb.	695,106	188,975
Bar goods	1,033,997	420,997
Bulk goods	637,252	186,448
5¢ and 10¢ specialties	272,980	114,850
Total	3,021,030	$1,151,433

[1] Excluding manufacturer-retailers' sales.

Sales in 1962 through September were estimated at $874,586,000, 2% above the 1961 level.

CONGO, Republic of (Brazzaville)

The Republic of Congo[1] (formerly the French overseas territory of Middle Congo in French Equatorial Africa) is an independent member of the French Community (q.v.), situated on the Atlantic coast of west-central Africa. Area (est.): 132,000 square miles; population (1960 est.): 900,000, predominantly Bantu and including 10,600 Europeans (1959 est.), mainly French. Chief cities: Brazzaville, the capital (1961 est. pop., 133,700); and Pointe-Noire (1958 est. pop., 57,700), an important seaport.

Government.—Independence was declared on Aug. 15, 1960. The premier and his cabinet are responsible to a National Assembly of 61 members elected by universal suffrage for 5-year terms. Party seating in the Assembly (following national elections of June 14, 1959): Democratic Union for the Defense of African Interests, 51 seats; African Socialist Movement, 10. Fulbert Youlou, leader of the victorious party, was chosen as president by the National Assembly in 1959, and was re-elected to a 5-year term by popular vote in 1961 with the support of all main parties. He is also premier, minister of defense, and minister of interior. Congo is a member of the Union of Central African Republics.

Education and Religion.—About 20% of the population was literate in 1961. School enrollment (1961), 133,366, including: primary, 125,000 (about 80% of the elementary school-age population); secondary, 3,061; teacher-training, 3,274; secondary technical, 560; vocational, 1,250; university, 221. The Congolese are mostly animists, although Christianity has made many converts.

Finance.—The 1961 budget totaled about 6 billion francs CFA, or $24.5 million (246.85 francs CFA equal U.S.$1). Government personnel costs accounted for nearly half of total expenditure; less than 7% ($1.5 million) was allocated for economic development, which is heavily dependent on aid from France ($12.3 million in 1961) and the Common Market Development Fund ($6.6 million). Taxes and duties on imports supplied nearly half of all revenues.

Transportation and Communications.—The 318-mile Congo-Ocean Railroad from the river port of Brazzaville to Pointe-Noire is the only line in former French Equatorial Africa, but a connecting railway and cable line to the manganese and uranium mines near Franceville, Gabon, was completed in October 1962. There are 4,340 miles of per-

[1] For purposes of distinction, this country is referred to herein as the *Republic of Congo*, whereas the former Belgian Congo, now an independent republic, is called the *Republic of the Congo*. Both countries are often referred to simply as Congo or the Congo.

Leading figures in the continuing civil strife in the Republic of the Congo in 1962 were Moise Tshombe (l.), president of secessionist Katanga Province, and Cyrille Adoula, premier of the central government, shown here meeting President Kennedy in Washington on February 5.

manent roads (238 miles hard-surfaced). The chief airports are at Brazzaville and Pointe-Noire. Radio Brazzaville is a major world broadcasting center; 10,000 radio receivers were licensed in 1959.

Agriculture.—Agriculture is the mainstay of the economy. Subsistence crops (manioc, fruits, vegetables) and cash crops for local use (sugar, rice for fodder) comprise 75% of total production. Chief agricultural exports (in order of value with 1960 metric tonnage): palm kernels (6,515); palm oil (3,533); peanuts, including shelled nuts (2,960); peanut oil (902); and cacao (521).

Industry.—The wood- and sugar-processing industries are important, but total industrial production accounts for only 11% of the national product. Crude oil, produced since June 1960 (102,900 metric tons exported in 1961) has overtaken lead (6,000 metric tons) as the principal mineral export; lead production declined 22% from 1960. The Kouilou River dam and hydroelectric plant, on which construction began in 1961 with French aid, will eventually supply 820,000 kw. of electricity, permitting development of metallurgical and chemical industries in the Pointe-Noire area.

Foreign Trade.—Exports, 1961: 4,841 million francs CFA (up 10% from 1960); imports: 19,518 million (up 12%). These figures include an unknown value of goods to and from other members of the Central African customs union using Congolese ports, but exclude trade between Congo and the union. Lumber sales provided about two thirds of total export value. France accounts for nearly 70% of the Congo's trade.

Events, 1962.—Vice President Jacques Opangault, leader of the opposition African Socialist Movement in the 1959 elections, resigned in April, charging his exclusion from power in President Youlou's "national" government, which he had joined in August 1960. Opangault remained in the cabinet, however, as minister of public works, transportation, and tourism.

President Youlou proclaimed a state of emergency on September 24 after mobs of Congolese had killed several Gabonese citizens and injured 40 others in Pointe-Noire. The rioting broke out after mobs in Libreville, Gabon, had mistreated Congolese citizens and the Gabonese government had expelled all Congolese from the country. The violence stemmed from the disputed results of a soccer game between teams representing the two nations.

R.N.M.

CONGO, REPUBLIC OF THE (LÉOPOLDVILLE)

The Republic of the Congo (formerly the Belgian Congo before becoming independent on June 30, 1960) is situated in central equatorial Africa, with a narrow outlet on Africa's west coast. The country's estimated area of 905,370 square miles includes the vast central basin of the Congo River. The population of 14,450,000 (est. June 30, 1961) comprises mostly Negroes who speak a Bantu language, and about 45,000 Europeans (est. 1960), mainly Belgian. About 77% of the population lives in tribal communities, and the remainder in commercial and industrial centers. Principal cities (with estimated 1959 populations): Léopoldville (390,000), the federal capital and principal commercial center; Elisabethville (183,000), capital of Katanga Province in the southeast; and Stanleyville (80,000), in the northeast.

Government.—Under the *loi fondamentale*, or basic law, which took effect on June 30, 1960, the central government of the republic is headed by a titular president and is governed by a premier and cabinet responsible to a bicameral Parliament. The latter consists of a Chamber of Deputies of 137 members elected directly by universal male suffrage, and a Senate of 84 members chosen by provincial assemblies. Party seating in the Chamber of Deputies (following national elections in May 1960): the left-wing Congolese National Movement of Patrice Lumumba, 41 seats; the pro-Belgian National Progress Party, 22; the leftist African Solidarity Party, 13; and the conservative Association of the Bakongo (ABAKO), 12. Joseph Kasavubu, leader of ABAKO, has served as president of the republic since its founding. Cyrille Adoula, a moderate and independent nationalist leader, was elected by Parliament as premier of a coalition cabinet on Aug. 2, 1961.

Operation of the *loi fondamentale* has been impeded since independence by the temporary secession from the central government of Katanga, South Kasai, and Orientale provinces. As the result of a breakdown in public order following the chaotic events immediately after proclamation of the republic, a United Nations Force (aggregating 15,288 troops as of Sept. 1, 1962) has been stationed in the Congo since July 1960 to preserve peace and promote political stability. Robert K. A. Gardiner of Ghana was named chief of the UN Operation in the Congo on Jan. 26, 1962; he succeeded Sture C. Linner of Sweden, who had resigned.

Education and Religion.—Educational enrollment, 1959: 1,500,564 (about 30% of the school-age population). Number of schools (with enrollments, 1959): 15,970 primary (1,460,753); 107 secondary (13,858); 61 technical (6,480); 217 teacher-training (18,991); and 2 universities (482). Institutions of higher learning are the State University at Elisabethville, and the University of Lovanium near Léopoldville. In early 1962 some 853 Congolese students were studying at higher institutions in Belgium. Christian mission schools form an important part of the educational system. Most Congolese, particularly among the tribal population, are animists. Roman Catholics are estimated at 4.5 million; Protestants, 825,000; Muslims, 150,000.

Finance.—The federal budget for the calendar year 1962 (the first formal budget since independence) estimated total revenues at $150 million, and expenditures at $382 million. The budget deficit of $232 million was financed partly by advances from the United Nations and the Congolese Central Bank. United Nations expenditure in the Congo totaled $135 million in 1961. United States economic aid to the Congo since independence amounted to about $83 million by mid-1962. Gold and foreign exchange holdings of the Central Bank: $72 million at the end of 1960 ($87 million at the end of 1959). The Congolese franc equals U.S.$0.02 at the official rate, but since mid-1960 it has fluctuated widely in value on the free market.

Transportation and Communications.—The transportation system is largely inadequate to the needs of the vast country. Transport networks (miles, 1958 est.): public railways, 3,200; main roads, 22,000; navigable waterways (the Congo River and its tributaries), 8,540. The chief seaport is Matadi, situated at the mouth of the Congo River. There are five international airports and numerous secondary and local airfields. Sabena provides external air service to other points in Africa and to Europe; local companies provide internal services. Other data for 1959: passenger cars, 38,100; commercial vehicles, 22,400; telephones, 28,278 (1960); radio receiver licenses, 35,000.

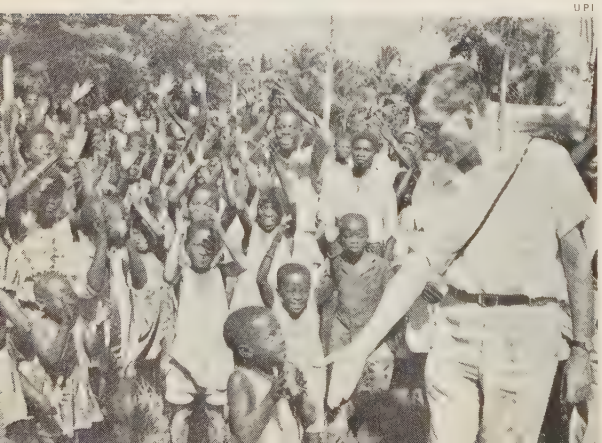
Agriculture.—About three fourths of the population engages in agriculture, hunting, and fishing. Total national income was valued at 48,185 million francs in 1959. Chief subsistence crops are manioc, maize, sweet potatoes, rice, sorghum, peanuts, bananas, and other food staples. Principal cash crops (with estimated outputs in the 1961–62 crop year): coffee (750,000 bags of 132.3 pounds each); cotton (90,000 bales of 480 pounds each); palm oil (176,368 short tons exported); and rubber (38,000 metric tons exported). The country's vast tropical forests yield hardwoods, cinchona bark, ivory, derris, and skins.

Minerals and Manufactures.—The Congo is an important producer of minerals, deposits of which are concentrated largely in Katanga Province. Chief minerals (metric tons, 1961): copper, 288,000 (down 4% from 1960); zinc, 57,000 (up 7%); tin, 2,400 (down 33%); cobalt, 9,300 short tons (up 2%); manganese, 390,000 (1960); and industrial diamonds, 18 million metric carats. Other minerals include tungsten, cadmium, radium, uranium oxide, and gold. Principal manufactures include processed foods, building materials, chemicals, soap, textiles, footwear, and glassware. Electric power production in 1958 totaled 2,519 million kw.-hr.

Foreign Trade.—Congolese exports, 1961: 5,912 million francs; imports: 6,514 million (figures exclude trade of Katanga, Kivu, Orientale, and South Kasai provinces; imports include 404 million francs for United Nations account). Chief exports are copper, coffee, manganese, cotton, and palm oil; imports are mainly foodstuffs, steel products, machinery, and other manufactures. The Congo's chief trading partners are Belgium, the United States, Great Britain, and West Germany.

Events, 1962.—For the first time since independence the Congo underwent an extended period of peace and stability in the year 1962. The chaotic and violent events that had plagued the nation in 1960 and 1961 continued to occur briefly in January 1962, but after that the country was relatively quiescent except for severe fighting between United Nations and Katangese troops in late December. During the year the Congolese central government, with the aid of the United Nations Force in the Congo, made progress in its efforts to end the secession of Katanga Province and to hold other provinces within its jurisdiction.

Congolese children in the remote village of Shabunda greet Anthony Gilpin, chief of a United Nations air mission to the Congo which provided medical care, administration, assistance with public works projects, and various supplies.



In January the central government of Premier Cyrille Adoula successfully thwarted the threatened secession of Orientale Province. The federal Chamber of Deputies on January 8 directed Antoine Gizenga, federal deputy premier and leftist political leader in Stanleyville, to return to Léopoldville and answer accusations of alleged secessionist activities. Gizenga's forces attempted to seize military control of Stanleyville on January 13–14, but were defeated by troops loyal to the Léopoldville regime. The central government immediately censured Gizenga and dismissed him as deputy premier. The UN Force placed Gizenga under "protective custody" and on January 20 flew him to Léopoldville, where he was arrested and imprisoned by the central government. The leftist regime which Gizenga and the late ex-Premier Patrice Lumumba had established in Orientale Province ceased to function, principally because of the apparent lack of public support.

It was revealed on January 17 that mutinous Congolese troops supporting Gizenga had murdered 22 European Roman Catholic missionaries at Kongolo in northern Katanga on January 1. The alleged murderers were captured later in the month by central government troops. Further incidents of violence continued to occur sporadically in Katanga. United Nations troops and Katanga forces exchanged gunfire at Kaminaville on March 5; Katangese women, at the instigation of the Tshombe government, on July 19 stormed a United Nations roadblock at Elisabethville; and on August 17, federal forces and Katanga troops clashed near Albertville. At the end of the year the UN Force decisively defeated the Katanga forces in pitched battles in Elisabethville and at other key points in Katanga.

Early in the year the Adoula government moved to end the secession (since July 11, 1960) of Katanga Province by implementing the Kitona agreement (Dec. 21, 1961), signed by Premier Adoula and Katanga President Moise Tshombe, to reintegrate the province within a unified Congo. Tshombe, the conservative and erratic leader of the secessionist province, continued to hedge on effecting the principal provision of the agreement, acceptance of the *loi fondamentale* or provisional constitution, but he did agree in late January to observe another vital point of the agreement, the expulsion of foreign mercenaries from Katanga's armed forces. Nearly all (about 300) of the mercenaries were reportedly expelled from Katanga by mid-February.

After the Katanga Assembly conditionally approved on February 15 the ending of secession provided the province retained a large measure of autonomy, Adoula and Tshombe conferred in Léopoldville from March 18 to April 17, and again from May 22 to June 26. They failed to agree on how reunification should be brought about, although an agreement to integrate Katanga's armed forces within the Congolese Army was announced on May 30. The leaders also agreed on the composition of separate commissions to prepare plans for reintegration in military, monetary, and economic affairs. It was apparent from reports on the negotiations, however, that Tshombe had not completely abandoned his hopes of retaining Katanga's independence, while Adoula was just as adamant in demanding Katanga's surrender of full sovereignty to the Congolese central government.

Premier Adoula sought and received the support of other countries for his policy of reintegra-

tion when he visited the United States in early February. In an address to the UN General Assembly in New York on February 2, he appealed for more military aid in order that his government might have the means to end Katanga's succession. Adoula conferred with President Kennedy in Washington on February 5 and reportedly was assured that the United States would continue to support his efforts to unify the Congo. He also discussed Congolese problems with U Thant, acting secretary general of the United Nations, and with Belgian and Soviet officials during his stay in New York.

Adoula strengthened his control of the government by dismissing extremist ministers of both left and right, and by nominating moderate supporters to important posts in a cabinet reshuffle announced on July 11. He reduced the number of ministers in the unwieldy 43-member cabinet by nearly half, and the change was approved by the Chamber of Deputies on July 16 after extended debate. The Adoula government narrowly survived a vote of "no confidence" in the Chamber on November 28. An opposition motion to topple the government fell only 16 votes short of the required two-thirds majority for adoption. The close vote indicated that Premier Adoula would have difficulty in obtaining future legislative support.

The central government moved in early August to force reunification by putting economic pressure on Katanga. The Léopoldville regime on August 7 banned unauthorized air travel to Katanga, cut telecommunications between the province and the outside world, and warned foreign firms in the country that they would no longer be "permitted" to support Katanga's secession and still do business in other parts of the Congo.

In the same month UN Acting Secretary General U Thant appealed to United Nations members to consider the use of economic sanctions against Katanga. He suggested that Union Minière du Haut-Katanga, the European-controlled mining company which produces three fourths of the Congo's minerals (valued at $220 million in 1961) and provides important revenues to Katanga (an estimated $40 million in 1961), should pay no more taxes to the province until reunification of the Congo was achieved. The use of economic pressures was supported by the United States and Belgium. On November 27 the two nations warned that "severe economic measures" against Katanga would be taken unless progress on reunification was achieved shortly.

A plan to end Katanga's secession was proposed by U Thant on August 24. The plan called for Katanga and the federal government to share equally all provincial revenues, and to reunify the Katangese and Congolese armed forces. These proposals were incorporated in a new federal constitution prepared by United Nations legal experts and introduced by Premier Adoula on October 16 to replace the country's *loi fondamentale* of 1960. The new constitution would retain the present structure of government; would place the Congo's armed forces, foreign affairs, and financial policy firmly under control of the central government; and would permit considerable autonomy by the provincial government in matters of education, legal systems, police powers, taxation, and other local affairs. It would allow the central government to assume control of a province in an emergency, however.

Although Tshombe at first welcomed U Thant's plan as "the basis of an acceptable settlement" for reunification, he later declared that the plan was but a ruse for an attempt to overthrow his regime. In mid-September he charged that the central government, assisted by the UN Force, was preparing to launch a "general attack" in northern Katanga. United Nations authorities denied the allegations. Robert K. A. Gardiner, chief of the UN Operation in the Congo, reported on October 9 that the Katanga government had greatly increased its air power and had recalled some 300 foreign mercenaries.

The heaviest fighting in the Congo in more than a year took place between the UN Force and Katanga forces in Elisabethville on December 28. In response to alleged attacks by Katangese gendarmes, United Nations troops seized control of the city by the following day, and then captured Kamina, Jadotville, and other key posts within the week. U Thant on December 31 issued an ultimatum giving Tshombe two weeks to negotiate Katanga's reunification. Tshombe at first fled to Southern Rhodesia, then returned to his last remaining stronghold of Kolwezi, where on Jan. 15, 1963, he capitulated and proclaimed that "Katanga's secession is ended."

President Joseph Kasavubu on August 16 promulgated laws creating 16 new provinces out of the five provinces under control of the central government. Territories of the new provinces were designated along tribal lines. The effect of the new alignment was to ease acute tribal tensions where hostile tribes were located in the same province, but it also indicated the failure of the central government to create among the people a strong national consciousness to replace their deep tribal loyalties. The names of the new provinces were as follows: Congo Central, Kwilu, Kwango, and Maindombe (all formerly comprising Léo-

poldville Province); Lomami, Luluabourg, Sankuru, South Kasai, and United Kasai (formerly Kasai Province); Cuvette Central and Ubangi (formerly Equateur); Kilbali, Ituri, and Uele (formerly Orientale); and Maniema and North Kivu (formerly Kivu). In addition, Parliament in early July approved the creation of the new province of North Katanga.

The economy of the Congo continued to be adversely affected in 1962 by Katanga's secession and by the aftermath of the chaotic political conditions of previous years. Unemployment was widespread and inflation was rampant. The central government operated with large budget deficits, and administrative services and transportation facilities remained impaired. Difficulties in importing raw materials and capital equipment hampered industrial production, and agricultural imports declined. Mineral production was continued at satisfactory levels. Although economic recovery was slow in 1962, the Congo has an excellent economic foundation for future expansion. The possible return of Katanga's tax revenues and foreign exchange holdings to the central government would improve considerably the country's budgetary position and greatly reduce its current balance of payments deficit. In a sense, therefore, economic developments in the Congo awaited the outcome of political events.

[1] Part of Danbury Town.

Government.—Chief executive and judicial officers in 1962 included John N. Dempsey (Democrat), governor, serving a four-year term; Anthony J. Armentano, lieutenant governor; Ella T. Grasso, secretary of state; Donald J. Irwin, treasurer; Raymond S. Thatcher, comptroller; Albert L. Coles, attorney general; William J. Sanders, commissioner of education; and Raymond E. Baldwin, chief justice of the 5-member Supreme Court.

The Connecticut General Assembly, which convenes in odd-numbered years, comprised 24 Democrats and 12 Republicans in the Senate in 1962 and 178 Republicans and 116 Democrats in the House of Representatives.

Finance.—In the 1961 fiscal year, revenue of $445,595,828 included $268,102,428 from state taxes and $60,684,446 in federal funds. Chief tax yields were the 3% general sales tax ($79,273,432) and taxes on corporate incomes ($30,771,132) and motor fuels ($48,406,530). Spending of $501,498,863 included $104,470,674 for education, $219,587,336 for health, welfare, and safety, and $116,978,206 for highways.

Education.—In the 1960–61 school year, public elementary schools staffed by 11,448 teachers enrolled 344,368 pupils; junior high schools with 2,223 teachers enrolled 47,403; senior high schools with 5,107 teachers enrolled 107,863; and private and parochial schools with 3,923 teachers enrolled 103,814. College enrollment (fall 1961) totaled 55,319 in 35 institutions, including 29 senior colleges and universities and 6 junior colleges.

Estimated public school spending in the 1961–62 school year was $276,450,000, including current expenditures of $226,800,000 ($497.36 per pupil) and capital outlays of $39 million. Revenue of $305.5 million was drawn chiefly from state funds ($98 million) and local districts ($168.5 million). Teachers' salaries averaged $6,150 (high school, $6,350; elementary, $5,750). Actual spending for higher education (fiscal year 1961) totaled $27,574,000.

Public Assistance.—In the 1961 fiscal year, public assistance payments to a monthly average of 23,964 persons totaled $42,925,707. This amount included $19,212,442 for the aged and $16,013,073 for dependent children.

Transportation and Communications.—With 85 miles of highway construction and reconstruction completed in 1961, *highways and roads* on Dec. 31, 1961, totaled 16,907 miles (15,606 hard-surfaced). These served 535,271 *motor vehicles* (as registered on June 30, 1962), including 324,351 automobiles. Operating in the state in 1961 were 3 *railroads* (using 820.29 line miles of track) and (1962) 7 regularly scheduled *airlines* and 1 helicopter airline. There were (1962) 28 commercial and municipal *airports* and 9 heliports.

Communications media included (1962) 33 AM and 11 FM *radio stations;* 2 VHF and 5 UHF *television stations;* 26 daily *newspapers* (1961 circulation, 806,805) and 91 other newspapers; and (Jan. 1, 1962) 367,100 business and 983,400 residential *telephones.*

Labor Force.—The state's labor force in June 1962 included 18,600 agricultural workers. Nonagricultural employment totaled 949,660, compared with 929,110 a year earlier and an average of 922,050 for the calendar year 1961. Of nonfarm employees, 43.4% were in manufacturing, 17.9% in trade, and 12.7% in service industries. Unemployment in June 1962 was down to 58,300 from the 77,100 reported for the previous June.

Manufacturing.—Manufacturing engaged 408,966 workers in 1960, including 295,019 in production, and provided a payroll of $2,233,974,000. Adjusted value added by manufacture totaled $3,779,137,000.

LEADING CONNECTICUT MANUFACTURES, 1960

Industry group	Total employees	Total payroll (thousands of dollars)	Adjusted value added by mfr.[1] (thousands of dollars)
Transportation equipment	70,867	$457,651	$663,985
Nonelectrical machinery	60,533	347,556	601,640
Electrical machinery	40,388	203,979	393,638
Fabricated metals	45,003	232,217	385,783
Primary metals	25,730	148,811	274,946
Chemicals and products	10,110	60,453	181,644
Rubber and plastics products	15,904	82,062	152,951
Food and kindred products	14,208	69,692	150,982
Instruments and related products	16,644	89,871	149,913
Printing and publishing	15,962	93,322	142,607

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—In 1961, Connecticut ranked 45th among the states in the value of its mineral output, with 0.09% of the national total. The value of $16,501,000 (topping by 3% the record set in 1957) was attributed mainly to increased construction. Leading minerals were stone (valued at $8,616,000) and sand and gravel ($6,633,000).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $101,921,000, compared with

CONNECTICUT CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	1,285	1,450	1,220
Corn for grain (1,000 bu.)	210	132	140
Potatoes (1,000 cwt.)	1,392	1,495	1,472
Tobacco (1,000 lb.)	18,528	11,422	11,036
Tomatoes (1,000 cwt.)	34	182	188

(Source: U.S. Department of Agriculture.)

$106,142,000 for the corresponding period of 1961. For the full year 1961 income comprised $93,903,000 from livestock, $47,998,000 from crops, and $590,000 in government payments. Principal income sources in 1961 were wholesale milk, $38,080,000; eggs, $26,952,000; and tobacco, $18,382,000.

Events, 1962.—The November elections resulted in a complete Democratic sweep of all state offices. John N. Dempsey was reelected governor by a margin of 66,175 votes over his Republican opponent, John Alsop. Incumbents Ella T. Grasso, secretary of state, Raymond S. Thatcher, comptroller, and Albert L. Coles, attorney general, were reelected, with the other two elective offices being won by Samuel J. Tedesco, lieutenant governor, and Gerald A. Lamb, treasurer.

Democrat Abraham A. Ribicoff, former governor and United States secretary of health, education, and welfare, defeated Horace Seely-Brown for the U.S. Senate seat of retiring Prescott Bush, Republican. Five of the six seats in the U.S. House of Representatives were won by Democrats. In the state Senate the Democrats retained control with 23 seats against 13 for the Republicans; the House of Representatives remained strongly Republican, with 188 Republican to 106 Democratic seats.

All five state constitutional amendments were approved by the voters. These provided for: (1) voting by absentee ballot on future constitutional amendments; (2) the pairing of governor and lieutenant governor on each party ticket so that they will be voted on as a unit; (3) the elimination of re-registering when a voter moves to another town within the state; (4) the transfer of authority for the method of new voter registration from local elector boards to the General Assembly; and (5) *in absentia* voter registration of armed forces members and those in related services.

Two important committees were appointed by Governor Dempsey early in the year—one to study the feasibility of establishing a major research center, and the other to survey library services at all levels in the state. In August a 107-acre site was selected in Farmington for the University of Connecticut's new medical-dental school, and in October construction began on its law school at the new 58-acre location in West Hartford. Two leading institutions of higher learning welcomed new presidents: Connecticut College inaugurated Charles K. Shain at New London on October 19, and the University of Connecticut inaugurated Homer D. Babbidge, Jr., at Storrs on October 20.

The economy of Connecticut continued strong during the year with all major business indicators, except construction activity, at or near all-time highs. The manufacturing output index registered the highest August level since 1956 and the third highest on record. Bank debits, the measure of general business, rose in August to make it the second highest month on record, exceeded only by the previous May.

An atomic plant for electric power principally for Connecticut was to be built at Haddam Neck, to be owned and operated jointly by 12 New England utility companies. Construction began in the fall to double the research facilities of the state's largest employer, United Aircraft. A 7,000-ton Polaris submarine, the *Alexander Hamilton*, was launched at Groton, August 18.

Over 50 urban renewal projects were in various stages of activity, with Hartford and New Haven leading in the redevelopment programs. Hartford won the All America City Award in 1962 for its Constitution Plaza project.

With appropriate pomp and ceremony, the newly completed St. Joseph's Cathedral at Hartford was dedicated on May 23. It replaces an edifice that was completely destroyed by fire on the last day of 1956. Two major events occurred in the television field in 1962. After a three-year trial, the first subscription television system in the United States went into operation in Hartford in June; and educational television was inaugurated from Trinity College, Hartford, in October.

CONSERVATION OF NATURAL RESOURCES

The year 1962 was a banner year for conservation in the United States generally, and was especially notable for unprecedented developments involving outdoor recreation resources and wildlife conservation.

Bureau of Outdoor Recreation.—On Jan. 31, 1962, after more than three years of investigation and study, the Outdoor Recreation Resources Review Commission (ORRRC) transmitted its findings and recommendations to the president and the Congress in a report titled *Outdoor Recreation for America.* Among other recommendations, the ORRRC urged the establishment of a Bureau of Outdoor Recreation and the creation of central authority to ensure the comprehensive, unified development of outdoor recreation resources to meet national needs through close coordination of federal agencies actively involved, and cooperation with the several states.

In his message on conservation, delivered to the Congress on March 1, 1962, President Kennedy reiterated several salient proposals in the ORRRC report and requested legislation to implement them.

On April 2, Secretary of the Interior Stewart Udall established, by secretarial order, the Bureau of Outdoor Recreation in the Department of the Interior. Specific responsibilities of the new bureau were delineated as follows: (1) coordination of related federal programs; (2) stimulation of and provision for assistance to the states; (3) sponsorship and conduct of research; (4) encouragement of interstate and regional cooperation; (5) conduct of recreation resources surveys; and (6) formulation of a nationwide recreation plan on the basis of state, regional, and federal plans. Dr. Edward C. Crafts was appointed director of the new bureau, effective April 23.

The bureau will coordinate the outdoor recreation activities of some 20 federal agencies, but will manage none of the land involved. It will cooperate with all the states and lend them advisory and financial assistance toward optimal development and utilization of outdoor recreation resources.

Recreation Advisory Council.—On April 27, 1962, President Kennedy issued Executive Order 11017, providing for coordination with respect to outdoor recreation resources and establishing the Recreation Advisory Council. The council is composed of the secretaries of the interior, agriculture, defense, and health, education, and welfare, and the administrator of the Housing and Home Finance Agency. It is charged with providing broad policy advice to the heads of federal agencies on all important matters affecting outdoor recreation resources, and with facilitating coordinated efforts among the various federal agencies.

White House Conference.—On May 24–25, 1962, the president convened a White House Conference on Conservation, the first since the meeting of state governors called by President Theodore Roo-

sevelt in 1908. The problem of affording adequate outdoor recreation opportunities was, once again, a theme of major emphasis.

In addressing the conference, Secretary Udall asserted that resource problems require a unified approach and intelligent conflict resolution. He said in part: ". . . controversy between park enthusiasts and hydroelectric power advocates, dam builders and salmon fishermen, industrial needs and scenic values—all of these will become more frequent and more divisive unless we construct and adhere to a higher order of conservation statesmanship. . . . Social values must be equated with economic values; the overriding need of man for an environment that will renew the human spirit and sustain unborn generations requires some sacrifices of short-term profits. . . . Education is the key, both to the techniques and ethics of conservation."

Secretary of Agriculture Orville L. Freeman predicted that the United States will need 50 million fewer acres of crop-producing land in 1980 than are currently cultivated, and announced his department's readiness to cooperate with private land owners and local communities in new combinations of land utilization, including outdoor recreation.

Waterfowl Wetlands.—The emergency acquisition of wetlands for ducks by the Bureau of Sport Fisheries and Wildlife, authorized by Public Law 87–383 (Oct. 4, 1961) and implemented with a Treasury Department loan of $105 million expendable over a seven-year period, began slowly. As of July 1962 the bureau had obligated funds for the purchase of 11,682 acres (8,887 in North Dakota, 2,092 in South Dakota, and 703 in Minnesota) and lease of 4,968 acres (3,480 in North Dakota and 1,488 in South Dakota). Meanwhile, funds were obligated during the fiscal year 1962 for acquisition of additional waterfowl refuge areas aggregating 18,915 acres. The wetlands procurement program was obstructed by a proviso in P.L. 87–383 that the federal government might, under that law, neither purchase nor lease such land without consent of the state government within whose jurisdiction the land lies.

Most desired by the Bureau of Sport Fisheries and Wildlife were certain perennially wet potholes and marsh areas in the Dakotas and western Minnesota. These are breeding grounds for a considerable fraction of the North American duck population; they are also choice shooting grounds, and taxable assets, wet or dry. For those reasons the state governors were reluctant to relinquish them, although the projected federal purchases in any one of the three states would be a very small fraction of the states' total land area.

The wetlands acquisition program was frustrated by conflicting legislation. While the Bureau of Sport Fisheries and Wildlife sought duck habitats suitable for its purposes, the Soil Conservation Service continued its responsibility to assist with the artificial drainage of potholes and marshes to promote their agricultural utility.

Silting and filling have been even more detrimental than drainage to duck breeding grounds in certain morainic areas. During almost a century of inept cultivation on surrounding hills, many sloughs once productive of mallards have been depositories for erosion silt and receptacles for glacial stones and boulders. Their rehabilitation for ducks by excavation and revegetation might in many cases be more economical than to reserve for waterfowl such wet areas as would, with proper drainage, become highly productive and thereby enhance the human habitability of established farm units. An arbitrary choice between duck habitat and farm improvement was deliberately deferred by the Congress.

However difficult its initiation, the wetlands procurement program represents a profound change of concept with respect to wild waterfowl. Less and less may Americans rely on privately owned farmland to maintain desirable populations of migratory game birds.

Pittman-Robertson Act Anniversary.—Sept. 2, 1962, marked the 25th anniversary of the highly successful conservation program officially identified as the Federal Aid in Wildlife Restoration (Pittman-Robertson Act). The act provides for the collection of an 11% excise tax on sporting arms and ammunition and the distribution of such monies to finance (up to 75% of cost) approved wildlife restoration projects in the several states. (A comparable program for fish restoration, under the Dingell-Johnson Act, began in 1950. Its funds come from an 11% excise tax on sports-fishing gear.)

Under the Pittman-Robertson Act, almost $219 million was apportioned to states and territories from July 1, 1938, through June 30, 1961. Some 2,374,000 acres of land have been purchased by 47 states through this program, for wildlife management and public hunting areas. The first federal aid project was on the Ogden Bay Waterfowl Area in Utah.

Conservation Districts Anniversary.—The Soil Conservation Districts system also reached the quarter-century mark in 1962. Although Arkansas was the first state to pass enabling legislation for creating such districts (March 3, 1937), the first organized was the Anson County (Brown Creek) Soil Conservation District in North Carolina (Aug. 4, 1937). In 1962 the number of districts throughout the United States approached 3,000, encompassing about 96% of the nation's agricultural land—1.7 billion acres on some 3.6 million farms and ranches. Twenty-four states had been organized into districts in their entirety. Meanwhile, the Soil Conservation Service also had 384 projects operative under Public Law 566, the Watershed Protection and Flood Prevention Act.

CONSUMER CREDIT

At the end of the first three quarters of 1962, consumer credit in the United States was at an all-time peak of $59.2 billion—an increase of $2.1 billion above the previous peak of December 1961, and $4.4 billion above the September 1961 level. A rapid expansion of such credit (credit extended to individuals for household and personal expenditures, except real estate mortgage loans) began in April and consisted largely of the increased use of installment credit. It was substantial, but fell short of the increases experienced in the two previous periods of business recovery.

Total disposable personal income (personal income remaining after payment of personal taxes and the like) increased substantially in the first three quarters of the year, but unemployment remained relatively high and the income position of many consumers improved only moderately. Incomes generally, however, were favorable enough to support a substantial increase in consumer expenditures, but nearly all of the increase was for

nondurable goods and services—items involving less consumer credit in their sale than durable goods, the basis of much installment credit.

The total consumer credit outstanding in September 1962 represented about 15% of total disposable personal income, approximately the same ratio as a year earlier. Since 1954, consumer credit has varied from 13 to 15% of disposable personal income—a ratio slightly higher than in the years before World War II. Personal saving was 6.9% of disposable personal income in the first three quarters, approximately the same as in 1961. (See also SAVINGS.)

Status of Consumer Credit, December 1961.—At the end of December 1961 the major portion of the $57.1 billion of consumer credit was installment credit totaling $43.2 billion. It consisted of $17 billion of installment sale credit on automobiles, provided mostly by commercial banks and sales finance companies, and a relatively small portion by other financial institutions and automobile dealers. Installment credit for other consumer goods (secured usually by the items purchased, and including revolving credit plans of retail stores) amounted to $11.8 billion, and was provided about equally by commercial banks, sales finance companies, and retail outlets such as department and furniture stores. Repair and modernization installment loans for owner-occupied dwellings totaled $3.2 billion, extended mostly by commercial banks. Personal loans (signature-alone borrowing) of an installment type amounted to $11.3 billion, granted by commercial banks, sales finance companies, and other financial institutions —mostly by the latter (credit unions and consumer finance companies). Such personal loans are mainly for consolidation of consumer debt, medical and other emergency expenses, education, and travel.

The minor portion of the $57.1 billion of consumer credit was noninstallment credit of $14 billion. It consisted of $5 billion of single-payment loans extended almost entirely by commercial banks. Charge accounts at stores amounted to $5.4 billion (including balances owed on credit-card and home-heating oil accounts). Service credit, the amount owed by individuals to professional practitioners and service establishments for such items as medical care and public utility services, totaled $3.6 billion.

Trend in Consumer Credit, 1962.—At the end of September 1962, consumer credit was $2.1 billion, or 8.7%, above the level at the end of 1961, and 8.1% above the level of a year ago. Installment credit was 5.5% above the year-end level and 8.6% above the September 1961 level. Noninstallment credit was 2.9% below the year-end level, but exceeded the September 1961 level by 7.1%.

Automobile credit, the largest component in installment credit, showed an increase in September 1962 of 9.2% over the September–December 1961 level. Other durable goods credit declined in the first quarter, and then increased to a level in September about equal to the December 1961 level but 6.3% greater than in September 1961. Practically no change occurred in repair and modernization loans. Personal loans were 7.9% higher than in December 1961 and 10.9% higher than in September 1961. Commercial banks supplied slightly more than half of the total increase of installment credit during the first three quarters of 1962.

Of the three components constituting noninstallment credit, single-payment loans supplied mostly by commercial banks were about 6% higher in September 1962 than in December 1961, and about 10% over September 1961. Charge accounts at stores declined in the first quarter, and then rose to a level about 15% below the December 1961 level, but about 5% higher than a year earlier. Service credit increased slightly in the first part of the year and then declined to a level in September about 3% higher than in December 1961 and about 6% higher than in September 1961.

COPPER

World output of copper ore and concentrate rose from 4,640,000 short tons in 1960 to 4,850,000 tons in 1961, according to the U.S. Bureau of Mines. Of the total, the United States supplied 1,165,155 short tons, or 24%, in 1961 (23% in 1960). World output of smelter copper rose from 4,950,000 short tons in 1960 to 5,060,000 tons in 1961. The United States provided 1,207,354 short tons, or 24%, of the 1961 total (25% in 1960).

In the United States, output of recoverable copper in 1961 was 8% over 1960. In the first nine months of 1962, the total was 914,683 short tons, compared with 852,887 tons in the same period of 1961. Smelter output from domestic and foreign ores in 1961 totaled 1,207,354 short tons, against 1,233,629 tons in 1960, a decrease of 2%. In the first nine months of 1962, smelter copper totaled 990,121 short tons, against 877,403 tons in the same period of 1961.

The accompanying table shows United States mine production of copper by states for the period 1958–61.

MINE PRODUCTION OF COPPER BY STATES
(In thousands of short tons)

State	1958	1959	1960	1961
Arizona	485.8	430.3	538.6	587.1
California	0.7	0.7	1.1	1.4
Colorado	4.2	2.9	3.2	4.1
Idaho	9.8	8.7	4.2	4.3
Michigan	58.0	55.3	56.4	70.2
Missouri	1.4	1.1	1.1	1.5
Montana	90.7	65.9	92.0	104.0
Nevada	66.1	57.4	77.5	78.0
New Mexico	55.5	39.7	67.3	79.6
Tennessee	9.1	11.5	12.7	12.3
Utah	189.2	144.7	218.0	213.5
Others	8.8	6.6	8.1	9.2
Total	979.3	824.8	1,080.2	1,165.2

(Source: U.S. Bureau of Mines.)

Actual consumption of refined copper in 1961 rose 8% over that of 1960. Refined copper stocks in the United States declined 50%, to 49,000 tons, and stocks of unrefined copper decreased 10%, to 236,000 tons, the lowest point since 1955.

Imports of unmanufactured copper by the United States, continuing their downtrend, totaled 457,669 short tons (copper content)—13% less than in 1960 and the lowest since 1947. Imports of refined copper, also continuing to decline, were less than half of those in 1960. Chile remained the chief supplier with 226,971 tons, almost 50% of the total (9% more than in 1960). Peru, although supplying slightly less copper than in 1960, was second with 90,435 tons (almost 20%). Canada declined to third place with 78,354 tons, or 17% (33% less than in 1960).

Exports of refined copper declined from 433,762 short tons in 1960 to 432,253 tons in 1961. West Germany, the United Kingdom, Italy, Japan, and France were the main recipients. In the first nine months of 1962, exports of refined copper totaled about 260,000 tons, compared with 334,148 tons in the same period of 1961.

COST OF LIVING

The general level of prices in the United States and Canada was relatively stable in 1962. Prices in the United States having an effect on the cost of living increased slightly, but the average of wholesale prices increased only fractionally. A similar situation existed in Canada, except that wholesale prices showed a greater increase than retail prices.

United States.—The cost of living, as measured by certain retail prices, rose 1.5% in the United States during the first three quarters of 1962. In the same period the level of wholesale prices increased 0.8%. There was a steady increase in the cost of living except for unchanged averages in April–May and July–August. Consumer prices reached an all-time high in 1962. Wholesale prices in January 1962 were fractionally below the previous all-time high reached in the first quarter of 1961. They declined slightly in the first six months, and then rose appreciably in the third quarter to a new all-time high.

Demand for many consumer durable goods increased only moderately during the year, a notable exception being automobiles, with sales almost equal to the all-time record of 1955. Demand for nondurable goods also increased moderately, but the increase for services was substantial. Total consumer spending expanded each quarter of the year with the steady rise in total personal income. The rate of personal saving changed very little, but there was greater use of credit in making consumer purchases (see CONSUMER CREDIT).

Government expenditures, particularly those of the federal government for defense and related purposes, increased substantially the demand for many goods and services. All units of government, and particularly the federal government, enlarged appreciably their borrowings in order to finance the increase in expenditures.

Business investments increased moderately during the year and contributed to an enlarged demand for many kinds of producers' goods. Expenditures for new plant and equipment were about 8% more than in 1961. New residential construction increased appreciably to the highest level since 1959.

On the supply side of markets, there was no lack of capacity to make goods available. Total crop production was estimated to be about the same as in 1961 and only slightly below the record output for 1960. In industry, private investment in plant and equipment in recent years and in 1962 greatly expanded production capacity to meet present and prospective growth in demand. Partly as a result, many industries operated appreciably below their capacity in 1962. In some instances (such as rubber products, chemicals, and steel and aluminum products) the increased availability of supplies and vigorous competition among sellers were important in the downward movement of many wholesale prices.

Although employment improved appreciably as compared with 1961, there were no labor shortages, and substantial unemployment persisted among unskilled and semiskilled workers. Increases in wage rates were moderate and were offset in many branches of commodity production by improvements in techniques, equipment, and skills so that unit costs and supply prices were not changed appreciably. Many services, however, continued to have upward price movements.

Consumer Price Index and Retail Prices.—The Consumer Price Index, which shows average changes in retail prices of important goods and services purchased by city wage earners, indicated a slight rise in the cost of living in the United States in 1962. The index rose from 104.5 in December 1961 and January 1962 to 106.1 in September 1962 (the average of prices in 1957–59 being used as the base of 100). The cost of living in September 1962, an all-time high, exceeded by 1.5% the index of such costs in December and September 1961.

Average prices of services, having a weight of about one third in the general index, in September 1962 were 1.8% higher than a year earlier, while average retail prices of commodities were 1.3% higher, and prices of commodities with food excluded were 0.8% higher. Average retail food prices, having a weight of slightly less than one third in the general index, in September 1962 were 2.1% higher than a year previously. Higher prices for meats and cereal and bakery products accounted for nearly all of the increase. Prices of fruits and vegetables and dairy products were slightly lower. Egg prices were at the lowest level in 21 years. Prices of housing items were 0.9% higher than in September 1961, largely because of higher rents. Average retail apparel prices declined early in the year, increased irregularly later, and in September 1962 were 1.0% higher than a year earlier. Prices of transportation rose irregularly and were 1.7% higher than in September 1961; prices of medical care were 2.5% higher; personal care, 1.9% higher; reading and recreation, 1.9% higher; and miscellaneous items, 0.6% higher.

Consumer Price Indexes for Ten Large Cities.—Prices of items included in the cost-of-living index are collected in 46 cities which are representative of urban areas in the United States. Comparison of city indexes shows that prices in one place may have changed more or less than in another. They do not measure differences in the cost of living between cities. Among the ten cities represented in the table, the greatest increase in the cost of living between 1957–59 and August 1962 occurred in Seattle (6.7%); the smallest increase, in Detroit (2.3%). During this period the national Consumer Price Index increased 5.5%. From August 1961 to August 1962, the greatest increase in the cost of living occurred in Houston (2.0%), and the smallest increase in Cleveland (0.2%). During this one-year period, the national Consumer Price Index increased 1.2%.

CONSUMER PRICE INDEX FOR TEN LARGE CITIES, AUGUST 1962 AND 1961 (1957–59 = 100)

City	August 1962	August 1961	Percent change, 1961 to 1962
Chicago	104.4	103.7	0.7
Cleveland	103.8	103.6	0.2
Detroit	102.3	102.0	0.3
Houston	104.6	102.5	2.0
Los Angeles	106.6	105.1	1.4
New York	106.6	104.9	1.6
Philadelphia	105.2	104.2	1.0
Scranton	106.0	104.2	1.7
Seattle	106.7	104.9	1.7
Washington, D.C.	104.6	104.0	0.6

(Source: U.S. Department of Labor, Bureau of Labor Statistics)

Wholesale Commodity Prices.—The monthly wholesale price index of the U.S. Bureau of Labor Statistics showed a fractional increase of 0.8% in the first three quarters of 1962. This slight increase was in contrast to a fractional decrease in the same period of 1961. The index rose to 100.8 (1957–

59 = 100) in January 1962, declined to 100 in June, and then rose to 101.2 in September—0.2% above the previous high in the first quarter of 1961.

The increase in the early part of 1962 was the result of higher prices for all the principal commodity areas—farm products, processed foods, and industrial commodities. Prices of farm products showed the largest percentage increase as freeze damage in several producing areas raised prices of a number of fresh vegetables. Partly because of adverse weather conditions, prices of livestock, live poultry, and eggs also advanced sharply. Higher prices for meats, processed poultry, and raw sugar accounted for the increase in the average for processed foods. The rapid expansion of business activity early in the year was largely responsible for the higher average of industrial commodity prices (such as those of steel scrap, fuels, chemicals, and paper products).

The subsequent decline of the index to 100 in June 1962 was primarily the result of falling prices for farm products in the second quarter—the first drop in the average of such prices since October 1961. Lower prices for fresh vegetables and fruits, livestock, live poultry, fluid milk, eggs, and grains were mainly responsible for the drop in the average. Lower prices for meats, processed poultry, and dairy products were largely responsible for the decrease in the average for processed foods. The average of industrial commodity prices declined irregularly and only fractionally—the main items with lower prices being metal scrap (the lowest prices for iron and steel scrap in 12 years), fuel, chemicals, and wood pulp and some paper products.

The rise of the wholesale price index in the third quarter of 1962 more than offset the decline in the first half of the year. Nearly all of the rise in the index was accounted for by higher prices of farm products and processed foods. The index of 101.2 in September 1962 represented an increase of 1.2% as compared with September 1961. This increase resulted from prices for farm products 5.7% higher than in September 1961, and for processed foods, 3% higher. Prices of industrial commodities were 0.1% higher than a year earlier. In the farm group, appreciably higher prices prevailed for livestock and live poultry, fruits and vegetables, and eggs. In the group of processed foods, appreciably higher prices prevailed for meat, poultry, and fish, cereal and bakery products, sugar and confectionery, and animal fats and oils.

In the industrial group, appreciably higher prices prevailed in September 1962, as compared with September 1961, for textiles and apparel, fuels and related products, lumber and wood products, pulp and paper products, and miscellaneous products. These price increases were roughly offset in the industrial index by appreciably lower prices for chemicals and allied products, rubber and rubber products, and metals and metal products.

Canada.—The cost of living in Canada increased only slightly in 1962. During the first three quarters of the year the index of consumer prices rose 1%, and in September 1962 the index of 131 (1949 = 100) was 1.5% higher than a year earlier. Food prices fluctuated but moved generally upward, and in September were 2% higher than in December 1961 and 3% higher than a year earlier. In the same nine-month period, prices of housing (shelter and household operation) increased 1%, and in September were 1.3% higher than in September 1961. The changes in these two components of the index were important since they have weights of 27 and 32, respectively, as compared with a total of 41 for the other five components. Clothing prices declined early in the year and then increased irregularly to a level in September fractionally lower than in December 1961 and fractionally higher than in September 1961. Practically identical changes to those for clothing occurred in the prices for transportation. Prices involving health and personal care in September 1962 were fractionally higher than in December and 2% higher than a year earlier. Prices for recreation and reading, and for tobacco and alcoholic beverages were only slightly higher for both the nine- and twelve-month periods.

Wholesale prices showed greater change than the consumer price index. They rose steadily during the first three quarters to a level in September 1962 about 2.2% higher than in December 1961, and 2.8% higher than a year earlier. Higher prices for farm products—5.9% higher than a year earlier—accounted for most of the increase in the general index. Livestock prices showed a substantial advance of 13%, and prices of fresh meat a slightly higher advance of 16%. Industrial commodity prices also contributed to the rise in the general index. Slightly higher prices prevailed in September 1962 for fibers and textiles, wood and paper products, nonferrous metals, and nonmetallic minerals.

CLIFFORD L. JAMES,
Professor of Economics,
The Ohio State University.

COSTA RICA

Located between Nicaragua and Panama in Central America, the Republic of Costa Rica has an area of 19,653 square miles, and a population of 1,225,000 (1961 est.). Principal cities and populations (Jan. 1, 1960 est.): San José, the capital, 107,956; Puntarenas, 18,299; Alajuela, 17,901; Cartago, 17,544; Heredia, 17,334; and Limón, 15,703. The population explosion in Costa Rica continues to place the country among the world leaders in population growth, with a birth rate of about 6% in 1961. Spanish is the official language.

Government.—Costa Rica is a constitutional republic. The president, who is popularly elected for a 4-year term, is Francisco José Orlich Bolmarcich (inaugurated May 8, 1962, succeeding Mario Echandi Jiménez). The unicameral Legislative Assembly consists of 57 members popularly elected by secret, direct, and free ballot for 4-year terms. Number of seats held in the Legislative Assembly (following elections of Feb. 4, 1962): National Liberation Party, 29; National Republican Party, 18; National Union Party, 9; Democratic Popular Action, 1.

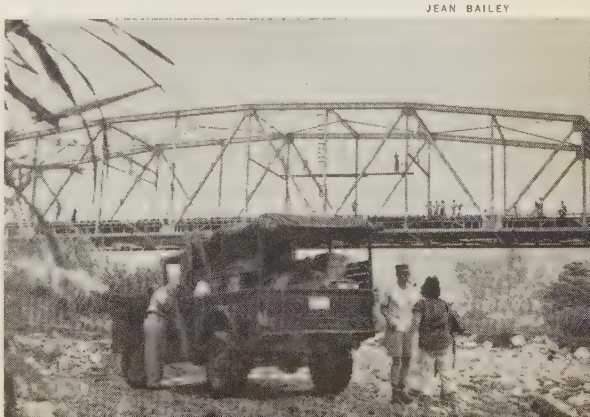
Education and Religion.—School enrollment, 1961: 230,906, about 51% of the school-age population. Number of schools (with enrollments), 1961: 1,561 primary (193,679); 62 secondary (27,491); 23 technical (5,935); 1 higher (3,801). The Inter-American Institute of Agricultural Sciences is located in Turrialba. It has been estimated that nearly 79% of the population is literate. Principal religion: Roman Catholicism, supported by the state. There is religious liberty under the constitution.

Finance.—Government revenue, 1961 est.: 345,751,000 colones (350,972,000 in 1960); expenditure, 345,751,000 (356,735,000 in 1960). Since Sept. 3, 1961, 6.62 colones equal U.S.$1. National debt: 461,111,833 colones on Dec. 31, 1960 (457,178,499 in 1959). Gold and foreign exchange holdings: $9.7 million as of Dec. 31, 1961 ($14.4 million in 1960).

Transportation and Communications.—Transport networks (miles): private and state-owned railways, 701 (1958–59); main roads, 497 paved (1960–61). National airlines: Líneas Aéreas Costarricenses (LACSA) and 8 smaller domestic lines. Costa Rica is also served by 5 foreign airlines; El Coco, near San José, is the principal airport. Other communications data: motor vehicles, 25,107 (1961); telephones, 15,933 (1960); radio receivers, 75,000 (1960); television was introduced in May 1960.

Under construction in a remote area of Costa Rica, bridge is part of new work completed on the Pan American Highway.

JEAN BAILEY



Economic Indicators.—Gross national product: 2,695 million colones in 1960 (up 6.1% from 1959). Cost-of-living index (1958 = 100): 106 in midyear 1962; 103 in 1961. Number of unemployed workers: 60,000 in March 1962 (about 14.5% of the total labor force of 412,406 persons).

Manufactures and Minerals.—Although a Ministry of Industry was formed in 1961, Costa Rican industry is still light and on a small scale. Chief products, 1960 est.: lumber, 253,000 cubic meters; wood pulp, 2,000 metric tons (1959); cigarettes, 1,101 million (1959); beer, 88,700 hectoliters; electric power, 383 million kw.-hr. Mineral production is negligible.

Agriculture.—Agriculture accounts for about 40% of the national income and 90% of the exports, and engages some 55% of the labor force. Chief crops (tons, 1961): sugar, 90,000 (74,000 in 1960); cocoa, 12,000 (12,450); tobacco, 891 (828), dried beans, 21,100 (15,700); rice, 58,000 metric tons (57,000); green coffee, 1,140,000 bags of 132.276 pounds each (1,165,000); bananas, 12,898,000 stems exported (9,946,000).

Foreign Trade.—Total exports, 1961: $81.8 million (down from $89 million in 1960); imports, $107.1 million (down from $110.4 million in 1960). Principal exports (in millions of United States dollars, 1961): coffee (green), $43.3; bananas, $20.4; cocoa beans, $4.3; beef, $2.8. Principal imports: manufactures, machinery and transport equipment, food, beverages, and tobacco, chemicals, mineral fuels. Chief customers, 1961: United States (57.6%); West Germany (20.9%); Netherlands (4.3%); Belgium-Luxembourg (2.3%). Principal suppliers, 1961: United States (46.7%); West Germany (10.9%); Great Britain (5.5%); Netherlands (3.04%).

Events, 1962.—The 1962–63 coffee crop was estimated at 1.240 million bags, an increase of about 8% over the previous year. The increase in production in this vital cash crop was matched, however, by low coffee prices, continuing unemployment, weakness in national currency, a continuing budgetary deficit, and the prospect of Costa Rica's failing to maintain her share of Central American trade because she had not yet joined the projected Central American Common Market. In 1961, imports exceeded exports for the seventh straight year with both exports and imports falling off from 1960 levels, thereby adding to the problems faced in 1962.

In January 1962 the United States announced its intention to offer up to $12 million to Central American and Mexican coffee growers to hold part of their export quotas off the market. The nature of the banana economy was altered through the United Fruit Company's sale of about 10% of its Costa Rican land holdings to "associate producers" who signed contracts up to five years in length to supply the company exclusively.

In the industrial sector, aid from the Alliance for Progress had reached $17,899,000 by March 1962. In August the Inter-American Development Bank (IDB) announced two loans totaling $5.7 million for electrical power and loans for expansion of light industry in construction materials, lumber processing, the manufacture of insecticides and fertilizers, pharmaceuticals, chemicals, foodstuffs, textiles, and electrical equipment. Earlier in the year the IDB lent $2.7 million to develop Costa Rica's first cement plant, scheduled for 1964. The stress on industrial development was also reflected in the near completion of an $18.5 million hydroelectric plant on the Río Macho to add (by 1963) 30,000 kilowatts, expanding the national generating capacity by 40%. A similar step was taken in the construction of a modern slaughterhouse at Montecillos.

Costa Rica's new president inherited a reported budget deficit of 180 million colones (about $27.3 million). The new administration sought to strengthen the currency by various economy measures and by announcing in June its intention to repay $4.9 million in defaulted government bonds; interest payments had been suspended since October 1961. Finally, it was interpreted that these many economic pressures led Costa Rica in July to sign the General Treaty of Central American Economic Integration, adopted in December 1960 at Managua, Nicaragua. This act brought all five Central American states into a unified effort to establish regional external tariffs and remove up to 95% of internal trade barriers, a most significant event for the regional common market movement.

Politically, the country witnessed a relatively peaceful presidential campaign in which Francisco José Orlich Bolmarcich led the National Liberation Party to victory over Rafael Calderón Guardia (National Republican), Otilio Ulate Blanco (National Union), and Enrique Obregón (Democratic Popular Action). Only one pro-Castro, pro-Communist candidate succeeded in gaining a seat in the Legislative Assembly; the Communist Party was denied registration for the election.

In 1962, Costa Rica continued to oppose Cuban activities in the Western Hemisphere, had no ties with Cuba, and continued to align itself with the Alliance for Progress program. However, reform measures were slow in land legislation, tax reform, and in developing a 10-year national development plan. A U.S. Peace Corps group of teachers of English, and trained personnel in physics, mathematics, chemistry, and biology was scheduled to go to Costa Rica by the year's end.

Associate Professor of History,
University of the Pacific.

COTTON

United States production of cotton in 1962 was 14,723,000 bales (500 pounds gross weight each), according to the Statistical Reporting Service of the U.S. Department of Agriculture. This was 405,000 bales more than in 1961 and 744,000 more than the 1951–60 average. Growers planted 16,296,000 acres in cotton in 1962, of which 15,521,000 were harvested. Both planted and harvested acreages were a little below 1961 and well below the 10-year average. Yield of lint per acre averaged 455 pounds in 1962, 17 pounds more than in 1961 and 75 pounds more than the average. California had the highest yield among the states, with a record 1,092 pounds per acre. The United States crop included 99,000 bales of American-Egyptian cotton, 36,400 bales more than a year earlier (mainly because of a 58% increase in the acreage allotment).

The carry-over of cotton into the 1962–63 marketing year totaled 7,850,000 bales, 622,000 more than a year earlier. With both production and stocks increasing, the total supply of cotton for 1962–63, including imports, was estimated at 22,773,000 bales. This was slightly above the 1961–62 supply and close to the level of recent years.

U.S. COTTON PRODUCTION IN LEADING STATES
(In thousands of bales)

State	Average, 1951–60	1961	1962
North Carolina	368	278	275
South Carolina	528	412	450
Georgia	608	512	535
Tennessee	567	554	560
Alabama	773	617	695
Mississippi	1,600	1,625	1,700
Missouri	389	377	465
Arkansas	1,339	1,456	1,450
Louisiana	570	479	545
Oklahoma	360	369	330
Texas	4,050	4,786	4,680
New Mexico	296	300	275
Arizona	835	828	885
California	1,650	1,689	1,840
Other states	47	36	38
United States	13,979	14,318	14,723

Production in 500-pound gross weight bales which contain about 480 pounds of lint. (Source: Statistical Reporting Service, U.S. Department of Agriculture.)

World cotton production continued to rise in 1962–63, setting a new record for the fifth consecutive season, according to the Foreign Agricultural Service of the U.S. Department of Agriculture. Production outside the United States amounted to 34,625,000 bales, compared with 32,922,000 bales in 1961–62 and the 1955–59 average of 30,653,000 bales. Both world acreage and yields were higher than in the preceding season.

COTTON PRODUCTION BY LEADING COUNTRIES (EXCLUDING THE UNITED STATES)

(In thousands of bales)

Country	Average, 1955–59	1961	1962*
China (Mainland)	7,160	6,700	7,000
USSR (Europe and Asia)	6,750	7,000	6,900
India	3,991	4,050	4,200
Brazil	1,490	2,475	2,600
Egypt (U.A.R.)	1,807	1,542	2,214
Mexico	2,032	1,995	2,050
Pakistan	1,367	1,450	1,475
Turkey	738	950	975
Sudan	500	930	750
Syria	441	572	690
Peru	518	600	600
Spain	209	485	490
Iran	306	485	460
Colombia	154	350	430
Greece	270	448	430

* Preliminary. Years shown refer to crop years beginning August 1 in which major portion of the crop is harvested. Production is in bales of 480 pounds net. (Source: Foreign Agricultural Service, U.S. Department of Agriculture.)

Most of the increase in production in 1962–63 came in free world countries, which had an output of 20,644,000 bales, 1.5 million bales more than in 1961–62 and 4 million bales more than the 5-year average. Increases were widespread, although Egypt accounted for nearly half. Output in Communist countries totaled 13,981,000 bales in 1962–63, compared with 13,773,000 bales in the preceding year and the 5-year average of 14,024,000 bales.

The 1962–63 increase in production came at a time when world consumption was slowing down. It appeared that production would exceed consumption for the first time since 1955–56, reversing the downtrend in stocks of the preceding six years.

CRIME

Trends in the incidence of crime, and in juvenile delinquency and crime prevention, are reviewed below under two headings: (1) U.S. Crime Statistics; and (2) Delinquency and Crime Prevention. For additional information, see also CHILDREN AND YOUTH; FEDERAL BUREAU OF INVESTIGATION; LAW; NARCOTICS; POLICE; PRISONS; SOCIOLOGY.

U.S. Crime Statistics

Crime in the United States for the first nine months of 1962 showed a 5% increase over the same period in 1961, according to the *Uniform Crime Reports* figures compiled by the Federal Bureau of Investigation (q.v.). Nearly all types of property crimes (involving all types of theft, through force or stealth) showed an increase over 1961. These crimes make up a large portion of the Crime Index and to a great extent control the total trend. Crimes against the person also recorded an increase. Serious assault was up 4%, forcible rape up 2%, and murder up 1%. In cities with over 25,000 population, murder was up 5%.

An analysis of robbery, burglary, and larceny by type for the first nine months of 1961 and 1962 shows that street robberies were up 2%, whereas residence robberies jumped 13%, bank robberies 21%, and chain store robberies 5%. Burglaries of residences during the daytime recorded a 5% increase. In the larceny category, shoplifting was up 21%, and pickpocket activity was up 2%.

Crime Trends, 1961.—The national population has increased 7% during the past five years while crime (based on the Crime Index) has gone up 34%. The estimated 1,926,090 serious crimes reported in the calendar year 1961 reflect a 3% increase over the number of crimes recorded the previous year.

Crimes against property showed the greatest increase, with an upsurge of 4% as a group. Crimes against the person, reported by 7,800 law enforcement agencies across the country, showed an increase of 1% as a group. The upward trend in the number of crimes reported continued at a faster pace in the smaller cities under 25,000, metropolitan fringe counties, and rural areas, with increases of 6 to 8%.

The number of crimes committed in the various individual categories showed the following percentage changes from 1960: murder, down 4%; forcible rape, unchanged; robbery, down 1%; aggravated assault, up 2%; auto theft, up 2%; burglary and larceny of $50 and over, up 4%.

The 1961 crime rate was 10% above the average for the past three years. The 4% decrease in murders committed in 1961 as compared with 1960 reflects a leveling off to the average for the period 1958 through 1960. Although robbery in 1961 was down 1% as compared with the peak reached in 1960, it was still 13% above the 1958–1960 average.

Crime index figures indicate that four serious crimes occurred each minute of 1961. Also in 1961, one murder occurred each hour, a forcible rape every 33 minutes, an aggravated assault every 4 minutes, a robbery every 6 minutes, a burglary every 37 seconds, a larceny ($50 or over) each minute, and an auto theft every minute and a half.

Persons Arrested.—The following data concerning the age, sex, and race of persons arrested are from annual reports prepared by city police. The figures include persons arrested and later released, as well as those held for prosecution under formal charges. The figures for age and sex are for arrests during the year 1961 in 2,776 cities, covering a total population of 85,158,360.

Sex.—Of the 3,851,825 persons arrested in 2,776 reporting cities during 1961, 433,962 were females and 3,417,863 were males.

Age.—Of the 3,851,825 persons arrested in 2,776 cities during 1961, 566,682 (or 14.7%) were under the age of 18. Of those persons under 18 arrested in 1961, 238,038 (42%) were not yet 15 years of age.

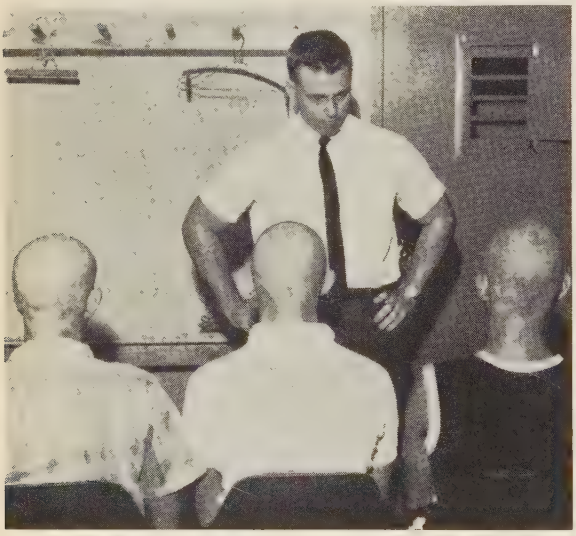
As a group, persons under 18 years of age represented 43% of all arrests for the more serious offenses of murder, forcible rape, robbery, aggravated assault, burglary, larceny, and auto theft. Young people were involved in 59% of the auto theft arrests, 47% of the burglaries, 48% of the larcenies, 22% of the robberies, 17% of the forcible rapes, 12% of the aggravated assaults, and 8% of the murders.

Persons under 25 accounted for 1,270,088 of the total arrests in 2,776 reporting cities. Of all arrests in 1961, 10.3% involved persons who were 25 to 29 years of age. The age group 30 to 34 ac-

counted for 10.7% of the arrests; the age group 35 to 39, for 11.2%; the age group 40 to 44, for 10.0%; and the age group 45 to 49, for 8.5%. Persons 50 or older accounted for 16.0% of arrests, and the age of persons involved in 2,667 arrests was not known.

Race.—Based on reports of 2,759 cities, covering a total population of 75,553,307, 96.9% of the total 3,608,317 arrests were members of the white and Negro races. Arrests of members of the white race totaled 2,424,631, or 67.2% of all arrests in reporting cities, and 1,073,491 arrests, or 29.8%, were members of the Negro race. The remaining arrests, totaling 110,195, were of 79,716 Indians, 3,428 Japanese, 1,725 Chinese, and 25,326 others.

Police Employee Data.—A total of 71 law enforcement officers were killed in 1961. In the same period there were 13,190 assaults against police officers. Eight of every 100 police officers employed were victims of assault at the hands of persons with whom they came in contact. Despite the increased total of serious crimes, the number of police employees per 1,000 inhabitants remained unchanged from 1960.



WIDE WORLD

Montgomery, Ala., court official examines three young car thieves shorn of fancy hairdos by judge's order, July 14.

J. EDGAR HOOVER,
Director, Federal Bureau of Investigation.

DELINQUENCY AND CRIME PREVENTION

Juvenile delinquency and adult crime are worldwide problems which have increased in extent and intensity during recent years. Increased awareness of the problems has stimulated efforts to deal with offenders and to prevent the spread of criminal activities.

In the United States, the delinquency rate has increased more than twice as fast since 1950 as the juvenile population, which has increased sharply. School dropouts and youth unemployment are related problems. Schools are expanding orientation courses, revamping curricula, and endeavoring in other ways to meet the situation, and public campaigns are being conducted to keep young people in school and to induce dropouts to return. Efforts are being made to provide suitable employment for those who need work. The problems of minority groups and substandard living areas are being given increased attention.

Federal Programs.—The Juvenile Delinquency and Youth Offenses Control Act (1961) authorized appropriations of $30 million for a three-year period, to be administered by the secretary of health, education, and welfare in consultation with the attorney general and the secretary of labor. These officials constitute the President's Committee on Juvenile Delinquency and Youth Crime, appointed earlier in the year. In 1962 a Citizens Advisory Council was added. A number of appropriations have been made, chiefly grants to cities for demonstration projects and grants to universities and several other institutions for technical training programs for personnel serving juveniles, short-term training institutes, and curriculum development.

The largest grant ($1.9 million) was made to the City of New York and Mobilization for Youth, Inc., for a major demonstration project for New York City's Lower East Side. The Mobilization for Youth also received grants from other sources. Education and work are basic aspects of the program, emphasizing the roles played by school failures, school dropouts, and youth employment in delinquency causation. The establishment of the Youth Development Unit in the U.S. Children's Bureau provides technical assistance to states and communities in implementing the Juvenile Delinquency and Youth Offenses Act.

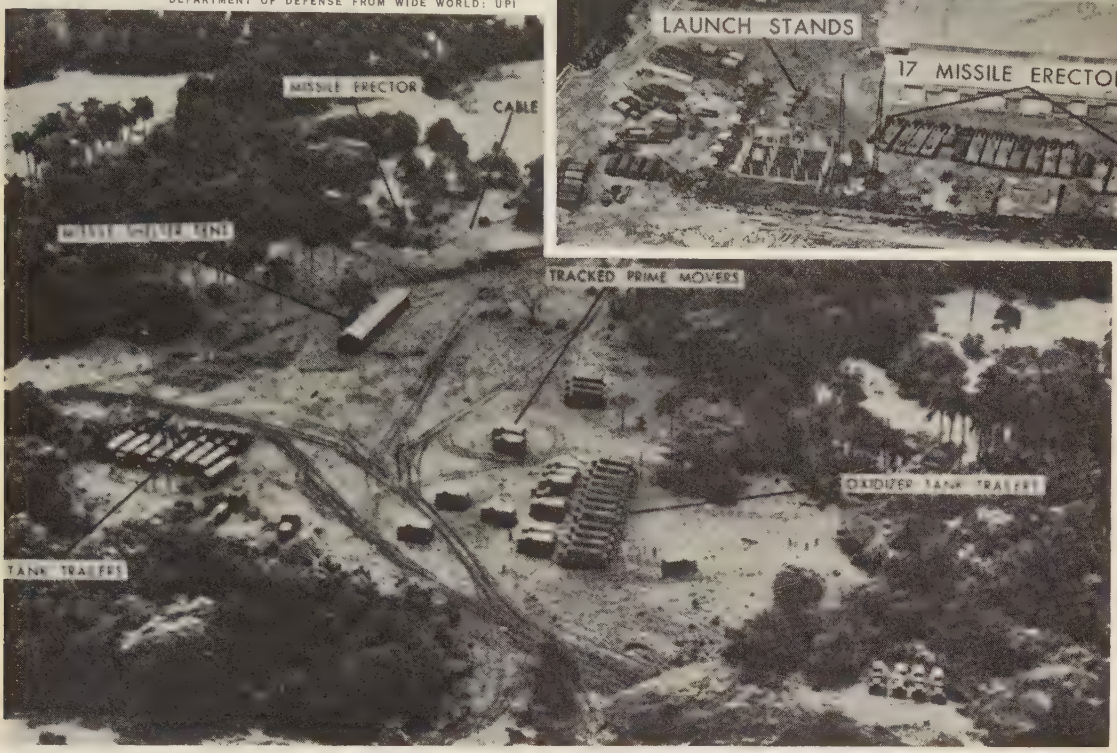
State Programs.—The National Governors' Conference on Delinquency and Youth Crime was held in Denver, Colo., Oct. 20–21, 1961. The four major areas of concern were: (1) school dropout and youth unemployment; (2) training of professional personnel working with youth; (3) development of means for collecting and disseminating information about delinquency and ways to combat it; and (4) public education programs dealing with the treatment and prevention of criminal behavior. *Juvenile Delinquency: a Report on State Action and Responsibilities* (1962), published by The Council of State Governments, describes the state governmental systems designed to combat juvenile delinquency and youth crime, and makes recommendations for improvement.

Private Organizations.—The National Council on Crime and Delinquency (NCCD), formerly the National Probation and Parole Association, has continued to expand its program of treatment, control, and prevention of crime and delinquency. The two main developments are the continued extension of the Citizen Action Program and the staffing and organization of the Research and Information Center on Crime and Delinquency. Funds for sponsoring the action program were provided by the Ford Foundation, and the research and information center activities have been supported by the Rockefeller Brothers' Fund and the National Institute of Mental Health. By midyear 1962, 16 states had organized citizen committees composed of representatives from business, industry, labor, agriculture, and the professions. Their major objectives are to strengthen facilities and services which deal with offenders and to promote more effective preventive programs.

The Research and Information Center published its first report in 1962 on *Current Projects in Prevention, Control, and Treatment of Crime and Delinquency*, listing over 500 research and demonstration projects, of which 385 are analyzed as to sponsorship, general purpose, theoretical orientation, characteristics of the groups studied, analysis of causative factors, treatment targets, and policies and practices. While governmental organizations, universities, and private agencies sponsor and support most of the research projects, slightly more than half of the projects are undertaken under the auspices of two or more agencies. NCCD

Defense Department photograph (*below*) taken on October 23, at the height of the Cuban crisis, shows missile site under construction near San Cristobal. Picture taken on November 4 at Mariel Naval Port (*right*) shows missile erectors and launching stands, ready to be loaded aboard vessels.

DEPARTMENT OF DEFENSE FROM WIDE WORLD; UPI



started publishing bimonthly bibliographies of material on crime and delinquency in over 500 journals and other publications.

International Organizations.—World concern about criminal activities is evidenced by the increase in organizations and publications. The International Society of Criminology lists over 60 affiliated societies and institutions concerned with crime and delinquency. The Research and Publications Section of the UN Bureau of Social Affairs compiled a list of publications by the United Nations and specialized agencies during the past 10 years, and the annotated bibliographical references listed in the publication *International Review of Criminal Policy* run into thousands.

Meetings.—The 9th National Institute in Crime and Delinquency was held July 22–25, 1962, in Seattle, Wash. In addition to general meetings, 45 workshops were held on a variety of subjects, including delinquency prevention, law enforcement, juvenile and adult probation and parole, research, education and training, citizen action, and special problems of delinquents. The International Criminal Police Organization held its 31st General Assembly in Madrid, Sept. 19–26, 1962. The International Association of Youth Magistrates met in Naples, Sept. 26–29, 1962. The 69th annual conference of the International Association of Chiefs of Police convened in St. Louis, Mo., Oct. 6–11, 1962. The European seminar on "The Evaluation of Methods Used in the Prevention of Juvenile Delinquency," which convened in Rome, Oct. 14–24, 1962, was organized by the United Nations within the framework of the European Social Welfare Programme. The American Society of Criminology met jointly with the American Association for the Advancement of Science in Philadelphia, Dec. 26–31, 1962.

Bibliography.—Among the recent publications on crime and delinquency were: Bloch, Herbert A., and Geis, Gilbert, *Man, Crime, and Society* (New York 1962); Cavan, Ruth S., *Juvenile Delinquency* (Philadelphia 1962); Scott, Sir Harold, ed., *The Concise Encyclopedia of Crime and Criminals* (New York 1961); Wolfgang, M. E., Savitz, L., and Johnston, N., *The Sociology of Crime and Delinquency* and *The Sociology of Punishment and Corrections* (New York 1962).

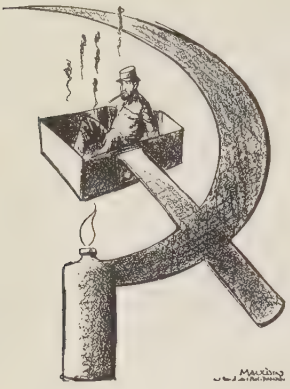
CUBA

With an area of 44,218 square miles and a population (mid-1961 est.) of 6,933,000 (1953 census, 5,829,029), Cuba is strategically and commercially the most important of the West Indian republics. The capital, Havana, has a population (1959 est.) of 1,249,000. Other large cities, with urban populations (est. 1959), are: Santiago de Cuba, 190,000; Camagüey, 128,000; Santa Clara, 91,000; Guantánamo, 77,000; Matanzas, 71,000; and Holguín, 70,000.

Government.—Since the 26th of July Movement, headed by Dr. Fidel Castro Ruz, seized power by force on Jan. 1, 1959, Cuba has become a Communist-style dictatorship. The government is directed and controlled by the Integrated Revolutionary Organizations (ORI), headed by a National Directorate of 25 members (including 10 Communists) that was announced on March 9, 1962.

Premier Castro announced on July 26, 1961, that all military, political, labor, and other organizations would be merged into a single, all-powerful party. Preparations for the creation of the United Socialist Revolutionary Party (PURS) were carried out in 1962, and in a speech on September 28, Castro declared that the new party would



"Chafing Dish"

MAULDIN IN THE ST. LOUIS POST-DISPATCH

be launched formally in 1963. The first step in recruiting party members was to identify Communist activists and organize them as member-candidates in cells. Such persons were required to be so-called "vanguard" workers who possessed high moral virtues and revolutionary awareness; they received identification cards countersigned by Castro, and were placed on probation for one year. By September 1962, party meetings held in some 4,000 factories and mines had been attended by more than 350,000 persons, and more than 26,000 model workers were admitted to probationary status.

In an important political address on March 26, 1962, Castro made clear that he would not permit the old-line professional Communists to assume all positions of power in Cuba. He dismissed Aníbal Escalante from the National Directorate and reasserted the authority of his revolutionary comrades who had served in the 26th of July Movement. He named his brother, Raúl Castro, as vice premier.

Education.—Cuba's record in providing public primary and secondary education was for many years among the most distinguished in Latin America. Nevertheless, when Castro seized power in 1959, about 22% of the population above 15 years of age was illiterate; the average length of primary school enrollment was 4–5 years; and rural schools were usually inferior to urban ones. In a speech of Sept. 11, 1962, Premier Castro claimed the following achievements in education under his revolution: "the number of students matriculated in primary schools rose from 650,000 to 1.2 million; the number of classrooms, from 15,000 to nearly 30,000; illiteracy was virtually erased, and hundreds of thousands of adults learned to read and write; the number of secondary students rose from 120,000 to 250,000; the number of first grade students rose from 185,000 to 450,000." It was also claimed that 450,000 adults were enrolled in adult educational schools, nearly 100,000 in worker-improvement schools, and 50,000 in night schools. Castro further declared: "We Cubans can say with pride that in the field of education we are leading America, with no exceptions." Independent observers discredited the educational claims of the Castro regime and contended instead that very little was being accomplished at any level.

In order to indoctrinate as many Cubans as possible in Marxism-Leninism, a nationwide network of "revolutionary instruction schools" was created, and plans were made to graduate 30,000 students in 1962. Juan Marinello, a Communist leader who serves as the president of Havana University (estimated enrollment, 12,000), announced on June 14, 1962, the creation of a "workers' college," which is to enroll no less than 5,000 students.

Finance.—The government announced a budget for 1962 of about 1.8 billion pesos, including 700 million for economic investment; 228 million for "basic community services"; 208.3 for industry; 111.7 million for agriculture, forestry, livestock, and fishing; and 551.1 million for social services, including education, science, and culture. The Cuban peso has an official par value equal to the U.S. dollar, but at the free rate of exchange in 1962 the peso equaled about 5 U.S. cents.

Foreign Trade.—Trade with the United States virtually ceased after President Kennedy's trade embargo effective Feb. 7, 1962, on all commodities excepting certain foods and medicines. Cuba purchased only $95,000 worth of foodstuffs from the United States in the second half of 1961, as compared with $9,500,000 in the first half of the year. Only 3,000 taxable cigars were imported by the United States in the first half of 1962, as compared with 4,200,000 cigars in the same period of 1961 and with 9,200,000 in the first half of 1960.

According to Soviet trade figures, Cuba in 1961 bought civilian goods from the Soviet Union worth 248,000,000 rubles ($275,280,000), and sold sugar and some fibers to the Soviet Union worth 281,000,000 rubles ($311,091,000). The favorable trade balance equivalent to $36,063,000 could have been used to pay for military goods, salaries for Soviet technicians, and the expenses of 1,500 Cuban students and 1,000 Cuban farmers being trained in the Soviet Union. From July to October 1962, the Soviet bloc poured equipment and supplies into Cuba at an average rate of more than a shipload per day, and in late October, Soviet aid was estimated at more than $1 million per day above what the Soviet Union received from Cuba.

Industrial Developments.—Carlos Rafael Rodríguez, head of the National Institute of Agrarian Reform and the leading Communist theoretician in Cuba, declared that a socialist economic system had been achieved by 1962. He asserted that 80% of industrial output was produced in plants owned by the state, and that the same percentage of agricultural production was accounted for by enterprises under the close control of the socialist sector. Rodríguez projected an annual economic growth of 12% which would result by 1967 in a gross national product double that of 1962 and triple that of 1958.

Ernesto ("Ché") Guevara, minister of industry, stated in May 1962 that the iron and steel, nickel, electric power, automobile, shipbuilding, and cement industries were being developed with the assistance of the Soviet Union and other Soviet-bloc countries. Under the first four-year plan (1962–65), the ratio of industrial investment to agricultural investment was placed at 60 to 40, respectively. In 1962, the ratio of light to heavy industry was described at 55 to 45, but in the next nine years heavy industry was to be favored by an 80 to 20 ratio. Specific achievement claimed for 1962 included progress in constructing 1,000 canecutting machines, an increase in steel production, production of nickel sulphide for shipment to Soviet-bloc countries, and the near completion of the Hanabanilla hydroelectric power project, which is to supply 80 to 85 million kw.-hr. for the Cienfuegos area. Cuba signed an agreement with the Soviet Union on Sept. 25, 1962, for the construction of a port to include piers for unloading fish, re-

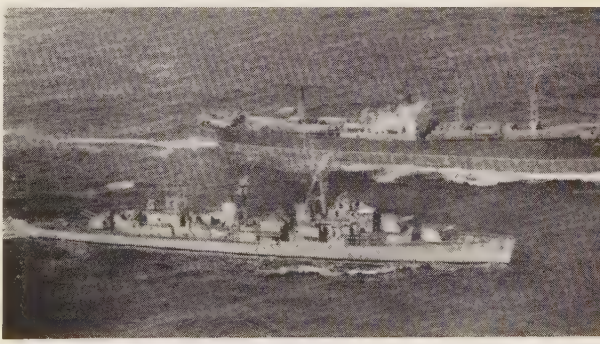
frigerated warehouses, ship repair shops, and industries to process and preserve fish. The entire project was to cost about $12 million.

Economic Conditions.—Official statements from the Cuban government in 1962 indicated that many economic problems had been encountered. Castro admitted that shoes produced were lasting only two months on an average. About 30% of the families receiving governmental housing were defaulting on their payments. Government officials used the term *gusanos* (worms) to describe persons accused of committing industrial sabotage. A new word—*sentismo*—was coined to describe labor featherbedding and work slowdowns. To overcome these and other difficulties, the ORI and the Central Planning Board instituted a campaign of "brotherly production competition" and "socialist emulation," under which various rewards were established for efficient workers. Some rewards were symbolic and included honorable mention, prizes, and diplomas; others were material and included increases in monthly wages up to 75% for "vanguard" workers, as well as paid vacations. In addition, a decree of August 29 provided for tight controls on wages, stiff penalties for absenteeism, and a sharp curtailment of vacation time; the measures were designed to increase productivity. The decree also authorized the transfer of workers from one job to another without their consent. Many instances were cited during 1962 of court actions taken against people for violating economic regulations.

By January 1962 all essential foods were rationed, and full-scale rationing was initiated on



(*Below*) Crates on deck of Soviet freighter are Il-28 bombers, leaving Cuba early in December. (*Upper right*) U.S.S. *Vezole* (foreground) steams beside Soviet ship thought to be carrying missiles from Cuba on November 10. (*Lower right*) Three more Il-28's leave Cuba on Soviet ship, December 1.

UPI UPI WIDE WORLD

March 19. Neighborhood Committees for Defense of the Revolution, made up of party activists, controlled the ration coupon books. The Communist press of Cuba admitted in January 1962 that food costs had risen by 150–200%. Food consumption from 1959 to 1962 declined by about 25%, and many foods, including ham, black beans, corn, lettuce, cabbage, garlic, turkey, pork, fish, and lobster, were almost nonexistent.

Agricultural Developments.—There was much evidence that the government's efforts to diversify agriculture had failed. The most important policy change with respect to agriculture was enunciated by Castro in a speech on August 18. He condemned individual land tenure, praised the people's farms (state farms operated like factories), and criticized Cuba's 600 cooperatives as inimical to the development of a rural proletariat. He indicated that the cooperatives would be transformed into people's farms, and declared: "We will not resort to individualism which will foment selfishness, which foments differences among men. We will depend on collectivity."

Sugar Marketing Conditions.—Cuba's sugar commitments for 1962 were estimated at 6,500,000 metric tons, of which 4,860,000 metric tons were destined for the Soviet bloc. However, Cuba produced only 4,800,000 metric tons in 1962, as compared with 6,767,000 metric tons in 1961. Drought and the failure to plant and fertilize adequately, combined with the refusal of many farmers to work, caused the decline. Because Cuba had on hand 1,419,000 metric tons from 1961 sugar stocks, the country had available 6,219,000 metric tons for foreign and domestic requirements in 1962. The Soviet bloc released about 500,000 metric tons from its import quota so that Cuba could earn foreign exchange in the world market. The trade deficit with the Soviet bloc was estimated at $150 million in 1962. Cuban workers in 1962 received less than half the average pay rate which prevailed in pre-Castro years. Only about 20% of sugar sales to the Soviet bloc were paid for in convertible currency.

Events, 1962.—Cuban relations with the United States and the Latin American countries steadily deteriorated during 1962, while ties with the Soviet Union and the Soviet bloc grew stronger. The United States submitted a 12,000-word document to the Inter-American Peace Committee on Dec. 6, 1961 (made public Jan. 3, 1962) which charged that Cuba "represents a bridgehead of Sino-Soviet imperialism and a base for Communist agitation and subversion within the inner defense of the Western Hemisphere." Only seven Western Hemisphere countries maintained diplomatic relations with Cuba at the beginning of 1962, and Argentina broke relations in February. At a conference of American foreign ministers in Punta del Este, Uruguay (Jan. 22–31, 1962), 20 countries voted to declare that the Cuban system was "incompatible" with the political ideals of the hemisphere, and by a vote of 14–1 (Cuba), with 6 abstentions, the conference excluded Cuba from activities of the Organization of American States (OAS).

Cuba's chief delegate to the United Nations, Mario Garcia-Inchaustegui, on January 29 vehemently attacked the United States in the General Assembly, using such expressions as "despicable hypocrisy" and "lack of international morality" to describe United States policy. The General Assembly's Political Committee on February 15 rejected the Cuban charge that the United States was planning aggression against Cuba. Similar efforts by Cuba later in the year also failed. On February 27, the UN Security Council refused to discuss Cuba's expulsion from activities of the OAS. Cuba then tried without success to get a ruling from the International Court of Justice on the legality of its exclusion.

The Castro government on April 7 convicted of treason 1,179 prisoners who had been captured in the abortive Bahía de Cochinos (Bay of Pigs) invasion by Cuban rebels on April 17–19, 1961. The prisoners were sentenced to 30 years' imprisonment but were permitted to obtain freedom on payment of fines. Each of the three invasion leaders was fined $500,000; 221 prisoners were fined $100,000 each; and 995 others were fined either $50,000 or $25,000. Cuba on April 14 returned 60 sick prisoners to the United States in exchange for a promised indemnity of $2.5 million to be paid by a Cuban exile group. The remaining 1,113 prisoners were returned on December 23–24 in exchange for foods and medicines valued at $53 million.

Cuban exile groups in the United States launched small armed raids against the Castro regime. Rebel boats shelled an Havana suburb on August 24, causing light damage. It was announced in New York on October 10 that Cuban rebel commandos had raided the port of Isabela de Sagua, and had killed some 20 defenders. Castro blamed the attacks on the United States and "mercenary agents."

It was reported that 75 Cubans were executed by the government in September for having engaged in an assassination plot against Premier Castro. Other executions of so-called enemies of the state were carried out by the regime during the year.

Beginning in July, Soviet shipments of arms to Cuba accelerated sharply. By October 3, 85 Soviet ships had unloaded military equipment and personnel. There were 4,500 Soviet servicemen in Cuba, 15 surface-to-air missile sites (25-mile range) were under construction, and three (or perhaps four) missile sites of a different type (20–35-mile range) also were being built. Cuba had 60 older-type Soviet MIG-15 and -19 jet aircraft, and at least one advanced-type MIG-21 jet plane. The Soviets had also delivered 16 Komar guided-missile patrol boats capable of carrying two guided missiles with a range of 11 to 17 miles.

President Kennedy on September 4 issued a statement calling attention to the arms buildup in Cuba. On September 13, the president warned that the United States would move swiftly against Cuba to protect its own security, but he said that military action was neither required nor justified at the time. The Soviet Union warned on September 11 that any attack by the United States on Cuba or on Soviet ships bound for Cuba would mean war.

Secretary of State Rusk on September 5 informed 19 Latin American ambassadors of United States determination to prevent the export of communism from Cuba. Rusk announced on October 3 a decision of the administration to deny use of American ports to nations whose ships were delivering arms to Cuba. Merchant vessels made more than 1,000 calls at Cuban ports between Jan. 1 and Sept. 1, 1962; 275 calls were made by Soviet-bloc ships and 250 calls by vessels of non-Communist nations under charter to the Soviet bloc. Turkey, Panama, and Japan agreed to cooperate with the United States.

On Monday evening, October 22, President Kennedy addressed the people of the United States on the subject of Cuba. The president declared that evidence had become available which demonstrated that "a series of offensive missile sites is now in preparation" in Cuba with the purpose of providing "a nuclear strike capability against the

Western Hemisphere." He disclosed that the missile sites were for medium-range ballistic missiles, capable of carrying a nuclear warhead for a distance of more than 1,000 nautical miles, and for intermediate-range ballistic missiles, capable of traveling 2,000 miles. President Kennedy then declared: "To halt this offensive buildup, a strict quarantine on all offensive military equipment under shipment to Cuba is being initiated. All ships of any kind bound for Cuba, from whatever nation or port, will, if they are found to contain cargoes of offensive weapons, be turned back. This quarantine will be extended, if needed, to other types of cargo and carriers." The presidential order, "Interdiction of the Delivery of Offensive Weapons to Cuba," went into effect on October 24. The OAS on October 23 voted unanimously to support President Kennedy's action.

In addition to the quarantine, the United States mobilized sufficient forces to provide an air strike against the offensive weapons or to invade Cuba. The confrontation produced great international tension and fears of a nuclear exchange between the Soviet Union and the United States, but Premier Khrushchev on October 28 acceded to President Kennedy's demands to dismantle and remove Soviet offensive weapons from Cuba. The United States government announced on November 11 that air surveillance had revealed that 42 Soviet medium-range missiles had been shipped out of Cuba "during the last few days." (See also MISSILES.) By December 6, 42 Il-28 Soviet medium-range (750-mile) jet bombers capable of carrying nuclear weapons had been shipped from Cuba. Premier Castro refused to permit on-site inspection by the United Nations, however, and the existence of Soviet troops and technicians (estimated at 15,000 or more) was another unresolved problem. (See also INTER-AMERICAN AFFAIRS.)

WILLIAM S. STOKES,
Senior Professor of Comparative Political Institutions, Claremont Men's College.

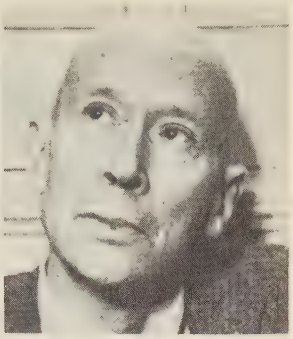
CUMMINGS, E(dward) E(stlin)

U.S. poet, novelist, and painter: b. Cambridge, Mass., Oct. 14, 1894; d. North Conway, N.H., Sept. 3, 1962.

One of the great individualists of 20th century letters, E. E. Cummings stood for the man against the masses. Yet he could jeer at authority and scoff at convention without losing the capacity to express tender emotion. "He was unique among the poets of his time," Mark Van Doren said, "because he was equally superb in satire and sentiment."

The son of a Congregationalist minister and former Harvard English professor, Cummings specialized in the classics at Harvard and received his bachelor's degree in 1915 (M.A., 1916). His early poems appeared with work by John Dos Passos and Robert Hillyer in *Eight Harvard Poets* (1917). Before the United States entered World War I, he joined the volunteer ambulance corps serving the French Army, but was interned because of his association with a suspected anarchist. He based his successful novel *The Enormous Room* (1922) on his experiences in the prison camp. After the war he went to Paris to study painting. He returned to the United States in 1924, went back to Paris in 1930 for several years, and then lived the remainder of his life in New York City and at his farm in Madison, N.H.

In Paris, Cummings met most of the technical innovators in literature and painting who frequented the Left Bank during the 1920's. Although his painting remained frankly sentimental and conservative, his poems displayed a virtuosity of effects that included bizarre verse forms, slang, and typographical oddities of which his apparently erratic use of capital letters became the most famous. He signed his work (but not his checks) e. e. cummings because he preferred, for example, a "SpRIN,k,LiNg" of capitals in the most effective places to a conventional usage that drew undue attention to the wrong words. Although many of these innovations distracted the eye, they helped to convey the immediacy of the poetic experience through visual form, as well as sound and meaning. When the effect of these novelties wore off, the poems often stood forth as clear expressions of great lyric intensity or satiric power.



E. E. Cummings (1894–1962)

UPI

Cummings received the Bollingen Prize in Poetry for 1957, and at the time of his death he was recognized as one of the great love poets of the English language.

His works, in addition to those mentioned above, include: *Tulips and Chimneys* (1923); *XLI Poems* (1925); *&* (1925); *Is 5* (1926); *him: a play* (1927); [no title] (1930); *CIOPW*, drawings and paintings (1931); *W [ViVa]* (1931); *Eimi*, a diary of his trip to Russia (1933); *No Thanks* (1935); *Tom*, a satirical ballet based on *Uncle Tom's Cabin* (1935); *1/20: poems* (1937); *Collected Poems* (1938); *Fifty Poems* (1940); *1 × 1* (1944); *Anthropos—the Future of Art* (1945); *Santa Claus: a Morality* (1946); *XAIPE* (1950); *i: six nonlectures* (1953); *Poems 1923–1954* (1954); *Ninety-Five Poems* (1958); and *One Hundred Selected Poems* (1959).

CYPRUS

Cyprus is the third largest island in the Mediterranean Sea (area, 3,572 square miles; pop., 1961 est., 581,000), lying off the Gulf of Alexandretta some 60 miles west of the coast of Syria. Ceded by Turkey to Great Britain in 1878, Cyprus remained a crown colony from 1925 to 1960, when on August 16 it became an independent republic under treaties with Britain, Greece, and Turkey, which provide for continuance of British military bases on the island. Cyprus is a member of the United Nations and was admitted to the Commonwealth of Nations on March 13, 1961. About 80% of Cypriotes are of Greek origin; nearly 18% are Turkish. The capital and largest town is Nicosia (1960 pop., 87,000); principal ports (with 1960 est. pop.) are Limassol (39,000), Famagusta (28,500), and Larnaca (19,000).

Government.—Under the constitution which came into force on August 16, 1960, the executive branch consists of a Greek president and a Turkish vice president elected for 5-year terms (Archbishop Makarios and Dr. Fazil Kutchuk, respectively, were elected to these offices in 1959), and a Council of Ministers (7 Greek, 3 Turkish). Legislative authority is vested in a 50-member House of Representatives (35 Greek and 15 Turkish members), consisting after the July 31, 1960, elections of 30 members of the Patriotic Front, 15 Turkish Cypriote Nationalists, and 5 members of the Communist-controlled AKEL (Progressive Party of

the Working People). Each of the chief ethnic groups has its own communal chamber, with control over purely internal affairs.

Education and Religion.—Educational institutions, administered by separate communal boards of education, totaled in 1960–61: Greek—526 elementary (67,276 pupils); 34 secondary (22,154 pupils); 120 evening; 2 technical; 1 agricultural; and the Teacher Training College, Nicosia (425 students in 1958); Turkish—229 elementary (15,766 pupils); 21 secondary (5,763 pupils); 109 evening; 2 technical; 6 institutes for foreign languages. The small Armenian, Maronite, and Roman Catholic minorities voted on Nov. 13, 1960, to join the Greek community.

Finance.—Cyprus is a member of the International Monetary Fund, which fixed the initial par value of the Cyprus pound at U.S.$2.80 (as of July 26, 1962). Revenue, 1961: £19,069,170; expenditure, £18,339,523 (development expenditure, £2,587,413). In January the House of Representatives provided funds to start the 1962 section of the Five-Year Plan, which calls for a total government investment of £61,970,000. Revised allocations included (in millions): water supplies, agriculture, and forestry, £24.5; harbor development, £11; electrification, £10.5; roads, £5.5; tourism, £3; health measures, £2.

Transportation and Communications.—Main roads, 1962: 1,046 miles (883 asphalt); secondary roads, 2,900. Air services: British European Airways equips Cyprus Airways on the Nicosia-Cairo and other routes; seven other airlines provide regular services; civilian passengers at Nicosia airport (1960), 92,910. Telephones, 20,458 (1960); radio receivers, 96,182 (1961); television sets, 3,102 (1960).

Economic Indicators.—Gross national product, 1960: £78.4 million; per capita national income, 1960: £139 (the Five-Year Plan seeks to achieve a GNP growth rate of 6.2% annually, and one of 4% for per capita national income). Outstanding public debt, 1960: £13,857,952; outstanding loans, £18,366,537.

Manufactures and Mining.—In 1961, 65,380 members of 354 trade unions were engaged in a wide variety of light manufacturing industries. Cyprus is the second largest exporter of pyrites in the world. Principal mineral products (with export figures for 1960 in long tons): iron pyrites, 815,412; cupreous concentrates, 115,784; cupreous pyrites, 248,931; gypsum, 109,704; asbestos, 15,328; chrome ore, 14,020.

Agriculture.—Farm land occupies about 1 million acres (570,000 acres cropped in 1960). Chief production: wheat, 2 million bushels; barley, 2,406,980 bushels; grapes, 90,125 tons. Forest area: 670 miles; forest roads, 533 miles.

Foreign Trade.—Total exports, 1961: £19,018,000 (down £214,000 from 1960); total imports, £40,416,000 (up £1,286,000). Exports to the United Kingdom: £8.02 million. Imports from United Kingdom: £14,027,936; from United States, £2,412,000. Principal exports (values in millions): minerals, £8.41; citrus fruit, £2.18; potatoes, £1.3; wine, £0.77; carobs, £0.41. Principal imports: foods, £7.36; mineral fuels and lubricants, £3.5; chemicals, £3.47; automobiles, £2.17; beverages and tobacco, £1.2; cotton piece goods, £0.86; cement, £0.27.

Events, 1962.—From May 20 to June 5, President Makarios paid state visits to the United States and West Germany at the invitation of Presidents Kennedy and Lubke, respectively. In Washington his talks with President Kennedy were believed to have focused on the penetration of the Cyprus economy by the Soviet Union and other members of the Communist bloc. Cyprus renewed on Dec. 22, 1961, a barter agreement with the USSR, and subsequently signed similar agreements with Yugoslavia (Jan. 5, 1962), Bulgaria (February 2), Czechoslovakia (February 6), Hungary (March 6), and Poland (March 17). Poland also contracted to improve Famagusta harbor. In a conference with Archbishop Makarios on August 30 during an official visit to Cyprus, U.S. Vice President Lyndon Johnson voiced the concern which Cyprus' relationships with Communist countries had caused among the NATO allies, in view of the importance of Cyprus as the chief army and air base of the West in the eastern Mediterranean and the site of a United States radio relay and monitoring service. Earlier, President Makarios had stated that the trade agreements with the Communist bloc were only "temporary measures made necessary by the island's agricultural surpluses," and that the Westward orientation of his government remained unchanged.

President Makarios and Vice President Kutchuk met in Nicosia on April 2 with Duncan Sandys, British secretary of state for Commonwealth relations, with whom they discussed the adverse effect on the republic's economy of any reduction of British forces at the Royal Air Force base at Akrotiri and the staging base at Dhekelia. They also called attention to the possibly "disastrous consequences" for Cyprus of Britain's proposed entry into the European Economic Community (EEC). (More than a third of Cyprus' exports are taken by the United Kingdom.) In October the government requested negotiations with the EEC, aimed at the admission of Cyprus as an associate member.

Scattered acts of violence, including the explosion of two bombs placed in Turkish Cypriote mosques, marked the seventh anniversary of the EOKA terrorist movement (April 1), which until the achievement of independence had sought to bring about the union of Cyprus with Greece.

DONOVAN ROWSE,
Author and Publicist.

CZECHOSLOVAKIA

The Czechoslovak Socialist Republic (ČSSR), a Soviet-dominated and Communist-ruled state of central Europe, has an area of 49,354 square miles and a population officially estimated (March 1962) at 13,820,300. The chief cities, with their populations (1959 estimates), are Prague (Praha), the national capital, 990,000; Brno, 312,000; Ostrava, 231,698; Bratislava, capital of Slovakia, 256,700; Pilsen (Plzeň), 136,854. Of the total population, there are approximately 9 million Czechs, 3.75 million Slovaks, 0.5 million Magyars, and 0.5 million of other nationalities.

Government.—The constitution of July 11, 1960, officially defines Czechoslovakia as a "socialist republic," a description previously used only by the Soviet Union, in contrast to the term "people's republic" used by all other Soviet-bloc countries. A significant change in the 1960 constitution was the reduction of Slovakia's local autonomy, although Slovakia retained its own National Council. The constitution provides for a unicameral National Assembly of 300 elected members, who serve four-year terms. The president is elected by the Assembly for a five-year term. Antonín Novotný has been president since Nov. 19, 1957. Villiam Široký, the premier, was first elected on March 21, 1953.

Actual power in Czechoslovakia is held by the Communist Party through its local and national organizations and the Communist-controlled National Front. The Communist Party is headed by President Novotný, who is first secretary of the Central Committee, and Karol Bacílek, first secretary of the subsidiary Slovak Communist Party. In 1960 the party had 1,559,082 members, or 12% of the total population—a higher percentage than in any other Soviet-bloc country.

Education.—The educational system has been secularized, nationalized, and modeled on that of the Soviet Union. Soviet-type 11-year schools have been established, and, as in the Soviet Union, a law provides for nine years of obligatory schooling, including part-time work in agriculture and industry. Number of schools (with enrollments), 1960: 12,581 primary (2,220,781); 451 secondary (78,754); 724 technical and normal (145,493); and 30 higher (88,564). In 1961, about 2,700 foreign students from 80 countries attended Czechoslovak universities. The five universities are the Charles University in Prague; the universities in Brno, Bratislava, and Olomouc; and the new University of the Seventeenth of November.

Religion.—The religious distribution of the population is: Roman Catholics, 9,300,000; Protestants (Lutherans, Calvinists, etc.), 780,000; members of the Czechoslovak church, 1,000,000; Eastern Orthodox, 465,000; and Jews, 18,000 (1961 est.). The official policy of the government is to discredit and destroy religion; every effort is made to use the church for the promotion of state policies. A law of October 14, 1949, made the clergy civil servants of the government, and clergymen were obliged to sign an oath of allegiance to the state. A special agency for church affairs handles religious matters. The religious life of the Jewish minority is supervised by the Council of Jewish Religious Communities in the Czech regions of Bohemia and Moravia and by the Central Union of Jewish Religious Communities in Slovakia.

Finance.—The Czechoslovak monetary unit is the koruna (crown), which has an exchange value of 1.80 koruny to 1 ruble, or 7.20 crowns to the U.S. dollar. The

budget for 1962 was balanced at 123.2 billion koruny (up 7.5% over 1961). Of total expenditures, 64.8 billion koruny were allotted to the planned development of the economy, 44.9 billion to cultural and social work, 10.8 billion to the defense and security of the state, and 2.7 billion to administration and the law courts.

Transportation and Communications.—Transport networks (miles, 1961): railroads, 8,400; roads, 80,901 (1957); navigable waterways (the Danube and Vltava rivers), 281. In 1961, Czech railways carried 205.6 million tons of freight, a 50% increase since 1955; 198 electric locomotives and 149 diesel engines were added to the rolling stock in 1961. Merchant fleet, 1960: 11 vessels (85,000 gross registered tons). Other communications data for 1961: radio receivers, 3,141,000; television sets, 1,089,449; telephones, 904,000 (June, 1962).

Agriculture.—As of September 1962, 91% of the land was collectivized. During 1961 and early 1962 more than 2,800 collectives were merged into larger units; the average size of each collective unit was 1,450 acres in the Czech provinces of Bohemia and Moravia and 662 acres in Slovakia. At the same time, however, greater efforts were made to eliminate private plots, and this development has caused considerable discontent.

In 1961, agricultural production suffered a severe setback, and all indications are that the planned 23% increase in the agricultural sector provided by the third five-year plan (1961–65) will not be achieved. Production of major crops in 1960 was as follows (in thousands of metric tons): wheat, 1,503; rye, 895; barley, 1,745; oats, 1,020; potatoes, 5,093; and sugar beets, 8,368.

Industry.—The third five-year plan envisaged a 54% increase in overall industrial production between 1961 and 1965. The stress was on the chemical industry, heavy engineering, and steel. The plan also called for expansion of the labor force and large increases in labor productivity. In 1961, industrial production rose to a level just short of the planned goal. The chemical industry overfulfilled its goals, but pig iron, steel, and rolled materials fell short, causing repercussions in other closely related spheres. The number of workers in industry (12,367,000 in 1961) exceeded the planned target, but labor productivity fell short of its mark. The 1962 plan called for continued industrial development, as well as for the "further leveling of economic standards of individual regions." Consumer products were expected to increase by 6.3% over 1961 production. In 1962, however, Czechoslovakia had serious failures in both collectivized agriculture and industry. As a result the third five-year plan was abandoned, a new one-year plan for 1963 was drawn up, and a seven-year plan (1964–70) was introduced to coordinate the country's economy more closely with other Soviet-bloc countries.

Chief industrial products and 1961 production figures (in millions of metric tons, with 1962 goals in parentheses): hard coal, 26.2 (27.3); brown coal, 61.4 (65.0); steel, 7.0 (8.0); coke 8.5 (9.1); rolled material, 4.7 (5.4); fuel, 1.9 (2.2); cement, 5.3 (6.5); cotton material, 463.5 million meters (488.5); electricity, 26.9 million kw.-hr. (29.7).

Foreign Trade.—Total imports, 1961: 14,570 billion koruny (13,072 billion in 1960); exports, 14,733 billion (13,892 billion in 1960). Approximately 75% of Czechoslovakia's trade in 1961 was with other Soviet-bloc countries. Czechoslovakia stands third behind the Soviet Union and China in intra-bloc trade credits, and has made substantial contributions to the underdeveloped nations of Asia, Africa, and Latin America in the form of financial and technical aid. From 1953 to 1961, Czechoslovakia granted loans and credits amounting to 1,389.8 million old rubles ($367.4 million).

Events, 1962.—Despite the fact that President Novotný has aligned his country firmly behind Khrushchev against Communist China, and against the concept of Communist polycentrism advocated by the Italian Communist leader Palmiro Togliatti, Czechoslovakia's relations with the Albanian and Italian Communists seemed to have improved in 1962. Trade with Albania even grew, and in July a Czech party delegation under Central Committee Secretary Vladimír Koucký spent two weeks in Italy on a mission aimed at improving relations with Togliatti's Communists.

In January it was announced that regular commercial flights between Havana and Prague would be opened immediately. In February, Czechoslovakia and Cuba signed a trade treaty under which trade between the two nations was anticipated to reach $100 million in 1962.

At a session of the Central Committee of the Communist Party on February 6–7, Rudolf Barák, a deputy premier, one-time minister of the interior, and (since June 1961) chairman of the Government Commission for National Committees, was expelled from the party and ejected from all state and public functions on charges of abuses of official duties. Barák was sentenced by a high military court to 15 years' imprisonment and confiscation of all his property. The trial, which avoided show and publicity, was noticeable in its contrast to earlier Stalinist purge trials.

The culmination of the government's de-Stalinization campaign was the destruction in October of the huge statue of Stalin which stood on Letná Hill in Prague. It was also decided to move the remains of the former Stalinist leader Klement Gottwald, first Communist president of Czechoslovakia, from his glass-topped coffin on Vitkov Hill, and rebury him elsewhere.

Following a meeting in early July of the National Assembly, President Novotný proposed several changes in the cabinet and the State Planning Commission. The proposals were immediately adopted and resulted in the eviction of Deputy Premier Otakar Simunek from his position as chairman of the State Planning Commission. Simunek was assigned to the organization and direction of Czechoslovak activities with respect to the Council for Mutual Economic Assistance (COMECON) and other lesser duties. Alois Indra succeeded Simunek as chairman of the commission.

COMECON continued to move haltingly forward in 1962. Its most notable achievement was the oil pipeline, opened in February 1962, which linked the Volga oilfields in the USSR with Poland, East Germany, Hungary, and Czechoslovakia.

On July 24 the draft of the new party statute was published for discussions prior to the 12th Communist Party Congress in December. It followed the Soviet party draft of 1962 in many respects. The statutes are to replace those passed in 1952, and they constitute a party constitution for at least the next four years. The Czech draft is much stricter than its Soviet counterpart. No provision is made for amendment, once the document is adopted, until the next party congress. Nor are any provisions made for removal of Central Committee members. Another striking difference is that the Soviet draft stipulates secret ballots for party bodies, while the former does not. The Czech draft also extends the term of party service required as a qualification for service as a functionary, so that regional and district leaders must be selected from older party members. The apparent effect of the statute, if adopted, will be to further strengthen President Novotný's tight grip on the nation.

Novotný arrived in Moscow on October 30 for a brief visit, during which he presumably discussed with Soviet leaders his country's economic difficulties and the Cuban crisis. Czechoslovakia had sent to Cuba military arms and economic aid worth an estimated $40 million to $100 million. The Czechoslovak press bitterly attacked the United States quarantine of Cuba, and, as in other Soviet-bloc countries, the Czechoslovak armed forces were placed on a combat-readiness alert during the crisis.

Zdeněk Nejedlý, president of the Czechoslovak Academy of Sciences and a minister without portfolio, died in March. He had been highly esteemed as a leftist historian during the 1930's, had served as a deputy premier after World War II, and was a member of the Communist Party Presidium and Central Committee. Rudolf Strechaj, a deputy premier and the chairman of the Slovak National Council, died on July 28. He was the top Slovak liaison man in the central government.

The first half of 1962 brought continued eco-

nomic progress in industrial production, which increased by 6.8% over the first half of the previous year but still fell about 1% short of the planned goals. Perhaps more important was the fact that key industries such as metallurgy, heavy engineering, and transport failed to meet their goals. Major projects were held up as a result, particularly the construction of power stations and the East Slovak ironworks.

Czechoslovakia has hesitated to follow the actions of the Soviet Union and other Soviet-bloc countries in raising the prices of certain foods and consumer goods. In August 1962 the Central Committee announced its intention to set up a Commission of People's Control at all levels of the economy. The function of the commission would be to mobilize the population for "a consistent execution of state and social tasks," and for the "protection of socialist property."

Agricultural production fell far short of the planned goals in the first half of 1962. According to official figures, agricultural production in 1962 was only 7% greater than the prewar level. In late summer the authorities were compelled to plead for volunteer brigade work to help harvest crops because of labor shortages and inefficiency.

As of April 1, social security benefits were extended to farmers on collective farms, but they were considerably less favorable than those given to industrial workers, for farmers are the only group which must pay for part of this social service.

Professor of History, Stanford University.

DANCE—The January 17 premiere of *A Midsummer Night's Dream* highlighted the 1961–62 winter season of the New York City Ballet.

NEW YORK CITY BALLET

DAHOMEY

Situated in western Africa on the Gulf of Guinea, the Republic of Dahomey has an area of 44,696 square miles and a population of 2,050,000 (1961 est.). More than half the population is of the Fon-Adja ethnic group; the remainder comprises various Negroid tribes and a small minority of 800 Europeans, mostly French. The official language is French. Principal cities: Porto-Novo, the capital (1956 est., 31,500); and Cotonou, chief seaport and commercial center (54,100).

Government.—Formerly a French overseas territory within French West Africa, Dahomey became independent on Aug. 1, 1960. The constitution of Nov. 25, 1960, provides for a presidential-type government and a National Assembly of 70 members elected for a 5-year term by universal suffrage. Hubert Maga, leader of the dominant Party of Dahoman Unity, was elected president to a 5-year term in the elections of Dec. 11, 1960. Dahomey is a member of the Council of the Entente.

Education and Religion.—School attendance has doubled since 1951 and is concentrated in the urbanized south. School enrollment, 1959: 91,068 (about 30% of the school-age population), including 88,199 primary pupils and 2,869 secondary students. The people are mostly animists; there are some Christians in the south and a few Muslims in the north.

Finance.—The estimated budget for 1962 was balanced at 6,300 million francs CFA (246.85 francs CFA equal the U.S. dollar). The French government in 1962 supplied 1,200 million francs CFA of total receipts, and provided other aid in the form of loans and economic grants.

Transportation.—Dahomey's relatively advanced transportation system includes three railway lines which connect the seaport of Cotonou with the interior and aggregate 360 miles of track; 871 miles of all-weather roads; and 2,367 miles of secondary roads. Cotonou has a deep-water port and an international airport.

Production.—The economy is predominantly agricultural. Cassava and corn are the chief food staples in the south, and millet and yams are the main subsistence crops in the north. Cattle, sheep, and goats are raised in the northern uplands. Fishing in the southern lagoons is important; 2,429 metric tons of fish and fish products were exported in 1961. Chief cash crops (metric tons exported, 1961): palm kernels, 48,482; palm oil, 8,973; peanuts, 12,522; shea nuts, 2,891; and green coffee, 2,089. Industry consists chiefly of handicrafts and plants for processing agricultural products.

Foreign Trade.—Total exports, 1961: 3,204 million francs CFA (down 29% from 1960); imports, 5,609 million (down 26%). Chief exports (in million francs CFA, 1961): palm kernels, 1,358; peanuts, 550; and palm oil, 428. France in 1961 took 80% of Dahomey's exports and supplied 66% of its imports.

Events, 1962.—Early in the year the National Assembly approved a four-year economic and social development plan (1962–65) to increase the country's agricultural and industrial production by about 50%. In its first year of operation the plan cost an estimated $25.2 million, of which $4.2 million was provided by France and the remainder by Dahomey and other African states. The five-year plan is the first installment of a 20-year program which aims to double the country's per capita annual income of 34,000 francs CFA ($138). President Hubert Maga announced on February 14 that he had reshuffled his cabinet in order to "streamline the governmental machinery" necessary for carrying out the development plan.

W. R. F.

DAIRY PRODUCTS

United States milk production in 1962 was about 126.5 billion pounds, according to preliminary estimates of the Agricultural Economic Re-

search Service. Such production would be a billion pounds larger than the 1961 production of 125.5 billion pounds, and a new record. Annual milk production per cow rose to 7,325 pounds, compared with 7,211 pounds in 1961 and 5,374 in 1952. The number of milk cows at mid-year 1962 was estimated to be 17,270,000, as against 17,395,000 a year earlier and 21,291,000 in 1952. Except for the year 1953, the trend in milk cow numbers has been downward since 1944.

The milk equivalent of Commodity Credit Corporation (CCC) purchases for price support in the first 10 months of 1962 was at an annual rate of about 11.3 billion pounds. This was about 9% more than the previous record of 1953. Purchases in 1962 were estimated at 435 million pounds of butter, 215 million pounds of cheese, and about 1,375 million pounds of nonfat dry milk. Such purchases are equivalent to about 9% of production.

Total civilian consumption of milk and dairy products was about 117 billion pounds of milk equivalent, or 1.5 billion more than in 1961. Most of the gain was due to substantially heavier CCC donations of dairy products for welfare and the school lunch and special milk programs. Per capita consumption was about 640 pounds of milk equivalent, the same as a year earlier, but 60 pounds less than a decade earlier. Per capita consumption of fluid milk and cream was only 312 pounds, compared with 314 in 1961 and 352 in 1952.

U.S. PER CAPITA CONSUMPTION OF CERTAIN DAIRY PRODUCTS AND MARGARINE

(In pounds)

	1947–49	1952	1961	1962[1]
Fluid milk and cream	359	352	314	312
Evaporated milk	18.1	15.7	10.7	9.9
Frozen dairy products	47.7	47.3	51.3	51.1
Cheese	7.0	7.6	8.5	9.0
Butter	10.6	8.6	7.4	7.4
Margarine	5.6	7.9	9.5	9.3

[1] Preliminary.

According to preliminary estimates of the Foreign Agricultural Service, milk production in 34 countries which normally account for about 85% of the world's production was about 620 billion pounds, or 1% more than in 1961. Production was larger in all but seven countries, but only in East Germany and Chile was the decline 5% or more.

In western Europe, which accounts for more than a third of world output, production was up about 1%. Only in Denmark, France, and Italy did output fall. Eastern Europe also showed a gain of 1%, despite declines in East Germany and Hungary. Compared with 1951–55, world milk production was up about 25%.

MILK PRODUCTION IN PRINCIPAL COUNTRIES

(In million pounds)

	Average 1951–55	1961	1962[1]	1962 compared with 1961
Canada	16,339	19,245	19,435	101%
Mexico	3,806	5,998	6,530	109%
United States	119,222	125,456	126,500	101%
Belgium	7,771	8,702	8,825	101%
Denmark	11,521	12,178	12,000	99%
Finland	6,147	7,936	8,165	103%
France	38,051	52,846	52,210	99%
Germany, West	36,023	43,810	45,395	104%
Ireland	5,257	6,727	7,000	104%
Italy	16,663	21,485	21,055	98%
Netherlands	12,654	15,329	15,940	104%
Norway	3,554	3,571	3,655	102%
Sweden	9,829	8,862	8,850	100%
United Kingdom	23,250	29,019	29,975	103%
Germany, East	8,616	11,580	11,025	95%
Poland	20,651	28,625	28,600	100%
USSR	79,080	113,000	116,000	103%
Argentina	10,108	9,761	9,565	98%
Brazil	7,294	11,618	11,685	101%
Australia	12,518	14,683	15,345	104%
New Zealand	11,187	11,889	12,230	103%

C. J. Enzler,
Information Specialist, Office of Information, U.S. Department of Agriculture.

DALLAS

Rapidly growing Dallas, Texas, with a population in 1960 of 679,684 (1962 est., 725,000), advanced in the decade 1950–60 from 22d to 14th among the most populous United States cities, and retained the distinction of being the nation's largest city not served by water transportation. It is the seat of Dallas County, and the center of a four-county standard metropolitan area (3,653 square miles; 1962 est. pop., 1,250,000). Area within the city's corporate limits: 283.4 square miles, or 31% of the county area.

Dallas and its metropolitan area support a diversified economy which employed 474,040 people as of Aug. 1, 1962, about 25% of whom were in manufacturing. The city is the largest wholesale trade center in the South; a major insurance, finance, and service center; and a leading international spot-cotton market. Principal manufactures are clothing, food processing, aircraft, automobile assembling, and electronics. Recently the container industry has become well-established in the area, as has the paint industry. Such indicators as bank debits, postal receipts, consumption of gas and electricity, residential and nonresidential construction, and employment reveal that economic activity of the area increased approximately 11% during the year ending June 30, 1962.

Dallas has a council-manager form of government headed in 1962 by Mayor Earle Cabell, one of a 9-member Council popularly elected biennially. City Manager Elgin Crull has served continuously since 1952.

For the fiscal year 1962–63, city budget: $82,994,800; assessed valuation for tax purposes: $2,541,000,000; tax rates per $100 assessed value: city, $1.56; schools, $1.25; and hospitals, $0.46. Long-term net debt: $184,499,664.

Work was begun in 1962 on a $19 million County Government Center to be erected in downtown Dallas. The largest construction project begun during the year was the 50-story First National Bank building, to be the tallest building west of the Mississippi. Total dollar volume of construction in Dallas in 1962 set an all-time record, exceeding the old high of $190 million set in 1961.

In 1962 the U.S. Army Engineers released an eagerly awaited report affirming the feasibility of a 360-mile barge canal on the Trinity River from Galveston Bay on the Gulf of Mexico to Dallas and beyond. The favorable report constitutes a major step nearer to realization of water transportation for Dallas. Canalization is one phase of the proposed $900 million Trinity River improvement program.

Two highly controversial issues of major proportions emerged in Dallas in 1962. Federal authorities announced a policy opposing further development of Love Field, the city's busy airport located close in, and favoring expansion and joint use of Carter Field, located midway between Dallas and Fort Worth, and owned by the latter. Self-supporting Love Field, built at a locally financed cost of $45 million, ranked seventh nationally in 1962 in the number of passengers enplaned and in air cargo loaded, and sixth in airmail loaded. Eight commercial airlines operate at Love Field.

The second issue arose over construction of 3,000 additional units of new low-cost housing to eliminate substandard dwellings in West Dallas, as urged by Mayor Cabell. Stormy conservative opposition to the expansion of public housing forced a referendum on November 6, and the proposal was decisively defeated.

In September, the city's public schools entered their second year of peaceful integration under the

"stair-step" grade-a-year plan approved by the federal court.

ARTHUR A. SMITH,
Vice President and Economist,
First National Bank in Dallas.

DAMS

Construction of record-breaking dams continued at a rapid pace in many parts of the world during 1962. Both the structures and their cost established records—a dam nearly 1,000 feet high is said to be under construction in the Soviet Union, and work started on a dam in Pakistan under a $354 million contract, the largest ever awarded in nonmilitary competitive bidding.

Oroville Dam.—Although preliminary work has been under way for several years and the first huge diversion tunnel is nearly completed, the highlight of 1962 on this California project was the award of a $120.9 million contract for the main earth-fill embankment, the largest nondefense, competitively bid contract ever awarded in the United States. The 735-foot-high earth-fill dam is equally impressive itself, with a volume of 78 million cubic yards. Except for a 990-foot-high rock-fill dam which the Soviet Union claims is under construction, Oroville has no equal for height in either earth- or rock-fill dams. The mammoth embankment on the Feather River in north-central California is the key feature in the state's big water project which will involve an unprecedented transfer of water from the mountains in the north to areas hundreds of miles away, as far south as San Diego. In addition, flood-control benefits are estimated at $3 million annually. Work on the dam will continue for at least five years.

Glen Canyon Dam.—At the end of 1962 this graceful, thin concrete arch towered over 500 feet high to plug the Colorado River gorge in Arizona near the Utah border. When it is completed in 1964, 710-foot-high Glen Canyon Dam will be the second highest dam in the United States, at least for a short time. Including its 900,000-kw. powerhouse, which huddles in the curve of its base, the dam will require over 5 million cubic yards of concrete.

Flaming Gorge Dam.—A second concrete-arch dam—also part of the Upper Colorado River Basin Project—Flaming Gorge Dam reached roughly three quarters of its 502-foot height in 1962. Started in 1958, this $30 million, 108,000-kw. project on the Green River in northeastern Utah will be completed in 1964.

Navajo Dam.—Construction crews topped out this 405-foot-high, earth-fill embankment at summer's end in 1962. The 26.4 million-cubic-yard structure holds back the San Juan River in the mesa country of northwestern New Mexico. The Bureau of Reclamation project's primary aim is to provide irrigation water for 110,000 acres on a nearby Navajo Indian reservation.

San Luis Dam.—Preliminary work started in 1963 on this big California dam. On Aug. 18, 1962, President John F. Kennedy set off the ceremonial dynamite blast at the site 150 miles southeast of San Francisco to start the joint federal-state irrigation project. The 75 million-cubic-yard earth-fill dam will share fourth place in volume with Mangla Dam in Pakistan. The 2.1 million-acre-foot reservoir will be filled with water diverted from the Sacramento-San Joaquin Delta. San Luis is part of a $511 million project associated with California's ambitious State Water Project which includes Oroville Dam.

Cougar Dam.—This 519-foot-high, rock-fill dam, now more than 60% complete, will be the world's highest rock-fill dam when it is completed in 1964. (Japan's 432-foot Miboro Dam now holds the rock-fill record.) The U.S. Army Corps of Engineers is building Cougar Dam primarily for flood control on the McKenzie River's South Fork in Oregon.

Missouri Basin.—President John F. Kennedy dedicated this huge project on Aug. 17, 1962 during a tour of the West. The dam itself is essentially complete and ranks as the second largest fill embankment in the world; Fort Peck, also on the Missouri, is the biggest with 126 million cubic yards. Oahe Dam stretches more than 1¾ miles across the Missouri Valley. The 242-foot-high fill contains 91 million cubic yards and forms a reservoir that will eventually reach 250 miles upstream and contain 23.6 million acre-feet of water. Oahe is being built mainly as a flood-control facility, but there is also a 595,000-kw. powerhouse. The first 85,000-kw. generator went on the line in April 1962. Irrigation water for some 750,000 acres will be an added benefit.

The smallest of the six main-stem dams on the Missouri, Big Bend, moved ahead during 1962. The 8,000-foot-long earth-fill dam located near Fort Thompson, S. Dak., will generate first power in 1964.

Canada.—Construction began in earnest in 1962 on Portage Mountain Dam, an ambitious undertaking of the British Columbia government. The rolled, earth-fill embankment on the Peace River will be 650 feet high with a volume of 65 million cubic yards, holding back an 88 million-acre-foot reservoir. A very large 2.5 million-kw. powerhouse is planned for the $880 million project.

Europe.—Roselend Dam in the French Alps, a beautiful and structurally unique concrete dam, was completed in 1962. Combining a buttress design with a concrete supporting arch across a deep gorge, Roselend is a fitting climax to the career of the famous French dam expert, the late André Coyne. The dam is 490 feet high and is located on the Isère River. Its reservoir supplies an underground power plant with an installed capacity of 500,000 kw., the largest in France.

Another notable dam completed in France during 1962 was Monteynard on the Drac River in the Alps. This 510-foot-high concrete-arch dam has its 320,000-kw. powerhouse built into its base to protect the generators from the frequent dangerous rock slides in the steep gorge.

Soviet Union.—During the summer of 1962, some 150 engineers and experts on dams met in the Soviet Union for the 29th Executive Meeting of the International Commission on Large Dams. The conferees returned with eyewitness reports on many of the USSR's hydroelectric projects. The tour behind the iron curtain took the engineers along the Volga River, which is almost completely developed hydroelectrically. Hydro dams already built, under construction, and on the drawing boards will bring the Volga system's aggregate generating capacity to almost 9 million kw. The 2,576,000-kw. Volgograd (formerly Stalingrad) plant is the world's largest completed hydroelectric installation (Grand Coulee's capacity is 1,974,000 kw.). The Kiubyshev Dam power plant, completed in 1957, has a capacity of 2.3 million kw.

All that visitors found at the site of the record-breaking, 990-foot-high, concrete-arch dam reportedly under construction on the Inguri River in Georgian SSR was a sign marking the spot and some evidence of foundation

The Yanhee Dam in northern Thailand, under construction in 1962, is to begin generating 70,000 kw. of electricity in late 1964.

WORLD BANK

investigations. The delegates were not taken to see the 980-foot-high, rock-fill Nurek Dam, said to be under construction on the Vakhsh River near the Afghanistan border, or the mammoth, 5 million-kw. Krasnoyarsk hydroelectric project on the Yenisey River in south-central Siberia. A construction start was claimed on Krasnoyarsk as early as 1958. But the huge Bratsk plant on the Angara River, with a planned power capacity of 4.5 million kw., was displayed. Bratsk began generating partial power late in 1961, even though the dam has reached only about half its full 418-foot height.

Asia.—Construction started in 1962 on the big Mangla Dam project in Pakistan, a key unit in the $1 billion Indus River project which will irrigate vast areas of India and Pakistan. The construction contract for the Jhelum River earth-embankment dam set a record as the largest competitively bid, nonmilitary award ever made, at $354 million. Pakistan also inaugurated its $100 million Karnafuli earth-fill dam in 1962, despite protests from India that the reservoir will flood Indian territory.

Bhakra Dam was completed in India in 1962. This 740-foot-high concrete dam is on the Sutlej River in Punjab State. Prime Minister Nehru officiated at ceremonies dedicating the 450,000-kw. powerhouse. India's Rihand hydroelectric and irrigation project on the River Rihand in Uttar Pradesh State also was completed. The development includes a 306-foot-high, 2.2 million-cubic-yard concrete dam and a 300,000-kw. powerhouse.

Southeast Asia's largest construction project, Yanhee Dam in Thailand, reached more than half its 508-foot height during 1962. This $100 million concrete-arch gravity dam on the Ping River is officially named Bhumiphol Dam, but is more often called Yanhee after a mountain forming one of its abutments. Two 70,000-kw. generators will be installed initially in its powerhouse, with space for a total of eight.

Africa.—This continent's largest water project, the 30-year, $650 million Orange River project in South Africa, is scheduled to get under way in 1963. Five dams, each over 200 feet high, will highlight the development, which also includes two tunnels, one of them 51 miles long. First-stage construction includes the two largest dams, one of which, Ruitge Dam, will be 390 feet high and impound a 32 million-acre-foot reservoir. The main objective of the Orange River program is for irrigation and industrial water supply, but a series of hydroelectric stations will provide a bonus of 177,000 kw. of power.

Preliminary work moved ahead in 1962 on Ghana's big Volta River hydroelectric project which includes Akosombo Dam. This 765,000-kw. installation will feed power in 1967 to a 100,000-ton aluminum smelter also under construction in Ghana. The United States in effect gave the green light to the ambitious undertaking by agreeing in late 1961 to loan Ghana $133 million for the smelter and dam, nearly half of their total cost.

Amid reports that construction was behind schedule on the United Arab Republic's Aswân High Dam on the Nile, in the fall of 1962 the Soviet Union announced that 300 additional Russian technicians were going to Egypt to speed construction, aiming toward first power generation in 1968.

Latin America.—Mexico's largest hydroelectric project, Infiernillo, moved ahead impressively in 1962. The $96 million development on the Balsas River centers around a 492-foot-high, rock-fill dam and a 600,000-kw. underground powerhouse. Also in Mexico, construction proceeded on Raudales Dam, a 426-foot-high dam on the Grijalva River.

DANCE

International exchange of dance troupes received its ultimate impetus in the autumn of 1962 when the Soviet Union's leading ballet company, the Bolshoi of Moscow, toured the United States at the same time that the New York City Ballet spent eight weeks in Moscow, Leningrad, Kiev, Tbilisi, and Baku. It was the American company's first appearance in the USSR, and artistic director George Balanchine's first visit to his homeland in 40 years.

The Bolshoi Ballet.—The Soviet company did not receive quite the measure of American acclaim that it did during its first visit, in 1959. One reason was the retirement of its great prima ballerina, Galina Ulanova, who was in no way replaced by the current leading dancer, Maya Plisetskaya. The second blow to public and critical response came from the choice of repertoire. Much advance publicity was accorded Leonid Yakobson's evening-long spectacle, *Spartacus*. But audiences at the American premiere (September 12) were either appalled or amused by its overblown mimetic style, reminiscent of silent films. *Spartacus* had to be withdrawn from the New York repertoire, and it was not taken on tour.

The public was, on the other hand, captivated by *Ballet School*, an unpretentious work assembled by the ballet master, Asaf Messerer, and designed to display the elements of training to which a Bolshoi dancer is exposed. It had its world premiere on September 17.

Other Cultural Exchanges.—The New York City Ballet was not the only American group to be introduced to foreign audiences via the Cultural Presentations Program of the Department of State. In February, the Alvin Ailey Company, which specializes to a large degree in themes related to Negro folklore, embarked on a 15-week tour of the Far East. George Tapps and his company of tap dancers captivated African audiences. And Martha Graham, America's greatest dance innovator, took her company to Israel and Europe. The Israeli journey was highlighted by the premiere of a new composition based on the legend of Judith and Holofernes, with settings and music by Israeli artists.

IDA KAR

Leading dancer of Bolshoi Ballet of the Soviet Union, on tour of United States in 1962, was Maya Plisetskaya, shown in *Swan Lake*.

Overseas visitors to the United States included troupes from Thailand, India, Rumania, Mexico, Haiti, Morocco, Poland, the Philippines, Ceylon, China, Bali, Spain, France, and the Ukraine. The most stimulating contribution was that of Hindu performer-choreographer, Uday Shankar, whose evening-long *Samanya Kshati* was an original combining of traditional gesture and contemporary motivation.

American Modern Dance.—Despite a chronically unsteady economic picture, there were some new works of major stature in 1962. On April 30, in New York, Pauline Koner premiered an extended three-part solo called *The Farewell*, accompanied by the Mahler *Kindertotenlieder*. Dedicated to the memory of her former teacher, Doris Humphrey, Miss Koner's dance presented the artist at a new level of her development. Pearl Lang's *Apasionada* had its premiere in New York on January 5, with Miss Lang monumental in the central role of a gypsy, symbol of endurance.

The most distinguished full concert was that of Donald McKayle and Company, on April 22, in New York. Whether his themes were those of chain gang victims or the antics of New Orleans

jazz musicians, McKayle imbued all of his subjects with vitality and deep humanity.

Classic Dance.—The New York City Ballet forsook its usually austere approach to decor and costumes in the January 17 premiere of George Balanchine's evening-long *A Midsummer Night's Dream.* No visual effect was omitted, from a delicate shell-shaped divan for Titania, to fog blowing across the stage as the lovers slept; from dozens of tiny golden-wigged sprites, to Puck flying upward and out of sight at the end of the ballet. But more important than David Hays' luminous scenic effects and Barbara Karinska's beautifully detailed costumes was Balanchine's choreographic concept, especially in the first act. There he devised a style of movement that cleverly combined the descriptiveness of mime with the fleetness of dance.

No similar wit and fantasy entered the season's most heralded television "special," Balanchine's *Noah and the Flood,* with a score by Igor Stravinsky. This CBS-TV production (June 14) was stodgy, heavy-handed, and pretentious. The music, too, was singularly uninspired. The profusion of masks, costumes, and elaborate special effects were designed by Rouben Ter-Arutunian.

While the New York City Ballet continued to attract wide and enthusiastic audiences, the nation's other leading companies, the Ballet Russe de Monte Carlo and the American Ballet Theatre, suffered devastating financial difficulties. After a 25th anniversary tour ending in the spring of 1962 and featuring three new works (James Starbuck's *The Comedians,* Frederic Franklin's *Tribute,* and Leon Danielian's *España*), the Ballet Russe disbanded its dancers and made no plans for the September 1962 season. The American Ballet Theatre, heavily in debt, was more fortunate. Invited to make its permanent home at the spacious quarters of the Washington (D.C.) School of Ballet, it was placed under the sponsorship of the Washington Ballet Guild. The plan was for the company to have a season in the capital and a brief series of tours.

Another stroke of good fortune came for the American Ballet Theatre when it was invited to dance Eugene Loring's *Billy the Kid* on May 22 at the White House before President and Mrs. John F. Kennedy and their guests, President and Mrs. Félix Houphouët-Boigny of the Ivory Coast. (The month before, Jerome Robbins' company, Ballets: U.S.A., also appeared at the White House to entertain the shah and queen of Iran.)

In addition to the Washington Ballet Guild (backing the American Ballet Theatre), the Washington National Ballet Foundation was organized to support the Washington Ballet, and the National Ballet Society was formed to back the new National Ballet Company under the artistic direction of Frederic Franklin.

Musical Comedy.—Broadway produced no major dance efforts in 1962. On a minor level, one could mention the dances and direction of Joe Layton for the Richard Rodgers musical, *No Strings,* and the choreography by Herbert Ross, assisted by his wife, former ballerina Nora Kaye, for *I Can Get It for You Wholesale.* Layton attempted to give a "dance feeling" to the entire action of *No Strings.* In so doing, he had the imaginative collaboration of designer David Hays, who devised several mobile elements of decor. *I Can Get It for You Wholesale,* a second-rate musical about a cad in the garment industry, came alive principally in its dance episodes: a sinuous duet for Harold Lang and Sheree North, a tender waltz for Bambi Linn and Ken LeRoy, and an amusing group *hora.*

Jerome Robbins, America's most gifted theater choreographer, was represented by his direction of off-Broadway's *Oh Dad, Poor Dad, Mama's Hung You in the Closet, and I'm Feelin' So Sad,* and by some final touches on the Jack Cole choreography for *A Funny Thing Happened on the Way to the Forum.* In general, however, musical comedy seemed to be momentarily at a standstill, as far as dance was concerned.

DAY, J(ames) Edward. See biographical sketch under UNITED STATES.

DEATH, Causes of

Slightly lower mortality in the United States in 1961 brought the crude death rate to 9.3 deaths per 1,000 population, close to the record low of 9.2 in 1954. Adjustment for the changed age composition of the population brings the 1961 age adjusted rate to 7.3 and the same rate for 1954 to 7.7 per 1,000 population, using 1940 population as a standard. These circumstances have brought the expectancy of life at birth to 70.2 years, the first time the figure has exceeded 70 years.

(A table showing estimated number of deaths and death rates in 1961, compared with final data for 1960, appears at the top of page 199. Selected death rate figures for 1961 which appear below in the text of this article are final, and therefore will not correspond precisely with those in the table on page 199.)

Heart disease, cancer, strokes, and accidents continue as the four leading causes of death. Deaths per 100,000 population from these causes in 1961 were 362.6, 149.5, 105.5, and 50.4, respectively. These four causes alone accounted for 72% of all deaths in 1961.

Pneumonia and influenza together rank 6th among the leading causes and account for over two and one-half times as many deaths as all other infectious and parasitic diseases combined. Generalized outbreaks of upper respiratory disease also tend to hasten death from other underlying causes, and the absence of such outbreaks in 1961 accounts for most of the general improvement over the 1960 mortality.

Mortality from maternal causes in 1961 gave a rate of 3.7 deaths per 10,000 live births, equal to the rate for 1960. The decrease in maternal mortality is shown by the following past rates: 68.9 in 1920–24, 63.6 in 1930–34, 28.1 in 1940–44, and 8.3 in 1950.

Mortality of infants under 1 year for 1961 was at the rate of 25.3 deaths per 1,000 live births, a new low. The declining rate of infant mortality is also noteworthy: 76.7 in 1920–24, 60.4 in 1930–34, 42.4 in 1940–44, 29.2 in 1950, and 26.0 in 1960. The first year of life continues to be the most hazardous of any single year until the late sixties, however. Accordingly, mortality from the groups of diseases that are characteristic of early infancy ranked fifth and accounted for nearly 4% of all deaths in 1961.

All other causes	Residual	116,190	117,058	63.5	65.3

* Estimates are based on a 10% sample of death certificates. The sampling error varies with the number of deaths; for example, the sampling error is 47% for the estimate of 40 deaths from diphtheria; 5% for 3,330 deaths from syphilis; and 0.3% for the 668,170 deaths from diseases of the heart. (Source: U.S. Department of Health, Education, and Welfare, Public Health Service; *Vital Statistics of the United States, 1960* and *Monthly Vital Statistics Report, Annual Summary for 1961*, Part 2.)

DE GAULLE, Charles André Joseph Marie

President of France: b. Lille, France, Nov. 22, 1890.

De Gaulle in 1962 succeeded in ending the seven-year Algerian war, one of the crises that had brought him to power in 1958. He then turned to his grand projects: leading France back to the status of a first-rate power, with her own nuclear striking force; and uniting western Europe into a third force in world politics. In his mystical conception of France's role in the world he often clashed sharply with other Western leaders. He also faced strong opposition at home; but he retained his hold on the people, who had given him his power, and to whom he remained a symbol of French glory.

In the decades preceding World War II, de Gaulle became an authority on mechanized warfare, and in June 1940 was appointed undersecretary for war and national defense. After the fall of France, he became leader of the Free French resistance movement, and on June 2, 1943, organized and assumed direction of the French Committee for National Liberation. When the Allies recaptured Paris, the general returned to the city on Aug. 25, 1944, and five days later he became head of the provisional government of the French Republic. Resigning on Jan. 20, 1946, he remained in the background until the threat of civil war in May 1958 brought his return to power. The National Assembly endorsed him as premier on June 1, 1958, and, after the constitution creating the Fifth Republic was promulgated on October 4, he was elected president on December 21 and installed on Jan. 8, 1959.

Hailing the March 18 agreement at Évian-les-Bains, which tentatively ended the rebellion of the Moslem National Liberation Front (FLN) against French rule in Algeria, de Gaulle announced that a referendum would be held on April 8 in France and one on July 1 in Algeria to ratify the Évian accords. But before the voting was held, de Gaulle, angered by bitter, last-ditch resistance by ultra-nationalistic French *colons* both in Algeria and in France, called on March 23 for the crushing of "the terrorist bands in Algiers and Oran." Gradually the revolt was smashed, and on June 28 the right-wing Secret Army Organization (OAS) accepted a truce with Muslim authorities. The results of the referendums were a victory for de Gaulle: 90 per cent of the French voters and 99.75 per cent of those in Algeria approved the Évian agreements. The future of an independent Algeria was still to be settled; but de Gaulle had freed France of her heaviest burden.

Throughout the year de Gaulle continued to try to obtain support for his idea of a western European confederation within existing organizations such as the European Coal and Steel Community, the European Atomic Energy Community (Euratom), and the European Economic Community (Common Market). De Gaulle's idea of a

President Charles de Gaulle responds to greeting of crowd in Munich on September 8 during his visit to West Germany.

WIDE WORLD

united Europe was of a loosely knit organization of fully sovereign states. In February he and West German Chancellor Adenauer announced that they had resolved their differences on the future political construction of Europe. On June 3, following a week of talks with British Prime Minister Macmillan, a communiqué was issued declaring the community of interests between France and Great Britain on major issues. (See also EUROPE.)

De Gaulle was host to Adenauer's state visit on July 2–8, an event designed to demonstrate the reconciliation between the two countries. (Adenauer met with a cool reception from the French.) As he had many times previously, de Gaulle once more stated that solidarity between France and West Germany was the principal factor in the mutual safety of the two nations and the hopes for a European confederation. The two leaders said that the goal of European unity would be pursued before the end of Britain's negotiations for entry into the Common Market, but stressed that they had no desire to prevent British participation in European organizations. They also discussed the need (in their view) for the reunification of Germany and for a review of the North Atlantic Treaty Organization (NATO) which would recognize the change in Europe's favor of the balance of Western forces. De Gaulle paid a return visit to Germany on September 4–9, and was enthusiastically received by the German people. No major political or economic decisions were made, but the two aging leaders solidified their new informal alliance.

De Gaulle's attitude toward NATO continued to irritate the United States. At a press conference on May 15, the French president challenged the dominance of the United States in the defense plans and forces of western Europe. He again called for a re-examination of NATO, and insisted that France should control her own defense, including nuclear weapons. De Gaulle and U.S. Secretary of State Dean Rusk conferred on June 19 in Paris about misunderstandings between the two countries; their talks, officially described as "friendly, animated, and searching," reportedly solved no problems.

With regard to the Soviet Union, de Gaulle adhered stanchly to his view that negotiations with Chairman Khrushchev over Allied rights in Berlin were useless until Khrushchev offered some tangible concession to the Western powers. In this, France stood alone among the Allies. De Gaulle on February 18 announced that France would boycott the 18-nation disarmament conference in Geneva, held at the ministerial level. (See DISARMAMENT.)

In 1962, as he had since 1958, de Gaulle relied strongly on great executive powers, which his critics viewed as approaching dictatorial control of the country. Probably the most cohesive force in France was the loyalty of the people to their stern leader. This veneration remained steadfast in the face of strong disapproval of de Gaulle's policies by cabinet ministers (six of whom resigned in May), members of the National Assembly, and journalists. It was generally assumed that the death or retirement of de Gaulle would leave a void almost impossible to fill, possibly leading to the chaos of a succession of weak regimes, unless the next president had a strong mandate from the people.

De Gaulle therefore asked the people to ratify a plan for the popular election of the president. (Under the Constitution of the Fifth Republic, the president is named by 80,000 grand electors—national and local officials.) This move brought much criticism because of de Gaulle's bypassing the National Assembly and thereby violating the Constitution. On October 28, 61% of those voting approved the plan. But 24% of the voters abstained, and the winning margin represented only about 46% of the electorate.

The need for a clear line of succession to the presidency had been emphasized on August 22 when the presidential car, carrying General and Mme. de Gaulle and their son-in-law, was ambushed and sprayed with machine gun bullets near Paris, one of the bullets missing de Gaulle's head by two inches. It was the second assassination attempt on the general in two years. Police later rounded up several right-wing extremists in connection with the plot.

Any thoughts that the people were becoming disenchanted with de Gaulle were dispelled in the November parliamentary elections, in which Gaullist deputies won 233 of the 482 seats in the National Assembly; in addition, 30 other deputies of other parties were pledged to de Gaulle's policies. For the first time in almost a century, one party held a majority of votes in the Assembly. It was de Gaulle's most outstanding victory.

(See also FRANCE; FRENCH COMMUNITY; and the Index entry, *De Gaulle.*)

M. L. L.

DELAWARE

A Middle Atlantic state of the United States, Delaware ranks 49th among the states in area (land, 1,978 square miles; inland water, 79) and 46th in population (469,000 on July 1, 1962, a 5.2% increase from the 1960 census figure of 446,292). Urban places with 1960 populations above 5,000 are: Dover, *the capital* (7,250), Elsmere (7,319), Milford (5,795), Newark (11,404), and Wilmington (95,827).

Government.—Chief executive and judicial officers in 1962 included Elbert N. Carvel (Democrat), governor, serving a four-year term; Eugene Lammot, lieutenant governor; Elisha C. Dukes, secretary of state; Mrs. Belle Everett, treasurer; Ernest E. Killen, auditor; Januar D. Bove, Jr., attorney general; George R. Miller, Jr., superintendent of public instruction; and Clarence A. Southerland, chief justice of the 3-member Supreme Court.

The Delaware General Assembly, which convenes annually, comprised 11 Democrats and 6 Republicans in the Senate in 1962 and 20 Democrats and 15 Republicans in the House of Representatives.

Legislation, 1962.—After voting supplementary appropriations of almost $1 million, of which $500,000 was for disaster relief for the coastal area following the storm of March 6–8, the legislature passed an appropriation of $91.7 million for the new fiscal year. The largest single portion of the measure ($40.9 million) was for education; the next largest ($19.4 million) was for debt service. Bond issues amounting to $15 million were authorized, of which the major part was for school construction.

Action was completed on amendments to the state constitution to permit a larger number of judges of the Superior Court; to provide for the continuity of state and local government in emergencies resulting from enemy attack; and to forbid retroactive increases in the personal income tax. New legislation permitted General Motors stock being distributed to du Pont Company stockholders as a result of a court decision to be considered as capital gains rather than dividends, with a resultant saving to the individual stockholders. Credit for disaster loss due to the March storm was also permitted on income tax returns.

Other laws provided for standardized school construction plans, for a Civil Defense Auxiliary Police, for regulation of psychologists and cosmetologists, and for adoption of an Interstate Compact on Mental Health. First passage was given to a constitutional amendment reallocating seats in the General Assembly, but this measure will not become a part of the constitution until it has been approved by the 1963 legislature. (See also below, *Events, 1962.*)

Finance.—In the 1962 fiscal year, revenue of $93,043,146 included $92,215,002 from state taxes and $72,072 in federal funds. Chief tax yields were individual income taxes ($36,194,464), corporate income taxes ($7,295,209), and motor fuel taxes ($10,316,732). Spending of $87,703,978 included $36,952,001 for education, $10,445,831 for health, welfare, and safety, and $7,625,097 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 1,985 teachers enrolled 51,139 pupils; junior and senior high schools with 1,924 teachers enrolled 37,687; and parochial schools with 528 teachers

enrolled 19,103. College enrollment totaled 8,002 in 2 junior colleges and 2 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $55.3 million, including current expenditures of $38.8 million ($475 per pupil) and capital outlay of $15 million. Revenue of $56.2 million was drawn chiefly from state funds ($42 million) and local districts ($8.8 million). The state reported teachers' salaries averaged $5,961 (high school, $6,203; elementary, $5,738). Actual spending for higher education (fiscal 1961) totaled $11,987,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments were made to a monthly average of 13,989 persons. Expenditures included $727,519 for the aged and $2,683,637 for dependent children.

Transportation and Communications.—With 142 miles of highway construction and reconstruction completed in 1961, *highways and roads* as of July 1, 1962, totaled 4,210 miles (3,951 surfaced). These served 218,996 *motor vehicles* (as registered Oct. 1, 1962), including 150,843 automobiles. Operating in the state in 1962 were 3 *railroads* (using 841 line miles of track) and 2 regularly scheduled *airlines*. There were 9 commercial and municipal *airports*.

Communications media included (1962) 8 AM and 3 FM *radio stations;* 3 daily *newspapers* (circulation, 124,521) and 11 other newspapers (36,274); and (January 1) 63,500 business and 162,300 residential *telephones*.

Labor Force.—The state's labor force on June 15, 1962, included 14,900 agricultural workers. Nonagricultural employment totaled 178,100, compared with 175,100 a year earlier and an average of 173,400 for the 12 intervening months. Of nonfarm employees, 31.7% were in manufacturing, 17.1% in trade, and 12.1% in service industries. Unemployment on June 15, 1962, had dropped to 8,900 from the 12,000 reported a year earlier.

Manufacturing.—Manufacturing engaged 58,964 workers in 1960, including 31,645 in production, and provided a payroll of $372,052,000. Adjusted value added by manufacture totaled $516,461,000.

Leading industry groups in 1960 were: chemicals and allied products (5,912 workers; $109,681,000 in adjusted value added by manufacture); food and kindred products (5,691; $51,352,000); and fabricated metals (1,975; $20,795,000).

Mining.—In 1961, Delaware ranked last among the states in the value of its mineral output, with 0.01% of the national total. The 1961 value was $1.053,000 (up 6.5% from 1960), of which $970,000 was for 961,000 short tons of sand and gravel.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $73,260,000, compared with $76,327,000 for the corresponding period of 1961. For the full year 1961, income comprised $67,680,000 from livestock, $37,943,000 from crops, and $2,154,000 in government payments. Principal income sources in 1961 were broilers, $49,350,000, and soybeans, $11,293,000.

The state's 5,000 farms in 1959 had an acreage of 763,000 (416,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 54,000 cattle, 853,000 chickens, and (1961) 337,969,000 commercial broilers.

DELAWARE CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	306	300	260
Barley (1,000 bu.)	461	630	574
Corn for grain (1,000 bu.)	7,367	7,378	7,497
Potatoes (1,000 cwt.)	1,492	2,250	1,995
Rye (1,000 bu.)	244	220	220
Soybeans (1,000 bu.)	2,465	5,160	4,294
Tomatoes	44	36	32

(Source: U.S. Department of Agriculture.)

Events, 1962—In the November elections the Democrats retained control of the General Assembly, gaining 4 seats in the House of Representatives, where they have 24 of the 35 seats, but losing 1 seat in the Senate, where they have 10 of the 17 seats. In a contest for the state's lone congressional seat, Rep. Harris B. McDowell, Jr., was reelected over Republican Wilmer F. Williams.

Although the Democrats won most of the state and county posts at stake in the election, voters showed a willingness to split the ticket, the chief Republican beneficiary of this development being former Acting Gov. David P. Buckson, who was elected attorney general. The selectivity of the electorate and the effectiveness of newspaper publicity was demonstrated by the defeat, though by a very narrow margin, of Harry S. Smith, the incumbent Democratic insurance commissioner. Smith, who had led his party ticket in the 1958 election, now suffered from criticism of his division of the state's insurance business among various brokers without competitive bidding.

Criticism and investigation of state and local officials were current throughout the year. A Wilmington city councilman was indicted on charges of soliciting a bribe for his vote on a housing project contract. Fault was found with the New Castle County sheriff's office for running up a mileage bill of $14,573 in nine months, largely by charging for some trips that were fictional. In the same county, obscure officials called "fence viewers" presented such large claims for compensation that the county court finally refused further payment. Ticket-fixing charges were leveled at Wilmington city police. Attention was called to loose procedure and conflicts of interest in the letting of school bus contracts. The Wilmington Parking Authority was forced to make a change in personnel and in procedures after criticism of its return on investments in parking facilities.

Magistrates, censured particularly for imposing excessive jail sentences, promised to propose reforms which critics hoped would lead to provision for payment by salaries in lieu of fees. A quarrel, partly political, between successive chairmen of the Youth Services Commission led to a change in its direction. Recommendations for greater support and improved organization of the adult correctional institutions seemed to face a doubtful reception.

The major constitutional reform under way in 1962 concerned reapportionment of seats in the lower house of the legislature. Approved by a special General Assembly session, the measure, as a constitutional amendment, would require approval in the 1963 Assembly before taking effect. Meanwhile a court suit sought to force the issue on behalf of populous but underrepresented northern Delaware. The governor's plea for a constitutional convention came to naught.

In March an Atlantic storm destroyed beaches, boardwalks, and vast amounts of private property at ocean resorts, including Rehoboth Beach, Bethany Beach, and Fenwick Island. Inland, the industrialization of Delaware continued with new factories and plants projected by General Foods at Dover, by Leeds Travelware at Clayton, by Air Products and Chemicals at Delaware City, and, after defeat of legal efforts to obstruct it, by Shell Oil in Blackbird Hundred.

Financing was arranged in February for construction of a 53-mile toll expressway linking the Delaware Memorial Bridge, near Wilmington, with Baltimore, Md. The project, a joint undertaking of the two states involved, is due for completion by the end of 1963.

"Legislation" and "Events" by: JOHN A. MUNROE, *Professor of History, University of Delaware; Author of "Federalist Delaware, 1775–1815."*

DEMOCRATIC PARTY

Democrats retained firm control of both branches of the U.S. Congress after the 1962 elec-

UPI

President Kennedy, campaigning for Democratic Party candidates, addresses Louisville, Ky., audience on October 24.

tions, gaining four seats in the Senate although losing four in the House of Representatives. According to the election results, in the new 88th Congress, to meet in January 1963, the Democrats would have had an advantage of 68–32 over the Republicans in the Senate and 258–176, with 1 vacancy, in the House (compared with 64–36 and 261–174, with 2 vacancies, in the 87th Congress[1]). The death of Sen. Dennis Chavez (D, N. Mex.) on November 18, however, gave the Republicans an additional Senate seat when Republican Gov. Edwin Mechem resigned and was appointed to the vacancy. Thus the alignment in the new Senate became 67 Democrats and 33 Republicans.

In the November 6 elections, Democrats overturned Republican administrations in Hawaii, Iowa, Massachusetts, New Hampshire, New Mexico, and Vermont (winning control of the state administration there for the first time in 108 years). They scored a significant political victory in the reelection of Gov. Edmund G. (Pat) Brown of California over Richard M. Nixon, the 1960 Republican presidential nominee. Democrats lost the governorships of the important industrial states of Pennsylvania, Ohio, and Michigan, and were also defeated in Colorado, Oklahoma, and Wyoming.

Close elections, however, left several governorships open to recount or contest. While the Democratic candidate emerged victorious in Massachusetts, Republicans won in the three other disputed states: Maine, Minnesota, and Rhode Island. As a result, the elections resulted in a net loss to the Democrats of one governorship, leaving the national line-up at 33 Democratic and 17 Republican governors.

The Democrats' gains in the Senate were perhaps their most important victories in the elections, for their majority became so great that it could probably not be endangered before 1968. Democrats gained Senate seats in Connecticut, Maryland, New Hampshire, South Dakota, and Wisconsin, and lost seats only in Colorado and Wyoming. In Alabama, however, Sen. Lister Hill, Democrat, was reelected by a margin only slightly above 6,000 votes. This phenomenal Republican upsurge was attributed to deep-South resentment against the national Democratic administration's policies on racial and states' rights issues.

President John F. Kennedy, firmly in the leadership of the Democratic Party nationally and unchallenged from any quarter for renomination in 1964, campaigned for election of party members to Congress with a midterm activity unprecedented for an American president. An officially nonpolitical speaking trip, August 17–18, brought out large audiences in South Dakota, Colorado, and California. From October 5 to 7 he toured parts of Kentucky, Ohio, Michigan, and Minnesota. In Baltimore on October 10 the president declared that "no Congress in our time" had a record of more "positive and progressive accomplishment than the Democratic 87th Congress I salute tonight." He cited particularly the passage of trade, drug-control, minimum wage, and welfare laws, and the increase of space and defense budgets.

In San Francisco on October 8, Dwight D. Eisenhower, the president's Republican predecessor, accused him of seeking "one-party government" in asking for the election of more Democrats. Republican congressional leaders at the adjournment of Congress on October 13 called the Democratic record in the session one of "mismanagement and inefficiency" and denounced as an "unprecedented collapse of the appropriations process" the procedural controversies between House and Senate. On the same day Clarence Cannon, Democratic chairman of the House Appropriations Committee, called the House leadership "biased and inept."

The president continued to campaign vigorously until October 20. With the announcement, on October 22, of an international crisis over Soviet-supported missile bases in Cuba, further campaigning by the president, vice president, and cabinet members was discontinued because of the emergency.

[1] The House was then temporarily increased from 435 to 437 to provide seats for Alaska and Hawaii pending a new apportionment after the 1960 census.

DENMARK

The Kingdom of Denmark consists of the peninsula of Jutland (Jylland) and 496 adjacent islands (109 inhabited), of which the largest are Zealand (Sjaelland), Fyn, Lolland (Laaland), Falster, and Bornholm. The Faeroe (Faroe) Islands (area, 540 square miles; 1960 pop., 34,596), in the Atlantic Ocean between Scotland and Iceland, and Greenland (q.v.), a former dependency, are integral parts of the kingdom, although both have some political autonomy. Excluding the Faeroe Islands and Greenland, the area of the kingdom is 16,975 square miles, and the population (1962 est.) is 4,617,000. The principal cities and their 1962 populations are Copenhagen (København), the capital, 923,974 (Greater Copenhagen, 1,348,454); Aarhus, 117,234; Odense, 129,833, and Aalborg, 96,438.

Government.—Denmark is a constitutional monarchy, ruled under a parliamentary system since 1901. King Frederik IX (b. 1899; acceded 1947) is chief of state, acting through a cabinet responsible to the Folketing, a unicameral legislature. The Folketing elected on Nov. 15, 1960, consists of 76 Social Democrats, 38 Moderate Liberals, 32 Conservatives, 11 Social Liberals, 11 members of the Socialist People's Party, 6 Independents, 2 representatives each from Greenland and the Faeroe Islands, and 1 representative of the German minority. Premier Jens Otto Krag heads a coalition government of Social Democrats and Social Liberals.

Religion.—The Danish Lutheran Church, of which over 97% of the people are members, is the state church, but all religious groups enjoy complete religious freedom, including about 70,000 members of other churches.

Education.—Compulsory education for children between the ages of 7 and 14 has been required by law for a century and a half. Elementary schools enrolled 686,113 pupils in 1961, while 73,520 attended secondary institutions, excluding special technical institutes. Recent changes in the structure of education at these levels increased students in the elementary classes and lowered numbers in the secondary schools. Folk high schools registered 6,975 students in continuation courses; and institutes of higher

education, such as special schools, technical institutes, business schools, etc., had more than 40,000. The enrollment of the universities of Copenhagen and Aarhus was 6,304 and 2,406, respectively.

Social Welfare.—Government social insurance coverage is obligatory for low-income groups, with about 90% of the population under some system of social insurance. Payments are required from all employed persons regardless of whether they have private insurance programs. The national insurance system covers sickness costs, old-age pensions, and disability, unemployment and workmen's compensation. Medical assistance and hospitalization are provided for 80% of the population; and pensions, starting at the age of 67 (62 for women), are graduated according to individual income resources. Low-income families living in subsidized housing are entitled to allowances of 20% to 75% of the rent. Mothers are eligible for household help during vacations and illnesses.

Labor and Management.—The Central Organization of Danish Trade Unions, which has 776,451 members, brings together the majority of laborers. Another 29,363 are in other unions, and 172,597 are in trade or professional organizations. The labor federation maintains strong ties with the Social Democratic Party. The Danish Employer's Confederation, with about 22,218 members, negotiates for industries on collective bargaining; and the Federation of Danish Industries, with 3,000 member firms, serves as an information agency for manufacturing and business concerns and seeks to assist them in marketing products. Local consumer cooperatives have 542,000 members; another 162,000 persons are members of the Danish Union of Cooperative Societies. These organizations help to market farm products, and the former act as retail stores for their members. Nearly 95% of all agricultural exports are processed by farmers' cooperatives.

Finance.—The national budget for the fiscal year 1962–63 planned for income of 9,126 million kroner and expenditures of 8,528 million kroner (1 krone equals U.S.$0.1448). The chief sources of revenue were excise and customs duties (4,997 million kroner), personal taxes on incomes and property (4,150 million), and taxes on corporate income (460 million). The main categories of expenditure were social welfare and welfare (4,375 million), other civil expenditures (1,450 million), education (1,620 million), defense (1,300 million), and investment (1,900 million).

Economic Indicators.—The gross national product in 1961 was valued at 49,150 million kroner, compared with 44,503 million in 1960. The cost-of-living index (1958 = 100) rose gradually during 1961, starting at 104 at the beginning of the year and ending at 109. An inflationary trend was noted because of consumer buying resulting from the imposition of a sales tax of nearly 10% and from larger production and better wages.

Production.—The occupational distribution of population remains fairly constant, with approximately 20% in agriculture, 30% in industry, 8% in construction, 7% in transport and communication, and 13% in commerce. As of June 1962, 0.7% of the labor force was unemployed, the lowest figure on record. Inflation troubles and demands for wage increases in 1961 caused 34 industrial conflicts—the greatest number since 1956—with 153,304 workers involved.

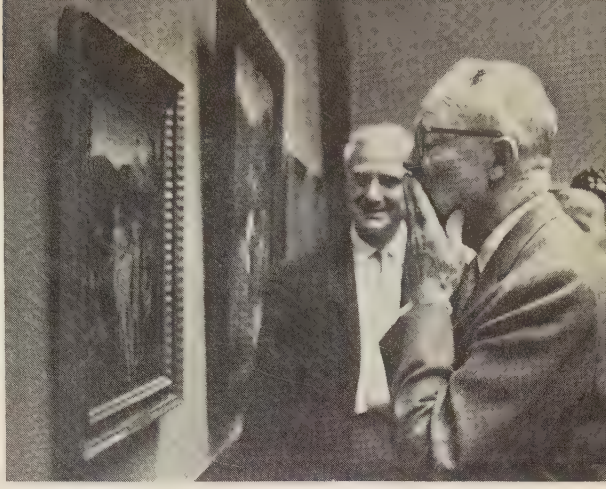
Agricultural products account for more than half of Denmark's export earnings. A slight increase in exports in the first half of 1962 showed a total of 1,947 million kroner, but it was balanced by losses through greater imports of other products. Gross income in agriculture went from 5,500 million kroner in 1960 to 5,372 million in 1961, although net farm profit exceeded 1960.

About 5,529 million tons of milk were produced in 1961, yielding 171,000 tons of butter (120,000 exported) and 122,000 tons of cheese (79,000 exported). Approximately 127,000 tons of eggs entered the market, together with 80,000 tons of poultry (58,000 tons exported). Meat and pork, the latter Denmark's main agricultural export, totaled 921,000 tons, of which 638,000 tons went abroad. Crop output in 1961 included 434,000 tons of wheat, 2,808,000 tons of barley, 684,000 tons of oats, 514,000 tons of rye, 141,000 tons of potatoes, and 18,346,000 tons of root crops.

Denmark, which depends on imports of raw materials to maintain its industries, has steadily increased the share of manufacturing in the gross national product. In 1962, production continued to rise, with strength showing in building, construction, and manufacturing. The value of industrial production totaled 9,350 million kroner in 1961, as compared with 8,350 million in 1960. Production of cement rose to 131,000 tons monthly, and electric power production averaged 391 million kw.-hr. per month in 1961.

Foreign Trade.—The value of exports rose from 10,105 million kroner in 1960 to 10,456 million in 1961, and that of imports climbed from 12,397 million to 12,875 million, for an increase of 479 million. In the first quarter of 1962, foreign trade exports amounted to 2,729 million, and imports 3,519 million, indicating a serious drain on Denmark's reserves. A large part of Denmark's trade is with Britain and West Germany.

Agricultural products ranked highest in the exports in 1961, accounting for 4,514 million kroner; the value of industrial goods amounted to 4,504 million. Imports consisted of raw materials (4,228 million), fuel (1,541 million), chemicals and semimanufactured products (2,548 million). Net holdings of foreign exchange dropped during the first half of 1962 by 243 million kroner to 971 million.



WIDE WORLD

Gen. Dwight D. Eisenhower, on a visit to Europe, appraises a painting in Copenhagen's State Museum of Art on July 27.

Events, 1962.—Debate on Denmark's entry into the European Economic Community, proposed in 1961, continued during 1962. Danish economic ties to England meant that British negotiations for membership in the EEC were watched closely. Proposals for NATO unification led to negotiations with the United States and protests from the USSR. On March 23, Denmark initialed the Treaty of Nordic Cooperation, providing for mutual consultation and agreement on social, cultural, and economic affairs among Sweden, Norway, Finland, Denmark, and Iceland. A sales tax was heatedly debated before its adoption by the Folketing.

An international commission reported on March 30 the results of its inquiry into the shooting incident which had occurred between Danish and British ships on May 31, 1961, in a dispute over fishing grounds off the Faeroe Islands. The commission found both the British trawler and the Danish frigate partially at fault. Denmark demanded on April 28 termination in 1963 of the 1959 agreement regulating the fishing grounds, primarily to establish a 12-mile fishery limit to replace the existing 6-mile limit.

A heart condition forced the resignation of Premier Viggo Kampmann on August 31, and Foreign Minister Jens Otto Krag was named to succeed him. Danish foreign and domestic policy was not affected by the change.

Former President Dwight D. Eisenhower visited Denmark in July during his tour of western European countries.

RAYMOND E. LINDGREN,
Dean, Long Beach State College.

DENTISTRY

The recently published survey of dentistry in the United States[1] has aroused considerable comment among many leaders of the profession. While it emphasized the finding of many highly commendable aspects of the profession, some of its statements have been criticized as not being representative of the true status of the rank-and-file dentist.

Morever, some of its suggestions have been strongly rejected on the basis of experience gained where these recommendations have been tried in other countries. For example, the suggestions that

[1] *Survey of Dentistry; the Final Report,* American Council on Education, Commission on the Survey of Dentistry in the United States (1961).

the profession be fragmented into many divisions and that inadequately trained assistant personnel be employed to execute some of the duties now performed by qualified dentists have been strongly contested. It is the opinion of many dental leaders and educators that it is impossible to train personnel adequately to perform even some of the duties of a graduate dentist in any significantly shorter time than is now considered necessary. Therefore any curtailment of time or curriculum would unavoidably result in the lowering of the standard of dental practice. Fortunately, however, the survey has stimulated an interest in the study and evaluation of the problems facing the profession.

Dental Manpower.—The present shortage of dentists in the United States seems to be largely a matter of regional distribution, according to Dr. B. Duane Moen, director of the American Dental Association's Bureau of Economic Research and Statistics. While the overall national ratio of one dentist for every 1,934 persons would indicate an adequate supply, examination of the regional distribution shows "tremendous geographic variations in the supply of dental services." The dentist-patient ratio among the 50 states ranges from one dentist to 1,180 patients in New York, to one to 4,566 in South Carolina. On a county basis, the disparity is even greater; for example, one county in South Carolina with a population of over 35,000 persons has only one dentist, while in New York, Bronx and New York counties have one dentist for every 760 persons. Thus, assuming the demand for dental treatment to be the same in both localities, South Carolina dentists would have to treat almost 50 times as many patients as the average New York dentist does.

At the present time there are about 94,000 practicing dentists in the United States. That a dentist's productivity is flexible is shown by a recent analysis which showed an increase of approximately 40% in services by the average dentist between 1950 and 1960. These figures notwithstanding, it is believed that the dental profession cannot cope indefinitely with a constantly increasing dentist-population ratio by increasing its productivity alone. Merely to maintain the existing ratio will require the graduation of approximately 5,000 dentists annually by the year 1980.

Electric Toothbrush.—A new aid in the field of oral hygiene has been created with the introduction of the electric toothbrush, currently being manufactured in a number of models. The two most prominent models are somewhat alike in design and function, but differ basically in the type of toothbrushing stroke employed; one uses a reciprocating up-and-down stroke, the other a short but very rapid horizontal stroke through long, flexible bristles. All models employ an electric motor to impart motion to a handle on which removable brushes are attached, thus making it possible for each member of the family to use his own brush with the same holder. Some models operate on ordinary house current through a cord attached to the brush handle. Others operate by batteries, some of which are recharged while the holder rests in its base when the brush is not in use. It is claimed that the average person can accomplish much more in two or three minutes with the electric brush than is possible with the manual toothbrush. The degree of advantage in cleaning and polishing with the electric toothbrush, and in the resultant improvement of periodontal conditions cannot be determined until after further study. There is no doubt, however, about its usefulness for handicapped persons and others unable or unwilling to expend the energy necessary to maintain good daily oral hygiene.

Dental Hearing Aid.—A new type of hearing aid which uses the teeth to transmit impulses for hearing has been granted a United States patent. Invented by a dentist and a physician working together, the new instrument has achieved remarkable results. Although at the present time its size and design make it unsuitable for full-time use, engineers are endeavoring to reduce it ultimately to the size of a single tooth. The device operates through an intra-oral receiver, actuated by a tiny radio transmitter worn externally on the body but not connected by wire to the receiver. A combination of the fifth, seventh, and ninth cranial nerves carries the signals from the receiver to the auditory apparatus. It is believed that a considerable amount of developmental research will be needed before the unit will be made available to the public.

DETROIT

Although its population dropped from a 1960 census figure of 1,670,144 to an estimated 1,629,000 in November 1962, Detroit, Mich., remained the fifth most populous city in the United States. The city, which fans out from the Detroit River over an area of 139.6 square miles, is the center of a three-county (Wayne, Oakland, Macomb) metropolitan area of 1,965 square miles (1962 est. pop., 3,836,000).

The city is governed by a mayor (in 1962, Jerome P. Cavanagh) and a 9-member City Council, all elected for 4-year terms.

Net city tax budget (1962–63 fiscal year): $116,143,989. Gross city budget (actual appropriations): $280,310,106. Total city budget, including self-sustaining agencies: $351,718,969. Net bonded debt (Dec. 31, 1961): $400,950,337. City tax rate (1962): $25.212 per $1,000 assessed valuation. School tax rate: $18.812. School budget: $151,360,005. Public school enrollment (September 1962): 292,119.

Employment in the metropolitan area in the first 10 months of 1962 averaged 463,700 in manufacturing (down 6,700 from 1961); 539,000 in nonmanufacturing (down 9,200 from 1961); and 140,100 in government (up 7,900 from 1961).

Retail sales in the metropolitan area in 1961 were estimated at $4,534,204,775, down $410,677,024 from 1960. On Aug. 15, 1962, the city cost-of-living index stood at 102.3 (1957–59 = 100), or 3.1 points below the national city average.

For Detroit, 1962 was a year of building, as some $80 million in major downtown business and apartment construction was either started or nearing completion. Of major significance was the groundbreaking (October 15) for a 435-room hotel in the civic center, the first major Detroit hotel building in 35 years. Located across from the giant Cobo Hall and Convention Arena, the hotel was expected to encourage tourist and convention business. Other major building projects included the $16 million, 28-story Detroit Bank & Trust Company main office; the $20 million, 32-

story Michigan Consolidated Gas Company building; the $10 million, 23-story First Federal Savings & Loan Company main office; Lafayette Towers, a $14 million apartment complex; and 1300 Lafayette East, a $9 million apartment project.

A 1% income tax on residents and nonresidents was placed in effect on July 1 in an effort to ease the city's fiscal problems. The new levy, which affects some 165,000 suburban residents who work in Detroit, as well as local wage-earners, precipitated a heated controversy.

The city's economy was stimulated in late 1962 as its automotive plants increased production schedules and added workers to meet high demand for 1963 models.

In an effort to obtain more defense contracts for Detroit and Michigan manufacturers, the nation's first Defense Contract Information Center was opened in Detroit on August 31. The center will work closely with the new U.S. Army Mobility Command, which set up its main headquarters in Detroit in June.

A major news event was the sinking in the Detroit River on July 30 of the 444-foot British freighter *Montrose,* following a collision with a cement-loaded barge. The vessel, awash in 45 feet of water, was raised after a difficult salvage operation.

A series of strikes against Detroit's two daily newspapers, the *News* and the *Free Press,* caused suspension of publication for 29 days in April and May.

DIEFENBAKER, John George

Prime minister of Canada: b. Neustadt, Grey County, Ontario, Sept. 18, 1895.

A noted criminal lawyer in Saskatchewan, John Diefenbaker was elected to the federal House of Commons in 1940 as a Progressive Conservative, from a province that traditionally elected Liberals and Socialists; it was his first success in six attempts to win public office. Named leader of his party on Dec. 10, 1956, he became prime minister after the elections of June 10, 1957, when the Conservatives won 113 seats in the 265-member House, a plurality but not a majority. The elections of March 31, 1958, gave him an absolute majority, 208 seats; in April 1962 the Conservatives controlled 203 seats, the Liberals 51.

In the face of serious economic problems and a decline of popular support, Prime Minister Diefenbaker called for elections to take place on June 18, 1962. The voters sent 116 Conservatives and 99 Liberals to the House of Commons, thus depriving the Conservatives of their majority and leaving them dependent on the support of the Social Credit Party, whose 30 representatives controlled the balance of legislative power.

On June 24 the prime minister announced a plan that included the borrowing of $1 billion to bolster the currency, and austerity measures to correct the imbalance of international payments and the budgetary deficit ($575 million for 1962–63). When the new Parliament met, the Liberals introduced two motions of no-confidence, but both were defeated on October 4 by a coalition of Conservative and Social Credit votes.

In foreign affairs, Diefenbaker continued to lead the Commonwealth bloc opposed to Great Britain's entry into the European Economic Community (Common Market). In spite of reassurances of trade guarantees by British Prime Minister Harold Macmillan on a visit to Ottawa (April 30–May 1), Diefenbaker expressed dissatisfaction with Macmillan's proposals during British negotiations

with the Common Market, at a meeting of Commonwealth prime ministers in London on September 10–19.

Although he had earlier pledged an independent policy for Canada in regard to Cuba, during the Cuban crisis in October, Diefenbaker pledged full Canadian support to the United States and denied the use of Canadian airfields to Russian military aircraft bound for Cuba. (See also CANADA.)

DIETETICS. See FOOD RESEARCH; NUTRITION.

DILLON, (Clarence) Douglas

U.S. secretary of the treasury: b. Geneva, Switzerland, Aug. 21, 1909.

After attending Groton School and Harvard University, from which he received his B.A. degree in 1931, he joined his father's Wall Street firm of Dillon, Read & Company, Inc., where he became active in the foreign investment field. Following duty during World War II as a naval officer, he was board chairman of the company from 1946 to 1953. In 1949–52 he served as chairman of the Executive Committee of the New Jersey Republican State Committee. From 1953 until 1957 he served as ambassador to France, returning to the United States to become deputy under secretary of state for economic affairs and, in 1958, under secretary. Named secretary of the treasury by President-elect Kennedy, his appointment was confirmed by the Senate on Jan. 21, 1961.

During 1962, Dillon worked toward freer trade relations and the expansion of United States exports. He led the United States delegation to the seventh annual meeting of the United States–Canadian Committee on Trade and Economic Affairs on January 12–13 in Ottawa, which stressed the support of freer trade by both countries and reviewed problems arising from Britain's proposed entry into the European Economic Community. His report on the balance of international payments of the United States, in which he urged further cuts in government spending overseas and the promotion of trade expansion, was sent to Congress by President Kennedy on March 28.

In a speech on June 4 before the New York Financial Writers Association, Secretary Dillon indicated that the administration was planning a broad reduction in income tax rates as a part of its overall tax reform bill to be presented to Congress in 1963. He reiterated this expectation on November 15 in Washington, D.C., at the Conference on Fiscal and Monetary Policy sponsored by the President's Advisory Committee on Labor-Management Policy.

Secretary Dillon headed the United States delegation to the first annual Conference of the

Alliance for Progress, which met in Mexico City from September 30 to October 27. Named second vice president of the conference, he stated on October 23 that the alliance was achieving its purpose of integrating Latin America's economy and pledged continued United States support of the program in 1963.

DIPLOMATIC LIST. See AMBASSADORS AND ENVOYS.

DISARMAMENT

"No progress"—a phrase used by the United Nations Disarmament Committee to describe its negotiations during the year—aptly described developments in the disarmament field in 1962. Negotiations on disarmament among the major nuclear powers again failed to produce an agreement for mutual arms control. The postwar arms race between the Communist and Western nations brought the world perilously close to thermonuclear war during the Cuban crisis in late October, but this dangerous development apparently had little effect in making any of the great powers anxious to disarm. In 1962 the nonaligned nations played a prominent role at an international disarmament conference for the first time; their participation, however, failed to bridge the gap between the East and West on the crucial disarmament question.

A principal stumbling block to reaching agreement on disarmament has been the much-discussed issue of international controls for enforcing arms reduction measures. The Soviet Union has repeatedly rejected Western proposals for international verification of a disarmament accord, allegedly because such controls might be used for espionage purposes. The United States, on the other hand, has refused to endorse disarmament proposals which did not include adequate international safeguards. Neither nation compromised its basic position on the issue in the disarmament negotiations discussed below.

Seventeen-Nation Disarmament Conference.—The UN Disarmament Committee held negotiations in Geneva during 1962 (from March 14 to June 14, July 16 to September 7, and November 26 to December 20), but failed to break the East-West deadlock on ways and means to achieve world disarmament and arms control. The committee is composed of five Western nations (Canada, France, Great Britain, Italy, and the United States); five Soviet-bloc countries (Bulgaria, Czechoslovakia, Poland, Rumania, and the Soviet Union); and eight nonaligned nations (Brazil, Burma, Ethiopia, India, Mexico, Nigeria, Sweden, and the United Arab Republic). France alone refused to take part in the Geneva disarmament conference.

A principal reason for the failure of the conference was the Soviet Union's refusal to permit international inspection of proposed disarmament measures on its territory, and the rejection by the United States of disarmament plans that did not allow for inspection safeguards or adequate controls. Proposals considered at the conference were eventually rejected by either the Eastern or Western powers chiefly for this reason.

Soviet Delegate Semyon K. Tsarapkin, on March 15, submitted a plan for "general and complete disarmament" without specific control measures. He later rejected Western demands for the establishment on Soviet territory of international control posts to be manned by foreign inspectors, offering instead to set up national control posts operated by Soviet citizens, with foreign inspectors to be allowed into the Soviet Union only by invitation of the Soviet government.

Arthur H. Dean, chief United States delegate (who resigned on Jan. 4, 1963), submitted another plan for reduction of armaments that required thorough verification by means of international inspection. (The proposal was a detailed version of a comprehensive plan first presented by President Kennedy to the UN General Assembly on Sept. 25, 1961.) Subsequent United States proposals also insisted on adequate controls to make certain that disarmament would actually be carried out.

Although the Soviet Union and the United States later submitted so-called compromise proposals allegedly intended to bring their respective positions on disarmament closer together, none of the proposals was deemed acceptable by the other. Soviet proposals for an uncontrolled moratorium on underground nuclear tests, an unpoliced ban on atmospheric nuclear testing, the withdrawal of foreign military bases in the first stage of disarmament, and the abolishment of joint national military exercises, were rejected by the Western nations. Western proposals turned down by the Soviets included a plan providing for progressive inspections by territorial zones to verify disarmament measures, a reduction from 180 to about 80 in the number of proposed control posts comprising an international monitoring network under a nuclear test-ban treaty, a system of national control posts under international inspection, and alternative suggestions for either a total ban on nuclear testing with international on-site inspections, or an uninspected limited ban on atmospheric and underwater nuclear tests.

The only agreement announced at the conference was the committee's approval on May 25 of a joint six-point declaration condemning war propaganda, but even this peripheral agreement was later renounced by the Soviet, who, five days after apparently accepting the declaration, proposed amendments which were unacceptable to the Western delegates.

Efforts by the nonaligned nations at the conference to offer disarmament proposals acceptable to both East and West also failed. A nuclear test-ban proposal presented (April 16) by Brazil on behalf of the eight neutral members was judged by the West to be inadequate in providing for enforceable controls. Suggestions by India, Mexico, and Sweden for the temporary cessation of underground nuclear tests was rejected by the Soviet Union on December 3. Another neutralist proposal for an immediate ban on atmospheric and underwater nuclear testing was supported only by Italy among the Western members.

The conference on September 7 adopted a report which described the negotiations as having made "no progress." The Disarmament Committee adjourned its meetings on Dec. 20, 1962. Negotiations were scheduled to be resumed in Geneva in early 1963. (See also UNITED NATIONS.)

Three-Power Talks to Ban Nuclear Testing.—The three-power Conference on the Discontinuance of Nuclear Weapons Tests ended in failure on Jan. 29, 1962, after 353 meetings were held in Geneva over a 39-month period (begun Oct. 31, 1958). Great Britain and the United States withdrew from the conference as a result of the Soviet Union's persistent refusal to accept the monitoring of a nuclear test-ban treaty by means of an international control system. The Soviet Union accused the Western powers of "wrecking" the conference and of wanting international controls for the sole purpose of conducting espionage.

Negotiations on banning nuclear tests were re-

sumed at Geneva on September 14 by the three powers, who met as a subcommittee of the UN Disarmament Committee while the 17-nation conference was in recess. The conferees again failed to agree on the question of international verification for a test-ban treaty. Further three-power negotiations held late in the year during a session of the parent conference also remained deadlocked. Among proposals discussed was the possible use of robot seismic stations to detect underground nuclear explosions.

U.S. Arms Control and Disarmament Agency.—The agency completed its first year of operation on Sept. 26, 1962, as a policymaking body empowered to conduct technical studies on disarmament, recommend disarmament policies to the president, and hold negotiations on disarmament with other nations. William C. Foster has served as director of the agency since its formation. Jacob D. Beam, a career Foreign Service officer, was named assistant director on January 29. The agency's General Advisory Committee, consisting of 15 prominent citizens, was appointed by President Kennedy and was sworn in on April 2. Henry A. Byroade, former Army brigadier general and United States diplomat, was named chairman of the committee.

DISCIPLES OF CHRIST

This faith in 1962 had a world total of 2,011,352 members, of whom 1,797,466 were in the United States. Worldwide membership was organized in 8,915 congregations. There were 222 missionaries and over 2,000 national leaders serving in 13 fields. Church contributions for missionary, educational, and benevolent causes totaled $13,834,129. The amount contributed in 1962 for all work, local and overseas, was $86,117,222. Unified Promotion, the central receiving agency for missionary funds, received $8,418,999.91. The Pension Fund reported total assets of $39,866,645.31.

The 1962 Assembly of the International Convention of Christian Churches (Disciples of Christ) was held in Los Angeles, Calif., September 30–October 4. The 1963 assembly will be held in Miami Beach, Fla., with President Robert W. Burns of Atlanta, Ga., presiding.

Baptisms in the United States and Canada totaled 46,314, with transfers of 55,399, bringing the total additions to 101,713.

Ecumenical concerns were expressed through the annual offering of the Week of Compassion, which in 1962 totaled $577,321.81. This fund was distributed for relief, rehabilitation and educational services of the World Council of Churches and the National Council of Churches.

The Disciples of Christ, with headquarters at 221 Ohmer Avenue, Indianapolis, Ind., publish *World Call,* a monthly, and *The Christian,* a weekly.

DISTILLING INDUSTRY

The production of distilled spirits at distilled spirits plants in the United States during the fiscal year ended June 30, 1962, as compared with audited figures for the fiscal year 1961, was as follows, in tax gallons:[1]

	July 1, 1961—June 30, 1962	July 1, 1960—June 30, 1961
Whiskey	136,000,404	138,731,346
Brandy	7,548,382	8,102,784
Rum	1,743,779	1,706,406
Gin	20,667,009	18,329,309
Vodka	9,940,095	9,422,868
Alcohol and spirits:		
190° and over	604,254,667	603,674,220
Under 190°	29,363,249	21,831,943
Total	809,517,585	801,798,876

[1] As used herein, a tax or proof gallon is a standard United States gallon of 231 cubic inches containing 50% of ethyl alcohol by volume; a wine gallon is a standard United States gallon regardless of proof.

Rectified Spirits.—In the fiscal year 1962 (1961 figures in parentheses), rectifying plants used 86,638,547 proof gallons (85,825,420) of domestic and imported liquors, and production by rectification amounted to 85,238,609 proof gallons (84,312,251). Whiskey accounted for 63,717,970 gallons of the total production by rectification (64,517,787).

Output for Consumption.—During the calendar year 1961 the bottled output of domestic distilled spirits, plus imported spirits bottled after withdrawal from customs warehouses, totaled 211,019,255 wine gallons, as compared with 203,301,932 during 1960, an increase of 3.8%. Whiskey bottled during 1961 amounted to 147,280,297 wine gallons, accounting for 69.7% of total distilled spirits bottled, as against 145,113,629 gallons during 1960, or 71.3% of total spirits. Of the total whiskey bottled during 1961, spirit blends amounted to 73,059,961 gallons; bonded, 8,910,587; straight, 64,412,283; and blended straights, 897,466. The remainder of the bottled output consisted of gin, 23,599,827 gallons; rum (bottled in continental United States and not including rum imported from Puerto Rico), 903,906; brandy, 5,754,379; vodka, 20,964,980; cordials, liqueurs, and similar products, 10,080,736; and miscellaneous (including products bottled for exportation), 2,435,130.

Withdrawals.—Tax-paid and tax-free withdrawals (in tax gallons) during the fiscal year 1962, compared with 1961, were as follows:

	July 1, 1961—June 30, 1962	July 1, 1960—June 30, 1961
Tax-paid withdrawals:		
Whiskey, total	85,185,145	83,373,506
Whiskey, bottled in bond[1]	8,776,583	8,966,232
Brandy	5,651,462	5,135,820
Rum	209,839	190,748
Gin	20,847,774	18,362,971
Vodka	9,978,268	9,463,435
Alcohol and spirits:		
190° and over	50,901,790	56,804,726
Under 190°	11,221,609	4,260,984
Total	183,995,887	177,592,190
Tax-free withdrawals:		
For addition to wines:		
Brandy	1,026,596	1,155,985
Spirits	31,821,199	31,538,917
For export:		
Whiskey only	930,311	995,165
Other distilled spirits	367,840	11,641,060
Transfers to customs manufacturing bonded warehouses:		
Whiskey only	308,137	222,928
Other distilled spirits	491,106	361,451
For vessels and aircraft	4,439	2,751
To foreign-trade zones	20,277	1,615
For use of the United States	1,155,076	853,365
Alcohol for hospital, scientific, and educational use	2,942,055	2,892,462
Alcohol for medical, beverage, and other purposes in Puerto Rico	56,249	76,688
Used for denaturation:		
Alcohol	511,890,385	537,709,024
Rum	1,512,364	1,436,199
Total tax-free withdrawals	552,526,034	588,887,610

[1] Included in "Whiskey, total."

Apparent Consumption.—The apparent consumption of distilled spirits in the United States during the calendar year 1961, as compiled by the Distilled Spirits Institute, amounted to 241,449,065 wine gallons, an increase of 2.9% compared with 1960. These figures are based on actual wholesale and retail sales in the control states, and on tax collections or gallonage shipments to wholesalers in the license states. Consumption amounted to 182,706,861 gallons in the license states, or 75.7% of the total, and 58,742,204 gallons in the control states, or 24.3% of the total.

Revenues.—Revenues accruing to the federal government from distilled spirits during the calendar year 1961 amounted to $2,422,058,000, an increase of 4.2% compared with 1960. This amount accounted for 72.5% of federal collections from alcoholic beverages, which totaled $3,339,282,000. Taxes on beer accounted for 24.3% of the total alcoholic beverage receipts, and wine accounted for 3.2%. The federal excise tax rate on distilled spirits was $10.50 per proof gallon.

Imports.—United States dutiable imports of distilled spirits during the calendar year 1961 amounted to 39,101,246 tax gallons, with whiskey comprising 34,454,065 gallons of the total. In addition, 3,378,525 gallons of spirits were received from Puerto Rico and the Virgin Islands.

Exports.—In 1961, exports of distilled spirits from the United States to foreign destinations (exclusive of military shipments) amounted to 1,518,068 proof gallons. In addition, 279,277 gallons were shipped to Puerto Rico, the Virgin Islands, and Guam.

Distillers' Dried Grains.—Production of distillers' dried grains at all distilled spirits plants during 1961 consisted of 290,000 tons of dark grains, 30,600 tons of light grains, and 61,000 tons of dried solubles, or a total of 381,600 tons.

ROBERT W. COYNE,
President, Distilled Spirits Institute, Inc.

DISTRICT OF COLUMBIA

This Federal District of the United States, comprising an urban area of 69 square miles (land, 61; water, 8), is coextensive with the city of Washington, the national capital. Population of the District proper on July 1, 1962, totaled 784,000, a rise of 2.6% from the 1960 census figure of 763,956. For the metropolitan area of which the District is the center, the population (1960 census) was 2,001,897.

Government.—Administration is conducted by a three-member Board of Commissioners, two of whom are civilians appointed by the president of the United States with the consent of the Senate, and the third, a member of the U.S. Army Corps of Engineers. Commissioners in 1962 were: Walter N. Tobriner, president; John B. Duncan; and Brig. Gen. Frederick J. Clarke. Secretary of the board was G. M. Thornett, and superintendent of schools, Dr. Carl F. Hansen.

The U.S. Congress enacts District legislation, usually after consultation with the commissioners. Judicial functions are under a federal Court of Appeals, a federal District Court, a municipal Court of Appeals, a Municipal Court (after Dec. 31, 1962, the Court of General Sessions), and a Juvenile Court.

Finance.—In the 1962 fiscal year, revenue of $289,394,678 included $183,776,007 from District taxes and $66,899,530 in federal funds. Chief tax yields were general sales tax ($25,695,097), individual income taxes ($27,888,036), and motor fuel taxes ($12,016,710). Spending of $324,402,414 included $64,059,688 for education, $133,297,823 for health, welfare, and safety, and $57,421,363 for highways.

Transportation and Communications.—With 64.94 miles of District highway construction and reconstruction completed in the fiscal year 1962, *highways and roads* on June 30, 1962, totaled 1,295 miles (1,284 surfaced). These served 216,454 *motor vehicles* (as registered on March 1, 1962), including 162,794 automobiles. Operating in the District in 1962 were 8 *railroads* (using 41 line miles of track) and 12 regularly scheduled *airlines*. There was one commercial *airport*.

Communications media included (1962) 17 AM and 12 FM *radio stations;* 4 VHF and 2 UHF *television stations;* 3 daily *newspapers* (circulation, 663,422) and 11 other newspapers (75,000); and (January 1) 315,500 business and 346,400 residential *telephones*.

Education.—In the 1961–62 school year, public elementary schools staffed by 2,649 teachers enrolled 83,733 pupils; junior high schools with 1,106 teachers enrolled 26,866; senior high schools with 606 teachers enrolled 12,973; private and parochial schools enrolled 16,450. Enrollment in the District's colleges and universities totaled 46,895.

Public school spending in the 1961–62 school year for current operations totaled $54,189,756 ($461.53 per pupil), including capital outlay of $5,795,400. Revenue comprised $53,758,412 from school districts and $431,344 in federal funds. Teachers' salaries averaged $6,390 (senior high, $7,036; vocational, $6,874; junior high, $6,353; elementary, $6,203).

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 32,864 persons totaled $15,809,329. This amount included $9,878,726 for dependent children and $2,015,344 for the aged.

Labor Force.—The Bureau of Labor Statistics reported 257,400 federal employees in the District in August 1962. Nongovernmental employees covered by the District Unemployment Act averaged 235,597 in 1961 and received $1,153,246,000 in wages, an increase of 5.2% over the 1960 total. Covered federal government employees averaged 206,064 and received $1,418,417,207 in 1961, up 6.3% from 1960; and covered District government employees averaged 25,692 and received $149,716,353 in 1961, up 10.3% from 1960. Average covered employment and wages in major nongovernment categories were: trade, 82,958 workers ($367,912,843); service industries, 61,844 ($287,877,365); transportation, communications, utilities, and sanitary services, 22,969 ($137,979,542); and manufacturing, 19,776 ($124,657,424).

Events, 1962.—The capital's dynamic building program made further progress in 1962. On May 24, President Kennedy laid the cornerstone for the $75 million Sam Rayburn House Office Building, one of several new office buildings springing up throughout the city. At midyear, the federal government had $100 million in office building construction under way. In addition, each of the six major universities in the downtown area were adding new facilities, and a number of new hotels and motels were completed or under construction.

The Smithsonian Institution (q.v.) was erecting a unique Museum of History and Technology, a $36 million structure which was scheduled to open in 1963. Elsewhere in the Greater Washington area, a planetarium, a science center, and a space, aviation, and communications center were projected.

The $110 million John Foster Dulles International Airport at Chantilly, Va., built by the Federal Aviation Agency from an Eero Saarinen design, was dedicated by President Kennedy on November 17 and began operations two days later. (See also Aeronautics.) A mass-transit study group established by Congress issued a report in November on a proposed 10-year construction program beginning in 1964. The $1,619,000,000 project would include 2 subway routes, 8 rail lines, 50 miles of new freeway, and increased bus service.

Simplified plans for the National Cultural Center, designed by Edward Stone, were unveiled on September 11. The $30 million white marble structure, to be erected on the east bank of the Potomac, will house a theater, a symphony hall, and an auditorium for opera, ballet, and musical comedy. Announcement was also made of plans for a Washington Gallery of Modern Art.

On February 14, national interest was centered on the District, and the White House in particular, when Mrs. John F. Kennedy conducted a televised tour of the presidential mansion. The first lady commented on the restoration and renovation of many of the rooms. In keeping with the renewed historic awareness in Washington, many original buildings in Lafayette Square, which had been scheduled for demolition, were retained. Intervention by Mrs. Kennedy was credited with preserving the early homes.

The city was host to the first International Jazz Festival from May 31 to June 3. Sponsored by the President's Music Committee of the People-to-People Program, the festival presented artists from Belgium, England, France, Germany, Iceland, New Zealand, and Sweden, as well as many American jazz virtuosos.

DOMINICA. See West Indies Federation.

DOMINICAN REPUBLIC

Comprising the eastern two thirds of the Caribbean island of Hispaniola, the Dominican Republic has an area of 18,816 square miles, and a population (July 1, 1961 est.) of 3,098,000, mostly of mixed European, Negro, and Indian descent. The population, about 30% of which is urban, has shown a growth rate of 3.5% over the last decade. Principal cities and populations (1960 census): Santo Domingo (called Ciudad Trujillo from 1936 to 1961), the capital, 367,063; Santiago de los Caballeros, 83,523; and San Francisco de Macorís, 26,000. Spanish is the official language.

Government.—Pending the adoption of a new constitution and the holding of a national election, the government was in the hands of a 7-member Council of State, headed by a president. On Jan. 18, 1962, Rafael Bonnelly, the vice president, replaced Joaquin Balaguer, who had been elected president on Aug. 4, 1960. National elections were held on Dec. 20, 1962, and Juan Bosch (Revolutionary Party) was elected president. (See below, *Events, 1962.*)

Education and Religion.—School enrollment, 1960: 816,813 (about 56% of the school-age population). Number of schools: 4,463 primary; 76 secondary; 487 normal, vocational, and special; 1 higher. Illiteracy among persons over 15 years of age dropped from 43.5% in 1935 to 30% in 1960. State religion: Roman Catholicism; other forms of religion are permitted.

Finance.—Government revenue, 1962 est.: 126,990,087 pesos (129,225,845 in 1961); expenditure, 125,990,087 (128,258,494 in 1961). The Dominican peso is equal to the United States dollar. In February 1962 the United States granted a $25 million loan to the Dominican Republic through the Agency for International Development, under the Alliance for Progress.

Transportation and Communications.—Transport networks (miles, 1960): roads, 2,990 (about one half paved); railroads, 1,100 (privately owned, serving mainly the sugar plantations). Air services are provided by Compañia Dominicana de Aviacion (CDA) and four foreign airlines. Other communications data (1960): passenger cars, 11,000; commercial vehicles, 6,300; telephones, 20,315; radios, 98,000 (1959); television sets, 15,000; radio stations, 63; television stations, 4; newspapers, 4 (1962).

Agriculture.—About 56% of the labor force is engaged in agriculture. The principal cash crops are sugar, coffee, cacao, and tobacco. Agricultural yield (metric tons, 1960); sugar, 1,112,000; rice, 119,500; corn, 100,600; tapioca, 105,776; sweet potatoes, 75,500; peanuts, 61,683; coffee, 35,400; cacao, 34,300; tobacco, 22,500. In 1961 the income from sugar exports declined, with indications of graver difficulties in 1962 (see below *Events, 1962*).

Manufactures and Minerals.—Chief industrial products, 1960: cement, 170,000 metric tons; cigars, 30 million; cigarettes, 826 million; lumber (sawn), 10,000 cubic meters; footwear, 475,000 pairs. Chief minerals (metric tons, 1960): iron ore, 82,000; salt, 85,800; bauxite, 668,621. Output of electrical power in 1960 reached 348,511,000 kw.-hr. Manufacturing establishments numbered 2,801 in 1960 and employed 81,785 persons; total sales in 1960 were 262,839,422 pesos.

(Near left) **Juan Bosch *(top)* of the Revolutionary Party, elected president on December 20. The closest contender was Viriato Fiallo of National Civic Union *(bottom)*.**

Foreign Trade.—Total exports, 1961: $143.1 million ($180.4 million in 1960); imports, $69.5 million ($87 million in 1960). Principal exports, 1961: sugar, $69.6 million; cacao, $14.7 million; coffee, $13.8 million; tobacco, $9.5 million. Principal imports: textiles, chemicals and pharmaceuticals, fuels and petroleum products, foodstuffs. Exports to the United States totaled $90.1 million, down about 17% from 1960; imports totaled $29.4 million, about 27% below 1960. Other major trading partners were West Germany, Japan, Netherlands, and Great Britain.

Events, 1962.—The Dominican people moved shakily into 1962 after a chaotic 1961. The assassination of the long-time dictator, Rafael Leonidas Trujillo Molina on May 30, 1961, set off a continuous series of political plots, coups, and countercoups as the Trujillo family battled hostile internal groups which in turn fought each other. The United States had made it clear that return of the Trujillos to power would not be acceptable, and backed up its stand by sending a naval task force to Dominican waters in November 1961.

By the middle of January 1962 it seemed unlikely that the Trujillo family would return as a dominant force in Dominican politics. The political party organization of the Trujillos had been dissolved, and a Council of State, including among its members persons from the Trujillo opposition, the National Civic Union, had been created to make the key legislative and executive decisions. Dates for election of a constituent assembly and general elections had been set for August and December, 1962.

One of the first actions of the Council of State, after being sworn in on Jan. 1, 1962, was to decree seizure of all property of the Trujillo family as of January 5. An autonomous National Industrial Development Corporation was formed to administer and dispose of the confiscated properties. Meanwhile, on January 4 the Organization of American States voted to lift the economic and diplomatic sanctions in force against the Dominican Republic since August 1960. On January 6 the United States resumed diplomatic relations (severed in August 1960); Haiti followed suit, as did other Latin American countries.

President Joaquin Balaguer, who had weathered a number of political storms to become temporary head of the Council of State in December 1961, was removed by an army coup on January 16, led by Gen. Pedro Rodriguez y Echavarria, who attempted to install a new military-civilian government. Fearing an effort to create a military dictatorship, the United States quickly opposed the coup and implied that it would impose diplomatic and economic sanctions. On January 18 a countercoup by the air force overthrew the Rodriguez y Echavarria junta and the Council of State was restored, with Vice President Rafael Bonnelly as president.

The new governing arrangement looked promising enough from the United States point of view to warrant a favorable statement from President Kennedy and a $25 million credit, effective February 16, for the dual purpose of alleviating Dominican balance of payments difficulties and promoting economic development. Moreover, on January 29, the United States lifted import restrictions on Dominican goods that were imposed during 1960–61 and proposed returning to the Dominican Republic $22,755,153 that had been collected in import fees on sugar as an economic sanction against the Trujillo regime. President Kennedy named John B. Martin as United States ambassador on February 17, and Rafael Pico on February 21 to assist the Dominican government in economic planning. On March 8 a military pact was signed to provide United States assistance in the reorganization of the Dominican armed forces.

Political unrest continued, however. The Council of State decreed a "state of emergency" in February to combat activities of conspirators and agitators at both extremes of the political spectrum. Arson and other destructive activities increased, bringing the arrest of five leftist leaders. Rightist influence was evident in the rioting of March 8, the day before Ambassador Martin presented his credentials to President Bonnelly and the Council of State. About 1,000 persons demonstrated against the forced exile of ex-President Balaguer and ex-armed forces chief Rodriguez y Echavarria. Shops were looted, the United States embassy was attacked, and the car of the United States ambassador was burned. Police arrested 100 persons.

Early in the year, a National Planning Board was created to prepare and supervise economic and social development programs. By May the government had legislated to provide for an agrarian reform program involving redistribution of land, along with related programs for housing, loans to farmers, and technical assistance to promote a higher level of productivity in agriculture. These programs were to be accompanied by a

general effort toward greater crop diversification and correspondingly less dependence on sugar as the key export crop and principal source of convertible foreign currency. On July 6, President Kennedy announced that the United States would establish a fund to help diversify the economy of the Dominican Republic.

Difficulties arose in June and July when proposed retroactive payments of premium prices for nonquota Dominican sugar which had entered the United States between September 1960 and March 1961 were nullified by action of a U.S. Senate-House conference committee on June 28–29. Moreover, the Congress took action to cut the existing Dominican quota at premium prices to about one fourth of the existing amount. (The premium price was about $108 a ton against the world market price of about $56 a ton.) Under the Sugar Act, the Dominican Republic received a quota of 95,000 tons for the period July–December 1962, as opposed to 476,000 for the first half of the year. Realizing that the new quota would cancel out the $25 million credit allowed under the Alliance for Progress in February, the Council of State announced that it would suspend all development programs begun in connection with commitments from the Alliance for Progress. On July 12, President Kennedy allotted to the Dominican Republic an additional sugar quota of 130,000 tons from the Cuban quota.

Rioting occurred in Santo Domingo on July 6, and the Council of State announced that the elections scheduled for August 15 for the constituent assembly to frame a new constitution would be delayed indefinitely. Instead, on September 16 a new constitution was proclaimed by President Bonnelly. The new constitution is basically the one used during the Trujillo regime, with several amendments on procedures for the election of the president and Congress.

The first free elections to be held in the Dominican Republic since 1924 took place on December 20. Voters turned out in large numbers and balloting was surprising orderly. Juan Bosch, candidate of the Revolutionary Party, was elected president for a four-year term, defeating Viriato D. Fiallo of the National Civic Union. Both men were considered pro-United States, and both advocated land reform measures, but Bosch's reform proposals were regarded as the more liberal.

Efforts to aid the Dominican Republic continued as the United States government sought Peace Corps volunteers for assignments on the island, and a private American development firm contracted with the Dominican government to aid in administration and distribution of the land which the government had taken from the Trujillos.

DRUGS

The United States drug industry's outlay for research and development increased by 13% in 1961 to a record $245.3 million. For 1962, the Pharmaceutical Manufacturers Association expected research expenditures to reach another new high of about $268 million. Funds allocated for this purpose by drug manufacturers constituted 8% of 1961 sales, while industry in general spends about 3% of its sales income for research.

Pharmaceutical sales at the manufacturer's level increased to $2.643 billion in 1961 from $2.501 billion in 1959 and $2.588 in 1960, according to the *1961 Annual Survey of Manufactures*, U.S. Department of Commerce. Over three fourths of sales was accounted for by prescription or ethical products, and the remainder by proprietary products.

The pace of new drug product introductions slackened in 1961, falling to 265 from 311 a year earlier. Declining more moderately, however, was the introduction of new chemical entities. These totaled 41 in 1961 and 45 in 1960.

The production of synthetic medicinal chemicals continued to rise. The U.S. Tariff Commission estimated that production amounted to 117.4 million pounds in 1961, up from 113.8 million pounds the previous year. Aspirin production declined, however, to 22.7 million pounds in 1961 from 23.6 million pounds in 1960. Increasing sharply was the production of penicillin salts, from 498.1 trillion international units in 1960 to an estimated 648.6 trillion IU in 1961.

The U.S. Bureau of Labor Statistics reported that as of May 1962, 108,800 persons were engaged in the manufacture of drugs and medicinal agents. During 1961, the drug industry employed 13,500 research scientists and supporting staff members, an increase of 9% over the year before.

Some 58,800 members of the drug industry work force were classified as production or nonsupervisory employees. As of May 1962 the average workweek of the industry's production workers was 40.8 hours, with average weekly gross earnings of $98.33.

Modern Medicine estimates that in 1962, sales of ethical drug products were distributed as follows: pre-

(*Left*) Crowd in Santo Domingo celebrates countercoup on January 18 which overthrew military junta after two-day rule and restored Council of State to power. (*Right*) Car of U.S. Ambassador John B. UPI

scriptions, 60.5%; hospitals, 20.9%; and physicians, 18.6%. It also estimates that the following seven categories of drugs were prescribed most often in 1962: antibiotics, 13.9% of all prescriptions; cough and cold preparations, 8.4%; analgesics, 8.2%; ataractics, 7.2%; hormones, 7.1%; sedatives and hypnotics, 6.6%; and cardiovascular preparations, 6.0%. The balance of prescriptions filled were distributed among over 35 other therapeutic classifications.

Drug Topics reports that in 1961, sales of the 54,116 drug stores in the United States amounted to $7,984,000,000, an increase of 3.5% over 1960. The dollar volume of prescriptions in 1961 was $2,208,940,000, as compared with $2,175,360,000 the year before; the retail value of all nonprescription packaged medication sold in all outlets increased by 3.2% to a new high of $1.8 billion in 1961.

The number of prescriptions filled by drugstores in 1961 rose to a new high of 742.7 million from 729.2 million in 1960. (These figures cover 98% of all prescriptions filled in the United States.) Noteworthy was the reduction in 1961 in the average expenditure for a prescription (by 0.3%, to $2.97 from $2.98 the year before) for the first time in over 20 years.

ECUADOR

The "Republic of the Equator," situated on the west coast of South America, has an area of approximately 105,000 square miles and a population of 4,650,000 (1962 est.), including 2,020,000 in the coastal region and 2,570,000 in the highlands. The Galápagos Islands, some 600 miles off the coast in the Pacific, have an area of 3,123 square miles and a population of 1,790 (1959). Principal cities and populations (1959 est.): Quito, the capital, 402,000; Guayaquil, 610,000; Cuenca, 62,000; Ambato, 42,000; Riobamba, 40,000; Latacunga, 32,000. Spanish is the official language.

Government.—Ecuador is a unitary state, with a representative government based on a separation of powers. The National Congress consists of a Chamber of Deputies (73 members elected for 2-year terms) and a Senate (47 members elected for 4-year terms, 35 on a territorial basis and 12 on a functional basis, representing public education, Catholic education, the armed forces, journalism and scientific and literary academies, agriculture, business, labor, and industry). (See also below, *Events, 1962.*) The president (Carlos Julio Arosemena Monroy, vice president until Nov. 8, 1961, when Velasco Ibarra was driven into exile by the army) is, according to the 1946 constitution, elected for a 4-year term. There is a Supreme Court, an autonomous Court of Elections, and a Council of State with legislative and judicial powers.

Education and Religion.—School enrollment, 1961: 587,543 (Loja and Manabí provinces not reported). Number of schools (with enrollments), 1961: 101 kindergarten (11,742); 5,748 elementary (596,268); 324 secondary (69,791); 10 institutions of higher learning (9,342). Only 14% of the primary students enrolled were expected to finish 6th grade; some 200,000 children (ages 6–12) were not in school in 1962. Teachers receive typically 800 sucres ($44) monthly. The constitution proclaims religious freedom but Roman Catholicism is the dominant religion.

Finance.—The 1962 budget called for a balance of revenue and expenditure at 2,048 million sucres (1,770 in 1961), including capital expenditures of 420.2 million and 331.5 million for public enterprises. Ordinary expenditures included: servicing the public debt, 292.4 million; education, 276.6 million; armed forces, 267 million. Public debt: 791.8 million sucres at the end of 1961; foreign debt, $111.8 million. The sucre was valued at U.S.$0.055 at the official exchange rate and at U.S.$0.044 on the free market (November 1962). Gold and foreign exchange reserves: $36.9 million as of August 1962.

Transportation and Communications.—Transport networks (miles, 1960): railways, 696; all-weather roads, 3,400 (206 paved). Seaports: Guayaquil (handles 90% of imports and 60% of exports) and 9 others. International jet airports: Quito and Guayaquil. Motor vehicles: 23,000 (1959); telephones, 29,100 (1961), including 10,232 in Guayaquil and 8,000 in Quito; radio receivers, 120,000 (1958); television sets, 5,000 (1962).

Economic Indicators.—Gross national product: 13,627 million sucres in 1960. Cost-of-living index (1958 = 100): 109 as of August 1962. Labor force (1960): 1,654,300, including 878,500 in agriculture and fishing, 320,900 in manufacturing, and 38,000 in transportation.

Manufactures and Minerals.—Chief products (metric tons, 1961): crude petroleum, 387,600 (up 7% from 1960); cement, 219,600 (up 9%); gold, 15,159 fine ounces (1960); silver, 126,419 troy ounces (1960).

Agriculture and Fishing.—Chief crops (metric tons, 1961): bananas, 2,050,425; potatoes, 199,641; cacao, 43,000; rice, 169,150; corn, 159,510; barley, 84,610; wheat, 77,630; coffee, 30,420; beans, 10,297; cotton, 6,436. Total shrimp catch: 14.9 million pounds.

Foreign Trade.—Total exports, 1961: $126.9 million ($144.5 million in 1960); imports, $100.8 million ($100.3 million in 1960). Principal exports (in millions of dollars, 1961): bananas, 80.6; cacao, 15.6; coffee, 14.3; rice, 2.7; shrimp, 1.7. Chief banana customers (with percentage of total exports received, 1961): United States (64%); West Germany (18.7%); Belgium (8.6%); Chile (4.7%). Ecuador's share of the former Cuban preferential sugar quota in the United States market is 30,000 tons.

Events, 1962.—In March, pressure mounted in military circles and from all but extreme-left political parties for a stand against Communist Cuba. President Arosemena proposed a national plebiscite to determine the issue "democratically." Anti-Communist demonstrations turned into riots; the Conservative Party withdrew from the government coalition; and the Christian Social Movement threatened to go over to the opposition. Arosemena charged that his opponents feared the result if the people were actually consulted.

Representatives of the National Democratic Front (FDN), a coalition of the Liberal Party, the Democratic Socialist Party, and the Democratic Union of Independents, offered to join the government if Arosemena would abandon the plebiscite, break relations with countries denying human rights, take military officers out of nonmilitary posts, and place 5 FDN members in his cabinet. The proposition was accepted, ending Arosemena's dream of building new markets in the Soviet bloc. On April 3 the new cabinet voted to break with Cuba, Poland, and Czechoslovakia.

The government was plagued during the year by strikes and violent demonstrations of dissatisfaction. The promised major social and economic reforms (ostensibly the reason for forcing Velasco Ibarra from the presidency) had not taken place. On the far left the Revolutionary Union of Ecuadorian Youth (URJE) denounced the ineffectiveness of the regime, while the Revolutionary Socialist Party called for a Castro-type transformation of Ecuador. On the far right the Catholic Church and the Ecuadorian Nationalist Revolutionary Action (a Falangist-type organization) insisted that communism had virtually taken over. Arosemena defended the members of his administration as moderate leftists and progressive Catholics. A hotly debated motion in Congress for his impeachment was rejected in September by a vote of 64–33.

The complex bill for agrarian reform, proposing, among other things, abolition of the estimated 90,000 *huasipungo* tenancies,[1] was not enacted by Congress. Attempts to take an agrarian census, to serve as a basis for land reform, were suspended in April after Indians reacted with hostility toward school teachers and priests employed in the task. Many rural schools were closed and 13 persons were killed and 50 injured. A well-armed training camp for youthful guerrillas was broken up in March; many of those arrested had been schooled at the University of Havana and had come back to help start "the Revolution." In July, eight paratroopers were imprisoned for providing weapons to the Castro-inspired URJE and for defecting to organize guerrillas.

The congressional and municipal elections of June 3 (with over 15 million voters registered) showed a swing away from the left. Results in the Chamber of Deputies: Conservatives, 24 seats; independents, 18; National Democratic Front, 17; Confederation of Popular Forces, 5; Velasquistas, 3; Christian Social Movement, 3. Conservatives won 7 out of 15 mayorships.

The Central Bank's credit operations, the heavy outflow of foreign exchange, the 1961 currency devaluation, an ambitious public works program, and spending by semiautonomous development agencies contributed to the financial embarrassment of the public treasury in early 1962. The total deficit for 1961 had been 416 million sucres; revelations were made of unauthorized expenditures (56 million sucres in the Office of the Presidency alone) and graft in the previous administration; and scandal broke over corruption and incompetence in the administration of Guayaquil. A number of the austerity steps taken to consolidate and control the fiscal system depressed economic activity until the seasonal upswing in September.

Foreign loans approved in 1962 included $10.6 million for low-cost housing and $3 million toward renovation of the Quito sewerage system from the Inter-American Development Bank (IADB), $5 million for industrial development and $8 million to cover the 1961 budget deficit from the Agency for International Development (AID), and 22.6 million sucres from the Alliance for Progress, chiefly for agricultural development, research, irrigation, and the eradication of disease.

ROBERT D. HAYTON,
Chairman, Inter-American Affairs Center, Hunter College (City University of New York).

[1] These require the farmer to pay a "rent" for his small plot of a minimum of 4 days' work for the landlord per week.

EDUCATION

Some progress toward ending racial segregation in public schools continued to be made in 1962 in the South and elsewhere, but the enrollment of the first Negro at the University of Mississippi provoked the gravest conflict between federal and state authority since the Civil War.

Crisis in Mississippi.—James H. Meredith, a 29-year-old Negro and Air Force veteran, had begun his long effort to enter the University of Mississippi as a transfer student in January 1961. After 18 months of legal maneuvers by Mississippi officials, the U.S. Court of Appeals for the Fifth Circuit ruled on June 25, 1962, that Meredith had been denied admission "solely because he was a Negro," and on July 17 ordered the University of Mississippi to enroll him in September. A series of stay orders obtained by Mississippi officials delayed action until the third order was set aside on September 10 by U.S. Supreme Court Justice Hugo L. Black, and a showdown became imminent.

Mississippi Gov. Ross R. Barnett declared that he would go to jail rather than permit Meredith to enter the university. He obtained authority from the state college board to deal personally with the situation, and took over as special registrar of the university. On two occasions, at Oxford on September 20 and at Jackson on September 25, Governor Barnett personally denied admission to the university to Meredith, who was accompanied by Justice Department aides. A third attempt at registration, at Oxford on September 26, was blocked by Lt. Gov. Paul B. Johnson.

On September 28, Governor Barnett declined to appear before the Court of Appeals in New Orleans to answer charges of civil contempt of federal court orders. Trying him *in absentia*, the court found him guilty but gave him four days to "purge" himself of contempt or face arrest and a fine of $10,000 a day.

President Kennedy intervened in the growing crisis on September 30. At 12:01 A.M. he signed a proclamation commanding the people of Mississippi to end their defiance of federal law. At the same time he pressed the Mississippi National Guard into federal service and dispatched Army units to Memphis, Tenn., on a standby basis. On

(*Above*) Mississippi Gov. Ross Barnett (second from right) confronts James Meredith (left) and denies him admission to University of Mississippi on September 25. (*Below*) Federal marshals guard prisoners arrested on university campus during demonstrations against Meredith on October 1.

WIDE WORLD

the evening of September 30—shortly after Barnett indicated that he would yield to Meredith's enrollment—the president addressed the nation by radio and television and appealed to Mississippians to comply with federal authority.

Meredith had been escorted to the campus that afternoon by a force of 500 United States marshals. Even as the president was speaking, a mob of 2,500 persons began assaulting the marshals guarding the Lyceum. The struggle continued into the night until Mississippi National Guardsmen and Army units arrived to restore order. By morning, some 16,000 federal troops had completely occupied the campus and town, and Meredith was duly registered at 7:30 A.M. with no further resistance. Two men, both bystanders, were killed in the rioting. A bodyguard of United States marshals remained with Meredith on the campus as he began attending classes. (See also MISSISSIPPI.)

Other Integration Developments. *Segregation in the South.*—In September 1962, the public and parochial schools in New Orleans admitted 258 Negroes to 46 previously all-white schools, according to the *Southern School News.* There were no major incidents. In their third year of expanding desegregation, the public schools accepted 104 Negroes, most of them first-graders entering 16 schools newly desegregated. Four other schools had been desegregated previously. Under a directive of Archbishop Joseph Francis Rummel in March 1962, protested vigorously at the time by some school patrons, Catholic elementary and secondary schools in the archdiocese of New Orleans were desegregated. City parochial schools received 136 Negroes into 22 elementary schools and 18 of them into four high schools.

In Georgia, unsuccessful efforts were made by 19 Negro pupils to enroll, on September 4, in the white schools of Albany, scene of much racial tension and mass jailing of demonstrators. In Atlanta, now in its second year of desegregation, 44 Negroes were enrolled quietly in 11 predominantly white public schools. Seventeen Negroes were admitted to six previously all-white parochial schools in the Atlanta archdiocese without major incident.

A total of 1,230 Negro pupils attended classes with whites in 140 schools as the 1962 fall term opened in Virginia. This was more than double the number (536) enrolled in schools with white pupils in the spring of 1962. Sixty-five schools were desegregated for the first time. In Virginia's Prince Edward County the public schools remained closed. On July 26, 1962, Federal District Judge Oren R. Lewis declared that the public schools of the county cannot be closed to avoid desegregation while schools elsewhere in Virginia remain open. Legal maneuvers have delayed an effective date for the enforcement of the order. As of December 1962, the public schools were still closed. Leading newspapers in the state have urged reopening, and national magazines have portrayed graphically the situation of the approximately 1,400 Negro children without schooling. In the meantime, 1,325 white children were attending classes set up by the Prince Edward School Foundation in churches, public halls, and a newly constructed $256,000 private high school.

In the fall of 1962, 75 additional school districts in the South were desegregated, making a total of 972 out of 3,058 districts containing both Negro and white pupils. In the 1962–63 school year, a total of 255,367 Negroes (7.8 percent) were attending schools with whites in 17 Southern and border states plus the District of Columbia. Except in the border states and the District of Columbia, however, the number of Negroes actually attending classes with white pupils remains relatively small. The public schools of Alabama, Mississippi, and South Carolina were still completely segregated. So also were the public schools of Georgia and Louisiana, except in Atlanta and New Orleans.

Segregation Outside of the South.—Eight public school districts in Northern and Western states opened the new school session in the fall of 1962 with announced plans to end segregation practices in their classrooms, according to the *Southern School News.* Voluntary desegregation plans were reported by school officials in Eloy, Ariz.; Stamford, Conn.; Mount Vernon, Ill.; Jersey City, Montclair, Morristown, and Newark, N.J.; and Coatesville, Pa.

Negroes in 62 communities in 15 states outside the Southern and border states have filed protests or are investigating discriminatory practices in public schools, according to records kept by the Southern Education Reporting Service. Nineteen court suits have been filed in connection with these protests, and six petitions have been presented to state commissioners of education for quasijudicial proceedings.

School Prayer.—On June 25, 1962, the U.S. Supreme Court, by a vote of 6 to 1, ruled the saying of an official prayer in public schools to be unconstitutional. The historic decision grew out of legal action brought by a group of parents in New Hyde Park, N.Y., where the local school board had "directed the School District's principal to cause the following prayer to be said aloud by each class in the presence of a teacher at the beginning of each school day:

" 'Almighty God, we acknowledge our dependence upon Thee, and we beg Thy blessings upon us, our parents, our teachers, and our country.' " (Quoted from Supreme Court decision, No. 468.)

This daily procedure had been adopted on the recommendation of the State Board of Regents, the governing body of the public schools of New York State. While its use was optional, it was a prescribed prayer, and it was on the latter ground that the Supreme Court based its ruling.

Justice Black, delivering the opinion of the court, maintained that the prayer program officially establishes the beliefs contained in the prayer. "When the power, prestige, and financial support of government is placed behind a particular religious belief," he declared, "the indirect coercive pressure upon religious minorities to conform to the prevailing officially approved religion is plain."

The decision was followed immediately by a wave of protest. Members of Congress proposed constitutional amendments to overturn the ruling; Southern congressmen criticized the Supreme Court; church leaders from various parts of the nation denounced the ruling in terms ranging from "disappointing" to "scandalous." Subsequently, a number of leading Protestant clergymen released an endorsement of the decision. The Washington *Post*, in a strong editorial, hailed the decision as an "act of liberation."

Undoubtedly the decision will have a broad impact on practices in the nation's schools. Some states require that each day's session begin with a recitation of the Lord's Prayer. This would now seem to be unconstitutional; however, the Supreme Court was scheduled to rule specifically on this practice. Also subject to further interpretation is the requirement in many states of the reading of the Bible as a part of the opening exercises.

Teachers' Strike.—On April 11, 1962, a strike of the New York City teachers attracted national attention. On that day, 20,558 public school teachers, or 51.8% of the nearly 40,000 teachers, did not report for duty. An estimated 10,000 teachers picketed some 600 of the city's 850 schools.

The president of the Board of Education warned that the striking teachers were themselves terminating their employment. However, they were back in their classrooms the next morning, for during the early morning hours the executive board of the United Federation of Teachers had called off the strike in the face of a court restraining order obtained by the school board.

While salaries were the chief issue, there were other complaints, particularly about working conditions. The federation, selected by the teachers as their agent in December 1961, had attempted collective bargaining negotiations with the school board. The latter could not act until it had received its budget allocation from the city, which, in turn, was waiting to find out how much it would receive under the state aid program, then being revised. Later in the day, the issue was settled by granting the city the right to borrow $48,600,000 against the following year's state aid.

Editorial opinion in newspapers around the country was generally unfavorable to the strike. Many school leaders characterized it as "unprofessional" and illegal. However, some observers felt that the strike demonstrated that funds for schools could be found if necessary.

Educational Television.—On May 1, 1962, President Kennedy signed Public Law 87–447 to expedite the construction of new educational television broadcast facilities for schools, colleges, and nonprofit community organizations. Congress authorized the appropriation, on a matching basis, of $32 million for a five-year program, beginning July 1, 1962. Under the measure, funds can be used only for equipment, not for studios or housing. The intent of the law is to put new educational TV stations on the air. No state may receive more than $1 million. In the final hours of the 87th Congress a $550 million supplemental bill actually appropriating funds for educational television and other government programs was abandoned because of a Senate-House feud.

SANDERS IN THE GREENSBORO DAILY NEWS

"The Following Prayer Is Extemporaneous . . .!"

In December 1961 the Educational Media Study Panel, an official advisory group to the U.S. Office of Education, estimated a minimum of 1,197 educational TV stations as the nation's need. It reported that about 60 stations were on the air, with an additional 40 in various stages of planning or completion. Between 200 and 300 closed-circuit systems were in use in schools and colleges. A nationwide survey of educational television needs, published by the U.S. Office of Education in August 1962, indicated a need in the next decade for more than three times the 309 channels already allocated to educational TV.

National Defense Education Act.—As of June 30, 1962, nearly $300 million had been made available, under the National Defense Education Act of 1958, to elementary and high schools for strengthening instruction in science, mathematics, and modern languages. These funds were supplied on a 50–50 matching basis by the federal government and the states. More than 15,000 public classrooms have been remodeled to improve the teaching of these subjects, and over 4,000 new electronic language laboratories have been constructed.

Under the language-development program, more than 11,000 elementary and high school language teachers have attended summer sessions at 218 institutes to learn new methods and materials, for which purpose over $18.5 million has been expended. Fifty-three university language and area centers are offering instruction in unusual languages; more than 1,600 graduate students have been awarded fellowships for the study of 62 languages, most of them of critical importance to national purposes.

Accomplishments in other phases of the NDEA program are also impressive. Over 150,000 persons are enrolled in the various technical training programs. A total of $47.8 million has been made available to schools for guidance, counseling, and testing programs.

Student Loans.—Under the student loan program of the National Defense Education act, ap-

proximately 350,000 undergraduate and graduate students in 1,450 colleges and universities have borrowed $225 million to continue their education. About one fourth of the borrowers now paying off their loans have become elementary or secondary school teachers.

Grants have been made to 5,500 students under the graduate fellowship program, designed to train college teachers to help meet the current shortage. A total of 1,524 colleges and universities are participating in the student loan program in 1962–63, an increase of 74 over the 1961–62 total. Applications filed for federal contributions by 1,446 of these institutions totaled nearly $100 million for the 1962–63 session.

Among the institutions applying for 1962–63 funds are 22 colleges and universities which have filed provisional applications for a total of $2,990,608, stipulating that their participation would be contingent on the removal of the disclaimer affidavit. In its closing days the 87th Congress eliminated this feature of the act. Applicants for loans are still required to take an oath of allegiance to the United States.

School and College Enrollments.—For the 18th consecutive year, school and college enrollments in the United States increased, reaching an all-time high of 51,300,000 for the session of 1962–63, the U.S. Office of Education estimates. This is an increase of 2 million over the 1961–62 enrollment.

Enrollments in public and nonpublic elementary schools, kindergarten through grade 8, are expected to total 35 million pupils in 1962–63, an increase of 800,000 over the previous session. Secondary school enrollments are estimated at 11.7 million, an increase of 900,000 over the 1961–62 total. The larger increase in the number of high school pupils reflects the surge in births since 1945, an increase that up to now has been affecting mainly elementary school enrollments.

Included in these statistics are the schools operated by the Roman Catholic Church, in which the estimated total elementary and secondary enrollment for 1962–63 is 5,562,000 (elementary, 4,560,000; high school, 1,002,000). Parochial schools enroll approximately 11 per cent of the elementary and secondary school attendance in the United States.

The total number of students enrolled in public and private colleges and universities reached 4,600,000 in the session of 1962–63, an increase of 300,000 over the previous year. Statisticians point out that the really great increases in college enrollments will begin in 1965–66, when high school graduates born in the middle 1940's will be applying for admission. Between 1945 and 1947 there was an annual increase in the number of births of 1 million.

At present, the steadily mounting college enrollments are an indication of a growing interest in attending college rather than the result of higher birth rates, the Office of Education reports. The proportion of youth of college age actually attending college has been increasing since 1945.

Population Trends.—School enrollments are destined to continue to increase as the population grows. Population projections vary according to the assumptions on which they are based. The Bureau of the Census predicts a nation of from 209,000,000 (lower estimate) to 215,000,000 people by 1970, compared with an official total of 179,323,175 in the 50 states and the District of Columbia as of April 1, 1960.

If the population and school enrollment rates continue to increase as anticipated, the Bureau of the Census estimates educational enrollments as shown in the accompanying table.

U.S. EDUCATIONAL ENROLLMENT PROJECTIONS
(In thousands)

Total	Elementary (kindergarten-Grade 8)	High school (Grades 9–12)	College and university
1960....46,259	32,441	10,249	3,570
1965....54,360	35,755	13,226	5,379
1970....60,344	38,430	14,894	7,020
1975....66,721	42,411	15,985	8,325
1980....75,102	48,696	17,388	9,018

If these projections materialize, in the 20 years between 1950 and 1970 the school and college enrollment in the United States will have doubled, from 30 million to 60 million.

Classroom Shortage.—In spite of the record construction of 72,200 new classrooms in the year ending September 1961, the shortage of space still continues. The U.S. Office of Education estimated in January 1962 that 60,200 additional classrooms were needed to relieve overcrowding, and 67,000 to replace unsatisfactory facilities. An average of 69,100 new classrooms have been built annually for the last six years, only slightly more than the number needed to accommodate increased enrollments and to replace abandoned classrooms. The backlog of the shortage has remained at about 137,000 classrooms.

Teaching Staff.—In 1961–62 the public school instructional staff totaled 1,577,653, according to the National Education Association's Research Bureau. Of this number, 1,454,362 were classroom teachers (elementary, 875,959; secondary, 578,403). The number of teachers lacking full qualification for their state certification remained at approximately 97,000, or 6.7 per cent of the teachers employed.

Teachers' Salaries.—The National Education Association (NEA) reports that the average annual salary of classroom teachers in 1961–62 was $5,527, an increase of $252 over the previous year. Single salary schedules, now so prevalent, are reducing the gap between the average salary for elementary school teachers ($5,327) and high school teachers ($5,800).

Supplementary Employment.—A report made by the U.S. Department of Labor on multiple jobholders as of December 1960 showed that about 4.6 per cent of the 66 million persons then employed held two or more jobs. Nearly twice as many teachers (8.9 per cent) held a second job. Most of these were men: 23.5 per cent of all men teachers below the college level hold a second job, but only 2.5 per cent of the women. In no other primary occupational group did more than 8.9 per cent of the men have supplementary employment (*School Life,* January–February 1962).

Expenditures for Education.—In 1961–62, revenue receipts for public schools reached a total of $16.6 billion, an increase of 8.7 per cent over the previous year. Approximately 4 per cent was received from federal sources, 40 per cent from state funds, and 56 per cent from local and other sources, according to NEA reports. Current expenditures per pupil in average daily attendance averaged $414 in 1961–62, ranging from $220 in Mississippi to $615 in New York.

Federal Aid for Colleges.—In January 1962, President Kennedy, in his addresses on the State of the Union and on the 1963 budget, recommended increased federal aid for higher education, including loans for the construction of college academic facilities and funds for college scholarships. Bills to accomplish these goals met with difficulties concerning aid to church-affiliated colleges, as well as provision of federal funds for scholarships. After a stalemate of many months, House and Senate conferees on September 17

agreed on a compromise bill providing $2,345,000,000 for higher education, as follows:

Classroom construction—$1.5 billion authorized over five years, 60% for matching grants and 40% for loans. Funds could not be used to build facilities for divinity schools, sectarian instruction, or religious worship, or sports facilities to whch admission would be charged. Colleges supported by religious institutions, however, would be eligible.

Student aid—$595 million in loan funds over five years. Twenty per cent could be used for grants to needy and talented students. Divinity schools and seminaries would not be eligible.

Junior colleges—$250 million in grants authorized over five years.

This bill (HR 8900) simply authorized the program. Congress would still have to appropriate funds. On September 20, however, by a vote of 214 to 186, the House sent the bill back to the conference committee with instructions to remove all provisions for student assistance. The 87th Congress took no further action before adjournment.

Some supporters believed that the feature providing 20 per cent in scholarships had defeated the measure. Another factor was opposition to grants for schools with religious affiliations.

Faculty Salaries.—The U.S. Office of Education reports that average salaries for full-time faculty members in four-year undergraduate colleges rose to $7,680 in 1961–62, up about 4.8 per cent from the $7,330 average of the previous session and a 12.3 per cent increase from the $6,840 average of 1959–60.

In 1961–62, professors earned an average of $10,310; associate professors, $7,980; assistant professors, $6,750; and instructors, $5,520. The average salary in two-year institutions, all ranks combined, was $6,840.

College Charges.—The Office of Education reports a decided increase in costs for full-time students in both public and private institutions. Average tuition and fees for resident students in private institutions increased 8.1 per cent, from $676 in 1960–61 to $731 in 1961–62. In public institutions the increase was 3.4 per cent, from $179 to $185.

In the two-year period between 1959–60 and 1961–62 the average annual tuition and fees in private institutions increased 18.9 per cent in public institutions the increase was 10.1 per cent for resident students and 14.6 per cent for nonresidents. In 1961–62, average charges for dormitory rooms were: in public institutions, $189 for men and $193 for women; in private institutions, $231 for men and $249 for women.

Aid for College Students.—In May 1962 the U.S. Office of Education issued *Financial Assistance for College Students: Undergraduate*, a 360-page bulletin listing, by colleges, the number and amount of scholarships, loans, and work opportunities available, along with average amounts paid and closing date of application.[1] In 1959–60, the 1,677 institutions furnishing data for this bulletin aided 287,589 undergraduate students with scholarships totaling $98,157,544; they extended loans (exclusive of National Defense Education Act funds) totaling $14,362,182 to 52,322 students; and they employed 341,381 students for a total compensation of $98,491,619.

In addition to these institutional programs, 115,450 students were loaned $50,151,908 under the National Defense Student Loan Program in 1959–60. The NDEA figures include graduate students.

[1] The publication is available from the Superintendent of Documents (Bulletin 1962, No. 11; $1.25).

UPI

Francis Keppel, dean of Harvard School of Education, was named U.S. commissioner of education by President Kennedy on November 24.

Morrill Act Centennial.—On July 2, 1862, President Lincoln signed the first Morrill Act, granting public lands to states and territories in support of colleges to promote "liberal and practical education . . . in the several pursuits and professions of life." In a proclamation recognizing the centennial, President Kennedy hailed the land-grant colleges as "the nation's largest single source of trained and educated manpower." Over half of the country's trained scientists and nearly one half of all regular and reserve officers of the armed forces trained in civilian programs have come from the land-grant institutions.

Originally the income from the public lands was expected to constitute the federal support of the land-grant colleges, with the states contributing the remainder. However, through the Hatch, Second Morrill, Smith-Lever, and other federal acts, the services and support of these institutions have been greatly expanded and increased.

Now, in addition to the income from the original land grants, federal funds to aid the states in the maintenance of land-grant institutions amount to more than $100 million annually. For the year ending June 30, 1962, a total of $34,725,021 was appropriated for experiment stations, $10,744,000 for campus instruction, and $59,590,000 for extension education. In addition, these institutions received many millions in federal funds for contract research and services, both in the United States and abroad.

There are currently 68 land-grant institutions. Some are one with the state university, as in Minnesota, Missouri, and Tennessee; some are separate, as in Kansas, Oklahoma, and Virginia; and two, Cornell and Massachusetts Institute of Technology, function as a part of a private institution.

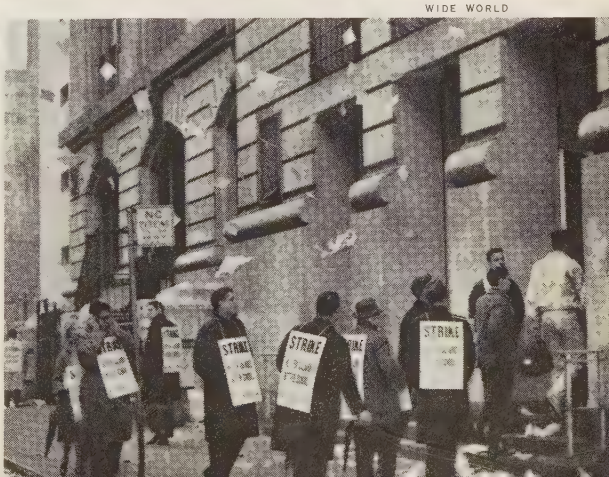
The Nongraded Primary Unit.—Like team teaching, the ungraded primary unit is a relatively new practice in elementary education. Milwaukee, the first large city to establish the plan, began its use in 1942. Interest in the plan has mounted rapidly. During the 1950's some 40 to 50 communities adopted it. By 1961 there were some 500 schools with ungraded primary units, and in 1962 the number was at least 1,000.

Briefly, the plan provides for grouping children beyond the kindergarten but below the fourth grade in what is called a primary grade. The classification of first, second, or third grade is eliminated. A child may complete the primary grade in two, three, or if necessary, four years. In some instances, the same teacher teaches the group; in others, the teacher changes yearly.

The lessons and experiences are those usually provided in first, second, and third grades, with the important difference that groupings are flexible. The child can progress in accordance with his potential and rate of growth.

New York City teachers, on brief strike for higher wages, picket outside Stuyvesant High School on April 11. Some students enter building as others toss paper from windows.

WIDE WORLD



He may work with one group in one subject, and in an entirely different group in another. He may even work individually in such subjects as reading. Nonpromotion is no longer a problem. The maximum development of each child is encouraged through flexible and appropriate groupings. It is not an "easy school," nor does it ignore the importance of challenging and difficult work.

School systems adopting the plan have cited as reasons: (1) the extensive research on the ineffectiveness of nonpromotion in stimulating achievement; and (2) the difficulty of providing adequately for individual differences.

Education and Income.—The relationship between time spent in school and lifetime earnings is confirmed again in a study summarized in *School Life* (June 1962). Eighth-grade graduates receive an average of 40 per cent or $52,000 more in lifetime earnings than men who did not complete the eighth grade. High school graduates earn 42 per cent or $76,000 more than eighth-grade graduates; and college graduates receive 69 per cent or $178,000 more than high school graduates.

Education also affects the differential between early and peak earnings. The average income for the eighth-grade graduate at age 50 is only 18 per cent above that at age 30; for the high school and college graduates the percentages are 28 and 72, respectively.

ELECTIONS, U.S.

In record numbers for a nonpresidential year, 51,462,319 persons, or about 47% of the 109,700,000 Americans of voting age, went to the polls in 50 states on Nov. 6, 1962.

Democrats obtained control of the 88th Congress by 68 to 32 seats in the Senate and by 258 to 176 seats in the House of Representatives; there was 1 vacancy in the House because of the posthumous election of Clem Miller, Democrat of California. (On the eve of the elections the Democratic margin in the 87th Congress was 64 to 36 seats in the Senate and 261 to 174 seats in the House; there were 2 Democratic vacancies in the House. For the new 88th Congress the size of the House was reduced from 437 to its normal 435, with seats added for Hawaii and Alaska on their admission to the Union now included within the regular apportionment.) The death of Democratic Sen. Dennis Chavez on November 18 resulted in the appointment (November 30) of Republican Edwin L. Mechem to the Senate after he had resigned the governorship of New Mexico to permit the lieutenant governor to become governor. The alignment in the Senate was thus revised to 67 Democrats and 33 Republicans.

In races for 39 Senate seats (21 held by Democrats and 18 by Republicans), Democrats won 25 and Republicans 14, for a net Democratic gain of 4. Democrats were elected to replace Republicans in Connecticut, Indiana, Maryland, New Hampshire, South Dakota, and Wisconsin, while Republicans replaced Democrats in Colorado and Wyoming. For the House seats, all of which were subject to election, Democrats received a majority of the votes cast in the nation. (An estimate of 55.3% for the Democrats, made by the Gallup Poll on November 11, was disputed by William E. Miller, chairman of the Republican National Committee, who on November 19 claimed 48.1% for the Republicans. In some cases, returns for unopposed candidates were unavailable.) Republicans won 12 Democratic-held seats, and Democrats gained 7 held by Republicans. Elected to the House were 368 incumbents, 65 newcomers, and 2 former members. Because of reapportionment after the census of 1960, 206 members were elected from districts created or changed since the 1960 election. Reapportionment reduced the number of representatives from Eastern states by 7 and from Southern and Midwestern states by 4, but increased Western representation by 10. The 8 new districts in California went Democratic. In the South, Republicans were elected in 11 districts, for a gain of 4. (See also REAPPORTIONMENT AND REDISTRICTING.)

The Republican senators defeated were Joe H. Bottum, South Dakota, by George McGovern; Homer E. Capehart, Indiana, by Birch E. Bayh; and Alexander Wiley, Wisconsin, by Gov. Gaylord Nelson. The Democratic senators defeated were John A. Carroll, Colorado, by Rep. Peter H. Dominick; and J. J. Hickey, Wyoming, by Milward L. Simpson. Other new Democratic senators were Abraham A. Ribicoff, Connecticut, former secretary of health, education, and welfare; Representatives Daniel K. Inouye and Daniel B. Brewster, Hawaii and Maryland, respectively; Edward M. Kennedy,

[1] Plus 2 vacancies. [2] Plus 1 vacancy. [3] Plus 1 vacancy in House totals before and after elections. [4] Plus 1 vacancy in House total before elections. [5] The appointment of a Republican on November 30 to the Senate vacancy in New Mexico changed the post-election figures to 1 Democrat and 1 Republican, and the Senate total to 67 Democrats and 33 Republicans.

Massachusetts, youngest brother of the president; and Thomas J. McIntyre, New Hampshire. Democratic Sen. Lister Hill, Alabama, was reelected by 50.8% of the vote. Jacob K. Javits, Republican, New York, was reelected by a margin of 971,877, carrying New York City as well as suburban and upstate areas. Democrat Carl Hayden, Arizona, 85, senior member of the Senate in age and service, Everett McKinley Dirksen, Illinois, Republican minority leader, and Thruston B. Morton, Kentucky, former chairman of the Republican National Committee, were reelected, respectively, by 54.9, 52.0, and 52.6% of the votes in their states.

Of 35 contested governorships (21 held by Democrats and 14 by Republicans), Democrats won 20, and Republicans 15. The distribution of governorships in the 50 states became Democratic by 33 to 17, for a net Republican gain of 1. Democrats overturned Republican administrations in Hawaii, Iowa, Massachusetts, New Hampshire, New Mexico, and Vermont. Republican governors were elected to replace Democrats in the industrial states of Pennsylvania, Ohio, and Michigan, each with great electoral significance for 1964, and also in Colorado, Oklahoma, Rhode Island, and Wyoming. The reelection of Nelson A. Rockefeller as governor of New York by 518,218 votes placed him in the first rank among Republican presidential possibilities for 1964. William W. Scranton, elected governor of Pennsylvania by a margin of 470,177 votes over former Philadelphia Mayor Richardson Dilworth, and George W. Romney, who defeated Gov. John B. Swainson by 78,497 votes for the governorship of Michigan, became prominent Republican presidential prospects. Richard M. Nixon, defeated for the governorship of California by incumbent Democrat Edmund G. (Pat) Brown by 301,568 votes, was removed from major consideration as a Republican presidential candidate in 1964. In Nebraska, Fred A. Seaton, former secretary of the interior, was defeated for the governorship by incumbent Democrat Frank B. Morrison. In Texas, John B. Connally, Democrat, was elected by 54.1% of the vote in the closest gubernatorial race since reconstruction times.

A list of the 35 governors elected in 1962 follows:

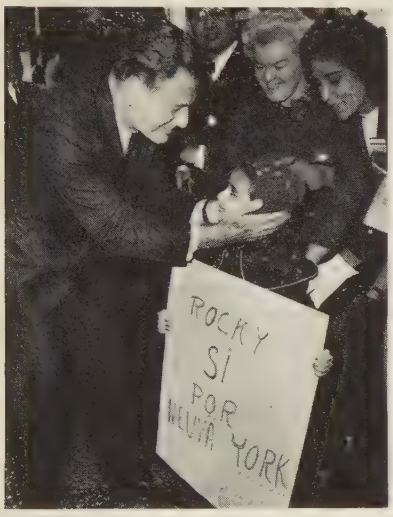
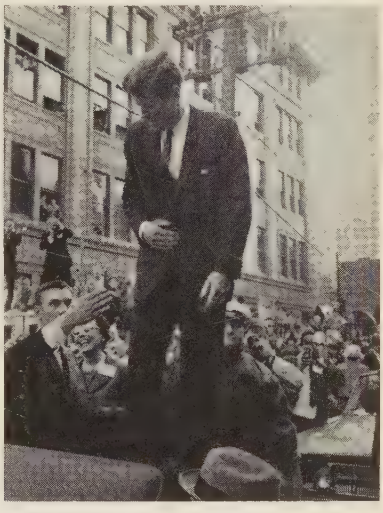
After the 1962 elections, Republicans controlled both houses of the legislatures in 19 states, as compared with 14 before the elections, and had a majority in one house in 4 other states. New York State voters rejected a plan to move low-income families from public to private housing projects with state financing. Constitutional changes to reduce residence requirements for voting were approved in Colorado, Kansas, and North Carolina, but were rejected in Washington. San Francisco Bay area counties voted a $792 million bond issue for a rapid transit system, St. Louis approved $95 million in bonds for pollution control of Mississippi River water, and Cincinnati agreed to a $16 million bond issue for the renewal of blighted waterfront areas. In St. Louis and in Memphis proposals to combine city and county governments were rejected.





UPI

(*Left*) New York's Governor Rockefeller is greeted by young admirer on September 20, after winning nomination for second term. He was reelected on November 6. (*Right*) President Kennedy prepares to speak in Aliquippa, Pa., in October.

On August 27, Congress proposed a constitutional amendment, subject to ratification within seven years by three fourths of the state legislatures, forbidding the use of a poll tax as a requirement (now imposed in five Southern states) for voting in federal elections.

ELECTRICAL INDUSTRIES

Great strides were made in the electrical field during 1962, mainly in the electronics category. The active satellite Telstar was put into orbit, as a means of telephone and television communication between the United States and Europe, by the American Telephone & Telegraph Company and the United States government (see also SPACE FLIGHT; TELEPHONE); advances were made in the computer field; and increases in power and voltages occurred in power generation.

Communications.—One advance which has far-reaching possibilities was the installation of an all-

electronic telephone system in Etna, N.Y. Connections between subscribers are completed in microseconds, and other advantages for the users are incorporated. When busy signals are heard, the calling party does not have to dial again; the circuitry "remembers" the party called, and when the line is not busy the calling party is notified.

Computers.—Airline seat inventories can now be made in seconds by means of a Univac computer installed at Charlotte, N.C. When a customer talks to a reservations agent, either across a counter or by telephone, the agent may, by pressing the proper buttons on a small desk instrument, determine the availability of seats up to a year in advance. This system coordinates reservations in 42 cities in the United States.

An electronic stock-quotation service that provides split-second information on prices after they are officially quoted on the floor of an exchange has been demonstrated by the Ultronic Systems Corporation. A master computer collects and codifies 40,000 financial facts on 4,000 stocks. Information is sent over leased lines to nearby cities, where a broker can answer questions about the status of a stock or commodity at the touch of a finger on a small desk unit.

Research.—A new electron accelerator at Cambridge, Mass., produces the fastest, most intense beam of electrons in the world. This $12 million instrument spins electrons around a 236-foot track, a ring of magnets keeping them on course. On each circuit a particle receives 32 electrical "kicks," varying from 20,000 to 200,000 volts, which increase its energy by a maximum of 6.4 million electron volts per turn. After 10,000 circuits, taking less than 0.01 second, the electrons have accumulated an energy of 6 billion electron volts. This accelerator is to be used for electron-scattering experiments by which physicists can "see" the internal structure of protons and neutrons. (See also ATOMIC ENERGY; PHYSICS.)

A means of photographing distant planets was being developed, involving sending a special telescopic camera up to 80,000 feet by balloon (Stratoscope II) directing and focusing it by radio, and transmitting the images to the ground by television where monitors are set up. This high-altitude photography renders the atmosphere's influence negligible.

Consumer Developments.—Because consumers have indicated that they prefer electric light bulbs with longer life to those with greater illuminating power, a new bulb has been developed with a rated life of 1,350 hours, as opposed to about 1,000 hours for the regular bulb. The filaments of these new bulbs are 18.4% longer than those used in ordinary lamps and are made of tungsten drawn thinner than a human hair.

A new mercury-vapor lamp produces 78 lumens per watt, as compared with 54 for an ordinary fluorescent lamp and 17 for an incandescent bulb. The latest mercury lamp was developed from the discovery that the rare element thallium could be added to mercury to form a highly efficient transducer for converting electric energy into light. These lamps produce more than 31,000 initial lumens, as compared with 21,500 in present types of lamps of the same wattage.

Various small household appliances which are operated by electric motors are now battery-driven by means of small storage batteries. These batteries can be charged by plugging a special device into the ordinary 110-volt house-lighting circuit.

Tests.—Equipment called the Pulse Echo Fault Locator can locate faults in undersea cables to within 80 yards under normal conditions. The British-designed locator sends a search signal along the cable at a speed of 100,000 miles per second, a fault returning an echo to a double-beam cathode-ray tube, which displays the pip on the upper trace against crystal-controlled markers on the lower trace, representing nautical miles of cable.

An ultrasonic gun aimed at a high-voltage transmission line tests it for corona effects caused by defects. If defects are present, a corona produces ultrasonic waves which are made audible by electronic circuits. A telescopic rifle sight pinpoints the sources of corona with high accuracy.

Industry.—A furnace based on a new heating concept can produce temperatures in excess of 5000°F. within a matter of seconds. It is about the size of a breadboard and plugs into a standard electrical outlet. A strip of graphite cloth is the heating element on which the specimen to be heated rests, and the electrical energy is controlled by an autotransformer. It is claimed that the specimen can be handled 15 seconds after the current is turned off.

ELECTRIC LIGHT AND POWER INDUSTRY

Power Plant Generating Capacity.—The total generating capacity in the United States, excluding Alaska and Hawaii, on Dec. 31, 1961, was 197,923,000 kw. Of this total, 180,119,000 kw. were in plants of the electric utility industry, the remainder in plants not contributing to the public supply. In the electric utility industry, the investor-owned companies had a capacity of 136.4 million kw.; government-owned projects had a capacity of 42.3 million kw.; and cooperatives had nearly 1.4 million kw. Gross additions of 12.53 million kw. in generating capacity in 1961 compared with about 11 million kw. for 1960. Construction expenses for the industry decreased in 1961 to $3.26 billion, compared with the all-time-high figure of $3.76 billion in 1958. It was expected that in 1962, construction would amount to about $3.4 billion for the investor-owned utilities.

Nuclear Power Plants.—By the end of 1962 there were 26 stationary civilian nuclear power plants in the United States with electric capacities of 4,500 kw. or larger. Twelve were in operation, 10 in design or under negotiation or construction, and 4 in various stages of planning. Electric power companies were participating in 17 of the 24 projects and government cooperatives in 9. The 26 projects will have a combined ultimate capacity of about 3.5 million kw. (See also ATOMIC ENERGY.)

U.S. and World Power Production.—In 1961 the electric power industry in the United States in-

ELECTRIC ENERGY PRODUCTION, BY MAJOR COUNTRIES, 1960

Country	Millions of kw.-hr.	Country	Millions of kw.-hr.
Argentina	7,848[1, 2]	Japan	128,338[6]
Australia	25,464	Mexico	11,748
Austria	13,740[1]	Netherlands	17,496
Belgium	15,144[2]	New Zealand	7,320[1]
Brazil	21,108[3]	Norway	33,420[4]
Canada	113,220[4]	Poland	32,208
Czechoslovakia	26,964	Rumania	7,656[2]
Denmark	4,692[1, 4]	South Africa	24,552[7]

WESTINGHOUSE; AMERICAN ELECTRIC POWER

(*Left*) Technician demonstrates use of ultrasonic "gun" in detecting electrical leakage, or corona, in high-voltage power lines. Gun makes audible the ultrasonic waves emitted by corona. (*Center*) Insulated from ground and charged at the same voltage as the line, barehanded men repair 34,000-volt transmission line. (*Right*) Helicopter-borne tower is installed.

creased its power generation by 5% over 1960, bringing it to a total of 881,655 million kw.-hr., including Alaska and Hawaii. Of this total, 791,975 million kw.-hr. was produced by the electric utility industry; 86,555 million kw.-hr. by other sources, such as industry, mines, and railways, whether or not they supplied electricity to the public; and 3,125 million kw.-hr. in Alaska and Hawaii combined. The Atomic Energy Commission required 1.8% less electricity than in 1960.

During 1961, according to the *Monthly Labor Review* of the U.S. Department of Labor, the United States electric light and power utilities, including Alaska and Hawaii, employed some 252,200 persons; and electric light and gas utilities together employed some 175,300 persons, making a grand total of 427,500 employees. The accompanying table shows the major categories of electric energy sales and revenues during 1961.

U.S. ELECTRIC ENERGY SALES AND REVENUES, 1961[1]

Classification[2]	Customers (number)	Revenue (millions of dollars)	Distribution (millions of kw.-hr.)
Commercial, industrial	7,358,981	6,537.8	482,291
Residential	52,569,050	5,115.8	209,021
Highway illumination	63,459	205.4	6,762
Railroads, railways	94	62.9	4,685
Other public authorities	135,653	232.3	16,438
Interdepartmental[3]	2,943	15.1	1,531

[1] Including Alaska and Hawaii. [2] Revised to allocate formerly used classification of "Rural" to other appropriate classes of service. [3] To other departments, such as water, gas, and ice. (Source: Edison Electric Institute.)

The total number of residential customers at the end of 1961 was about 52.5 million, which included about 177,000 in Alaska and Hawaii; this was an increase of about 2.2% over 1960. Revenues from energy sales to ultimate customers in 1961 were higher than in 1960, following the trend over the past 20 years. The residential classification continued to produce the greatest proportion of the revenue, with 42% of the total coming from this source, greater than either commercial or industrial sales singly. Industry-owned electric utilities accounted for 82% of the total revenues in 1961, as in 1960.

In 1961, investor-owned companies in the United States produced about 76% of the total electric energy generated, compared with 23% for all government output. Steam generation accounted for about 80% of the total production; hydro generation for 19.2%, and internal combustion for 0.6%. Coal continued to be the major fuel, accounting for 65.9% of the total thermal generation. Gas was second with 26.4%, then fuel oil with 7.4%, and nuclear fuel with 0.3%.

The cost of all types of fuel has nearly doubled since 1939. As compared with 1960, the 1961 cost of coal decreased from $6.26 to $6.22 per ton, while the cost of fuel oil increased by 6 cents per barrel and the cost of gas increased 1.8 cents per thousand cubic feet. (See also FEDERAL POWER COMMISSION; PUBLIC UTILITIES.)

Former Associate Editor, "Electrical Engineering."

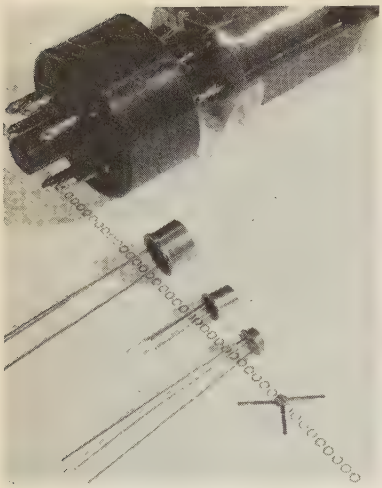
ELECTRIFICATION, Rural. See FARM SERVICES.

ELECTRONICS

The outstanding achievement of 1962 in electronics was the successful orbiting and operation of the electronic equipment of the communications satellite Telstar, launched on July 10. A Bell Telephone Laboratories project, it involved more than 1,800 subcontractors and suppliers. Most of the 15,000 separate parts of the satellite itself are electronic products. Although millions of Americans have seen television pictures relayed by Telstar, only 7% of the 2,528 transistors and diodes aboard handle television signals; the remainder are in command and telemetry circuits. The latter supply data to the ground on radiation, micrometeorites, temperature, pressure, sunlight, and about 100 other items of important information. (See also SPACE FLIGHT; TELEPHONE.)

Basic Research.—A new electrical effect in a semi-metal was announced. When strong electric and magnetic fields were applied to bismuth at temperatures close to absolute zero, it was found that the semi-metal did not follow Ohm's law. As the fields reached a certain strength, an abrupt change in its electrical characteristic appeared. Further investigation may prove useful in increasing the speed of computers.

The speech research laboratory at Air Force Cambridge Research Center includes an electronic computer that breaks down the human voice spectrum into 400 basic patterns. It is used in studies of complicated speech waveforms as part of the laboratory's speech compression program, including determination of the minimum signal for transmission and reception of information.



Transistor at lower right performs the same functions as the vacuum tube, top. Intermediate sizes of transistors illustrate the gradual miniaturization of equipment.

HUGHES AIRCRAFT CORP.

Automotive Ignition.—Electronic ignition systems for automobiles and trucks have been under development for several years. One car manufacturer now has made a transistor system optional on one 1963 model. Its major advantage is that the breaker points need handle only a small amount of current, instead of the much heavier current of the conventional system. Life of the points of a transistor system is estimated at 75,000 to 100,000 miles, about 10 times greater than that of conventional points. Other transistor systems still in development use no points at all, employing a pulse generator instead.

Medical Applications.—Live heart signals from an electrocardiogram were sent by telephone from one hospital and charted on a direct-writing oscillograph at another. The receiving recorder is similar to that used for readout of space vehicle data. Thus far experimental, the technique will allow heart specialists to make diagnoses for patients many miles away.

The first computer installation was made in a center for the diagnosis and treatment of cancer. The computer will be used in applying data-processing techniques to the study of radiation in diagnosing and treating cancer patients. It will be used initially to determine quickly and accurately such information as the amount of radiation from external sources delivered to cancer tissues and surrounding normal tissues, and the distribution of radiation by needles and seed implants. Additional data on radiation doses delivered through the body by metabolic means and measured by blood, urine, and other external counting or radiation activity will also be fed to the computer.

Taken through a field ion microscope, photo shows the arrangement of atoms in an extremely fine wire of tungsten.

U.P.I.

Microelectronics.—The micromodule program begun in 1958 by the U.S. Army was pronounced a success in 1962. The Army will spend $8 million on production of micromodule equipment and systems in fiscal 1963, double the amount of the previous year. Production of 1 million micromodules a year is expected by June 1964, and the rate will reach 3 to 5 million in 1965. Micromodules are composed of tiny wafers carrying electronic components that form circuits.

X-Rays in Space.—The first indication that X-ray astronomy in the night sky was possible was reported in June 1962, when a radiation-counter rocket probe discovered X-rays of much higher intensity than expected coming from the galactic center and around α Cassiopeiae. The probe was intended to detect X-ray reflections from the moon, hopefully leading to analysis, but the lunar reflections were obscured. An X-ray telescope—a collimator that can collect and focus soft X-rays of galactic origin—is planned. It is expected to aid in X-ray astronomy and in analysis of the moon's composition by measuring the intensity of lunar-reflected radiation. The collimator is a paraboloid cone of high-reflectivity material. Soft X-ray analysis of the moon can tell the ratio of elements present, but not their specific composition.

Automation.—A new character scanner is capable of "reading" four different intermixed type styles simultaneously. A sensor in the scanner detects characters by sensing reflections from characters and their related background. Information obtained is converted and compared with stored information. The scanner has a reading rate of 600 numbers a second, 500 alphanumeric characters a second, and a load, unload, and scan line-to-line time of 3.3 lines a second.

Drawings for aircraft and missile parts and assemblies are produced automatically by a numerically controlled engineering drafting machine put into operation in 1962. It can make design and full-scale drawings more quickly and accurately than can human draftsmen, and at less expense, from information fed into it by punched tape.

Pictures on Tape.—A facsimile transmitter has been modified to serve as a photographic input to a digital computer. Photo details go into the computer on a cell-by-cell basis so that the computer will be able to perform cognitive processes. The input will be used for automatic photo interpretation, character recognition, and other cognitive systems research. Ninety seconds are required to insert a 5- by 5-inch photograph, which is broken down into some 250,000 individual elements, each having 16 levels of gray intensity. Storage on tape provides a library of photographs.

A low-cost analog computer is used in an automatic, daylight, color-printer processor for amateur photographers. The computer determines color balance in the film negative, and the processor turns out a print in three minutes.

Atoms Made Visible.—The field ion microscope now permits direct visual observation of the atomic structure of metal surfaces. Comparison of two micrographs, taken before and after an irradiation event, will show the change in position of even a single atom. An electronic technique, field ion microscopy can be used at present only on the refractory metals, and specimens must be formed with extremely fine needle tips. This is the only microscope technique powerful enough to show directly the individual atoms of surfaces in their crystallographic arrangement and with their crystal imperfections.

EL SALVADOR

Bordered by Guatemala on the north, Honduras on the east, and the Pacific Ocean on the south and west, El Salvador is the smallest and most densely populated of the Central American republics. It has an area of 8,259 square miles, and a population of 2,500,000 (1961 census), of which 61% is rural. Principal cities and populations (1960 est.) are San Salvador, the capital, 252,591; Santa Ana, 140,342; San Miguel, 77,622. Over 90% of the population is of Indian-European descent. Spanish is the official language.

Government.—Under the constitution of 1962, executive power is vested in a president, elected by popular vote for a five-year term and not eligible for immediate reelection. On April 29, J. A. Rivera was elected president for the term beginning July 1, 1962. The constitution also provides for a National Assembly. The 54-member Constituent Assembly that had been elected in December 1961 declared in January 1962 that it would constitute the National Assembly for a term from Jan. 25, 1962, to May 31, 1964. The country is divided into 14 departments for administrative purposes, each headed by a governor appointed by the president.

Education and Religion.—Primary education is free and compulsory in theory, but facilities are not sufficient for all school-age children. Number of schools (with enrollments), 1960: 2,479 primary (321,445); 158 secondary (20,658); 67 technical (8,898); 43 normal (3,699); and 2 institutions of higher learning (2,127 in 1959). About 21% ($16 million) of the 1962 national budget was allocated to education. Most Salvadorans are Roman Catholics.

Finance.—Budget estimates, 1961: revenue, 170.3 million colones; expenditure, 188.0 million. The actual deficit for 1961 totaled 15.4 million colones. Estimated revenue and expenditure for 1962 balanced at 184.9 million colones. The colón is equal to U.S.$0.40. External public debt (June 30, 1962): $66 million. Gold and foreign exchange reserves of the Central Bank (February 1962): 77.5 million colones (up from 45.4 million on Dec. 30, 1961, and 36.5 million on Dec. 30, 1960).

Transportation and Communications.—Two foreign-owned railways operate 469 miles of track in El Salvador and connect with Guatemalan lines. There are more than 2,000 miles of national highways (some 500 paved), including the Pan-American Highway and the 273-mile Littoral Highway completed in January 1962. A feeder road program, financed in part by the World Bank and totaling 194.2 miles, was 78% complete at the end of March 1962. There are three seaports and one international airport (Ilopango, near San Salvador).

Manufactures and Minerals.—Chief industrial products (1960, in 1,000 colones): food and drink, 28,932; alcoholic beverages, 17,930; textiles and clothing, 29,272; cement products, 8,086; silver, 75,846 troy ounces; electric power, 94,539 million kw.-hr. The manufacturing production index (1956 = 100) was 149.4 at the beginning of 1961 (134.4 a year earlier).

Agriculture.—El Salvador usually is self-sufficient in most of its chief food crops—beans, rice, sorghum, and sugar—but frequently must import corn; nearly all tillable land is in use. Chief crops (est., 1961–62): coffee, over 1.7 million bags of about 132 pounds each; corn, 143,000 metric tons (178,000 in 1960–61); cotton, 270,000 bales (176,000 in 1960–61); sugar, 57,500 tons.

Foreign Trade.—Total exports, 1961: $119.04 million (up 2% from 1960); imports, $108.44 million (down 11% from 1960). Coffee is by far the most important export, with cotton a remote second. Coffee exports for the crop year 1960–61 totaled 1.16 million bags (46% to West Germany and 42% to the United States). About 80% of the record cotton crop was sold to Japan. Imports of corn were necessary in both 1961 and 1962.

Events, 1962.—The serious decay of the government's fiscal position that had developed in 1961 as a result of an excess of imports over exports and a large inflation of credit was somewhat alleviated in 1962. Government efforts to reduce imports, Central Bank loans to private borrowers, and the budget brought about an increase in the net gold and foreign exchange reserves of the Central Bank from 45.4 million colones on Dec. 30, 1961, to 77.5 million by the end of February 1962. These actions were taken to ease pressure on the colón, and because the International Monetary Fund (IMF) made stabilization a condition of aid. By the end of 1961, El Salvador had drawn $14 million from stabilization loan funds totaling $21.25 million made available by the IMF and the Export-Import Bank of Washington. By early 1962, however, the stabilization program was going well enough so that the Central Bank could repay to the IMF a substantial part of its stabilization loan. Development loans from international agencies to El Salvador for 1962 totaled more than $21 million by the end of 1961.

The record 1961–62 coffee crop (over 1.7 million bags) was considerably larger than El Salvador's 1.3 million-bag export quota set by the International Coffee Agreement. To meet this problem, in 1962 El Salvador shipped some semiroasted coffee on the theory that only green coffee fell within the quota system. This led to complaints from other participants in the system.

In January the Constituent Assembly, whose 54 members were affiliated with the Party of National Conciliation (PCN)—the "official" party of the Civil-Military Directorate which had been running the country since January 1961—promulgated a new constitution, much like that of 1950; set April 29 as the date for a presidential election for the term July 1, 1962, to June 30, 1967; and elected as provisional president of the country Eusebio Rodolfo Cordón. On January 25 the Constituent Assembly became the National Assembly, Cordón was inaugurated, and the Civil-Military Directorate turned over its powers to the Assembly and the president.

Immediately after announcement of the presidential election date, the opposition parties began preparations. It was not long, however, before they were charging that the PCN was not going to permit free campaigning, that insufficient time was allowed for preparations, and that the supervising electoral board would not be fair. In March, four opposition parties informed the board that they would not enter candidates unless certain conditions were met, including postponing the election to August and extending an invitation to an Organization of American States group to inspect election conditions. The board would not agree to all the terms proposed (including the inspection group), and in April resigned because of its inability to persuade opposition parties to offer candidates.

The PCN had chosen as its candidate Col. Julio Adalberto Rivera, who had been a leading member of the Civil-Military Directorate. Rivera campaigned vigorously throughout the country, emphasizing the socioeconomic reforms that the Directorate had promised. Rivera was duly elected on April 29 and inaugurated on July 1.

Demonstrations and strikes against the government during the year occasionally were accompanied by violence, including bombings. Some of these actions clearly were leftist, and often directed at the United States. Leftist demonstrations on Salvador's Independence Day in September led to a drastic antisubversive law that went into effect in October. The law, which provided prison terms for those found guilty of Communist activities, organizing illegal strikes, inciting sabotage or destruction, impairing the national economy, and handling explosives, immediately provoked heated debate in the country. Passage of the law was taken as further evidence of a turn to the right by the PCN, already suggested by the slowed pace of the program of economic-social reform result-

ing in part from vigorous conservative opposition.

Professor of History, Syracuse University.

EMPLOYMENT. See LABOR and the Index entry, *Employment.*

ENDOCRINOLOGY

Important developments occurred throughout the field of endocrinology during 1962. A test was worked out for mild pituitary ACTH insufficiency, an artificial radioactive isotope began to replace some types of pituitary surgery, and various new drugs proved beneficial, while the effects of others were being checked.

Test of Pituitary Function.—The recognition of pituitary insufficiency of severe degree is not difficult by ordinary clinical examinations, but there has long been a need for a simple test of residual pituitary function to assist in the diagnosis of hypopituitarism of milder degrees. From a practical clinical viewpoint, it is important to recognize such patients, for they run the danger of developing adrenocortical insufficiency under the stress of surgery or other trauma.

Methopyrapone (Metopirone) has the unique property of selectively inhibiting 11-beta hydroxylation in the biosynthesis of the three main corticosteroids: hydrocortisone (cortisol), corticosterone, and aldosterone. Individuals with normally functioning pituitary and adrenals, when given methopyrapone, respond with a decrease in plasma cortisol. Since pituitary release of adrenocorticotrophic hormone (ACTH) is dependent on the levels of the circulating cortisol, an intense stimulation of ACTH secretion occurs in order to raise the plasma levels to normal. However, in the presence of the continued enzymatic blockade at the step which leads to cortisol and corticosterone synthesis, there is a marked increase in their precursors—11-deoxycortisol and 11-deoxycorticosterone—in the plasma and their metabolites in the urine. The urinary excretion of these compounds can be measured by determining the 17-hydroxycorticosteroids or 17-ketogenic steroids. Although these tests are not done routinely in most hospital laboratories, they are quite widely available from laboratories which specialize in endocrine determinations. This test, of course, measures only the ability of the pituitary to secrete ACTH, and not the other trophic hormones.

Progestational Agents.—Several synthetic steroids with potent progesterone-like activity have been developed and have found widespread usefulness in clinical medicine. They are employed in many everyday gynecologic problems such as dysfunctional uterine bleeding, premenstrual tension, cystic mastitis, and in certain types of recurrent spontaneous abortion. Medroxyprogesterone acetate and norethindrone are two such compounds.

Enovid is a mixture of a progestational agent plus an estrogen, which has found widespread acceptance as an oral contraceptive agent. It has been known for years that estrogens inhibit ovulation, but estrogens alone have never been used for birth-control purposes, because the dosages necessary to stop ovulation often also caused abnormal uterine bleeding. However, when estrogen is combined with the progestational agent, the mixture effectively suppresses ovarian function and only rarely are bleeding problems encountered. In general these drugs are safe, and it has been only recently that the use of Enovid has possibly been associated with a few cases of serious thrombophlebitis. Even if this proves to be merely a coincidence, there are some conservative physicians who question the wisdom of using potent hormone preparations for millions of women for long-term contraceptive purposes, especially inasmuch as most women who are interested in birth control have in the past accomplished the same result using more "old-fashioned" but time-tested methods.

Delalutin (17-alpha-hydroxyprogesterone caproate) in very large doses has been found to have palliative benefit in far-advanced, inoperable cancer of the uterine endometrium.

Hypophysectomy.—Surgical extirpation of the pituitary gland is performed for a number of serious conditions, including certain tumors of the pituitary, certain inoperable metastatic cancers, and progressive "malignant" exophthalmos. It has been found that pituitary function can be ablated by the implantation of yttrium-90 pellets into the sella turcica, which is simpler than the open surgical procedure. Yttrium-90, an artificial radioactive isotope with a half-life of 2.5 days, emits a potent beta radiation.

Anovulation.—The induction of ovulation in infertile anovulatory females is one of the areas of human reproduction which has met with very little success. Small doses of X-irradiation to the pituitary and ovaries are successful in selected cases, but are used with reservation because of the fear of producing gene mutations. Surgical resection of polycystic ovaries is also sometimes successful, and the amenorrheic, hirsute female can sometimes be made to ovulate with certain cortisone derivatives. A new drug, chloramiphene, has shown promise in some patients with functional anovulation. Chloramiphene is structurally related to a nonsteroid estrogen, but it does not have estrogenic, progestational, or corticoidal activity. It seems to act as a pituitary "modifier" and is capable of inducing ovulatory menses as well as sustaining the corpus luteum for periods longer than the usual 14-day luteal phase.

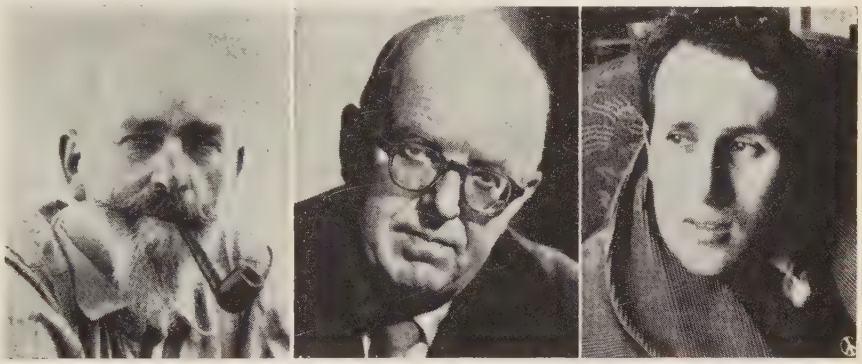
ENGLISH LITERATURE

Certain events on the outskirts of literature probably attracted a wider audience than any books published in 1962. Of these, the most sensational was F. R. Leavis' intemperate attack on C. P. (Sir Charles Percy) Snow as scientist, novelist, and man in "The Two Cultures?—The Significance of C. P. Snow," his final Richmond lecture to the students of Downing College, Cambridge. The title of the lecture had its source in Sir Charles' Cambridge University Rede Lecture, "The Two Cultures" (1959), in which he maintained that the abyss that exists between men of letters and scientists is a serious threat to our civilization. Extra-literary events that aroused less hostility included the dedication on June 16 of the Martello Tower at Sandycove, Ireland (setting of the first episode in *Ulysses*) as a James Joyce museum, and the festival of the arts held at Wellingborough by Center 42, the movement led by the proletarian playwright Arnold Wesker to enhance the cultural life of the English working class.

Fiction.—Of the novels published toward the end of 1961, Richard Hughes' *The Fox in the Attic* was probably the most remarkable. It is the

first in a projected series entitled *The Human Predicament* that will cover the period from the Munich *Putsch* in 1923 to the end of World War II. The principal character is a naïve English aristocrat who goes to Germany and becomes alert to the aftermath of the war in that country and the beginnings of Hitler's rise to power. Evelyn Waugh's *Unconditional Surrender* (American title, *The End of the Battle*) completed the trilogy initiated by *Men at Arms* (1952) and continued in *Officers and Gentlemen* (1955). The final volume sets forth not only the hero Guy Crouchback's resigned acceptance of things as they are but also his efforts to accomplish some good in an evil world.

Angus Wilson, in *The Old Men at the Zoo*, strove to combine a realistic-satirical account of the power struggle among the aging staff of a zoo and the impact on them of a boldly imagined nuclear war. In *The Prime of Miss Jean Brodie*, Muriel Spark, against the background of her native Edinburgh, studied the influence of a strong-minded if somehow sinister teacher on a group of her favorite students. *Key to the Door*, by the proletarian novelist Alan Sillitoe, described the grim experiences during the Depression and in military service of a brother of the hero of his first and best book, *Saturday Night and Sunday Morning* (1958).



Important figures in English literature in 1962: (*from left to right*) Richard Hughes, author of *The Fox in the Attic;* C. P. Snow, novelist, who was the subject of a scathing attack; and Arnold Wesker, a playwright and leader of a "proletarian" movement.

SANDRA LOUSADA; WALTER BIRD; STUDIO BRIGGS.

Among the novels that appeared in 1962, there were noteworthy offerings by writers of diverse literary generations. Aldous Huxley's *Island* described the utopian lives of the inhabitants of a South Sea island as seen through the eyes of a disillusioned English journalist. Huxley's account of the sources of the journalist's unhappiness had a compelling immediacy greater than did his description of the earthly paradise, and the paradise itself is not spared the inescapable internal threats of pain and death or the final threat of destruction from external violence. Christopher Isherwood's *Down There on a Visit* contrasted the author-observer's youthful with his mature reactions to four major characters whose sexual activities he viewed with an almost chilling detachment. In *The Kindly Ones* (the Greek furies), sixth volume in Anthony Powell's social panorama, *The Music of Time*, the experience of the narrator as a boy during World War I served as a prelude to his mature preparation for involvement in World War II and showed the impact of the approaching events on characters familiar and unfamiliar.

An Unofficial Rose, by Iris Murdoch, resembled *A Severed Head* (1961) in the extremely complex pattern of its characters' amorous relations, and developed the theme that love is a fatality of which the consequences in most cases fall far short of satisfying fulfillment. In *The Spoilt City*, second volume of a proposed trilogy, *The Great Fortune*, Olivia Manning described sensitively the approach and impact of World War II on Rumania and contrasted the heroine's keen awareness of its perils with her husband's unrealistic attempts to offset the Nazi threat. A more ambitious but not completely integrated novel was Doris Lessing's *The Golden Notebook*. Within the framework of current events, it presented the contents of four notebooks devoted to the heroine's varied interests in love, politics, imaginative writing, and a record of her actual life. John Braine's *Life at the Top* continued the history of Joe Lampton, hero of *Room at the Top* (1957), and ended with his acceptance, on new terms, of a dubious success in career and marriage.

Drama.—The year was not especially rich in new plays of high quality. In Edinburgh, Christopher Fry's *Curtmantle*, an historical drama dealing with the reign of Henry II, had its first English production. Written in a less spectacularly decorative style than his earlier plays, it did not succeed in giving vitality to any save its central figure, the king. At the Royal Court, John Osborne's *Plays for England* included *The Blood of the Bambergs*, a tasteless treatment of the marriage of a princess and a commoner, and *Under Plain Cover*, a fantastic, if repellent, comedy of a man and a woman who cooperate in the expression of their sado-masochistic neuroses.

Harold Pinter's *The Collection*, which had already been presented on radio and television, proved far less effective than *The Caretaker* (1960) in its treatment of the relations between a man and his wife and a dress designer and his lower-class protégé. Doris Lessing's *Play with a Tiger*, dramatizing a situation already treated in her novel *The Golden Notebook*, studied the relationship between an Englishwoman bent on living a free life and her brash and unscrupulous American lover. Perhaps the best play of the year will prove to be Arnold Wesker's *Chips with Everything*, which presented a group of Royal Air Force conscripts and showed the triumph of class distinctions over a public-school youth who has attempted to escape them.

Poetry.—Ronald Bottrall and Roy Fuller each published his *Collected Poems*, in 1961 and 1962, respectively. The poetry of Bottrall, although acclaimed by such critics as Dame Edith Sitwell and F. R. Leavis, struck others as technically expert but too imitative of Pound, Auden, and Empson to claim individual distinction. The most effective poems by the poet-novelist Fuller were drawn from his experiences in service during World War II and not from his rather gray and resigned civilian life after the war.

My Sad Captains and Other Poems (1961), by Thom Gunn was widely noticed and generally admired. In this volume, the relatively opaque style of his early poems contrasted sharply with

the transparent style of his recent poems, which express a bleak nihilism not unrelated to the values espoused by west coast beatniks. Dame Edith Sitwell, in the pungent preface to her ten poems in *The Outcasts,* protested against the banishment of grandeur from contemporary poetry and maintained that poetry should be "the deification of reality." In this collection, with her now familiar force and skill, she treated the contrasted themes of the sense of loss and desolation in our times and the need for praising beauty and love and God.

Tares (1961), by the Welsh clergyman R. S. Thomas, reinforced the impressions his earlier volumes gave of simplicity, honesty, directness, and toughness in the representation of the harsh lives of his rural parishioners. By contrast, C. Day Lewis' *The Gate* seemed bookish and traditional in the unhappy sense of that term. In George Barker's *The View from the Blind I,* critics distinguished three such diverse strains as Swinburnean volubility, elegiac sensuousness, and a lightly mocking vein that did not exclude his view of himself; the two latter strains were fortunately dominant. Christopher Middleton's *Torse 3: Poems 1949–1961* exhibited skill in the creation of complex structures; and *The Early Drowned, and Other Poems* (1961), by Hilary Corke, expressed fastidiously a resigned hedonism.

Criticism.—In works on the theory of criticism, evidence was accumulating of a vigorous reaction on the one hand against the microscopic particularity of the New Critics and on the other hand against the aesthetic and moral dogmatism of F. R. Leavis and his numerous disciples. Thus, C. S. Lewis' *An Experiment in Criticism* (1961) maintained that a work of art can be either "received" or "used," and objected to the Leavis school on the grounds that it "used" literature for moral or psychological enlightenment; by "receiving" literature, Lewis meant opening one's mind and heart to it, and coming to understand it for its own sake and not for any ulterior end.

In a less argumentative vein, the late Edwin Muir in *The Estate of Poetry,* his Charles Eliot Norton lectures at Harvard, defined the New Criticism as "reading into a poem all sorts of probable or possible meanings apart from the clear and obvious one." From these currents and countercurrents of criticism, Robert Graves stood staunchly apart. In his *Oxford Addresses on Poetry,* he attacked recklessly poetry that seemed to be Apollonian and extolled idiosyncratically such Dionysian writers as Skelton, Wyatt, and Raleigh.

In applied criticism, Bernard Blackstone's *The Lost Travellers* ranged the most widely. Here he studied the variations on the journey, the quest-theme, in the major Romantic poets. A fresh and useful work was Bernard Bergonzi's *The Early H. G. Wells, a Study of the Scientific Romances.* By demonstrating the distinction of Wells' work in this increasingly popular if generally debased genre, he seemed to be preparing the way for the needed rehabilitation of a gifted and once immensely popular writer.

J. D. Beer's *The Achievement of E. M. Forster* and K. W. Gransden's *E. M. Forster,* though thoughtful and sometimes illuminating commentaries, failed to take sufficient account of the influence on Forster of his upbringing and his long association with the University of Cambridge or of the adverse criticisms that have become vocal in recent years. The two critical works that provoked the most intense discussion were William Empson's *Milton's God* (1961) and David Holbrook's *Llareggub Revisited: Dylan Thomas and the State of Modern Poetry.* The purpose of Empson's book was to demonstrate that Milton attempted but did not succeed in justifying the ways of a God whom Empson sees as the essence of "premeditated malignancy." Holbrook's attack on Dylan Thomas as a man and as a poet was so shrill and extravagant as to be self-defeating.

Biography and Autobiography.—On the whole, the biographies of the year seemed less intriguing but possibly of more enduring significance than the autobiographies. Dame Edith Sitwell, in *The Queens and the Hive,* completed the account of the life of Queen Elizabeth, whose history up to her accession she had narrated in *Fanfare for Elizabeth* (1946). Meriol Trevor's *Newman, the Pillar of the Cloud* was the first volume of what seems likely to prove the best modern biography of her great subject. Sharply antithetical to the personality and the triumphant career of Cardinal Newman were the personality and the sense of failure recounted in Lady Katherine Chorley's *Arthur Hugh Clough, the Uncommitted Mind.* Lady Chorley not only gave the best available history of his life, but speculated as to the reasons for his failure to achieve the greatness of which he was thought capable.

Three collections of letters proved invaluable as contributions to our knowledge of their writers. In *The Letters of Oscar Wilde,* impeccably edited by Rupert Hart-Davis, the assembly of 1,298 letters furnished more than adequate material for a much needed revaluation of this tragic figure. *The Collected Letters of D. H. Lawrence,* edited by Harry T. Moore, contained 300 unpublished letters but omitted hundreds that have appeared elsewhere. An all-important but also incomplete contribution to a knowledge of Lawrence was *Frieda Lawrence: the Memoirs and Correspondence* (1961), edited by E. W. Tedlock.

O Dreams, O Destinations, an Autobiography, by Phyllis Bentley, explored the abyss between the two main terms of her title. In *The Heart to Artemis: a Writer's Memoirs* by the pseudonymous Bryher, Winifred (Ellerman) Macpherson, was most communicative in her description of her childhood. Sir Osbert Sitwell's *Stories My Father Told Me, an Evocation of Extravagant Episodes* garnered reminiscences of his fantastic father, Sir George. Emlyn Williams' *George, an Early Autobiography* (1961) proved to be a moving if somewhat self-conscious narrative. The most widely noticed autobiography, Leonard Woolf's *Growing, an Autobiography of the Years 1904–1911* (1961) was a sequel to his early life in *Sowing . . .* (1960).

ESTONIA

The Estonian Soviet Socialist Republic, on the northeast coast of the Baltic Sea, has an area of 17,370 square miles; its population is 1,197,000 (1959), about 56% urban. In 1959, 73% of the population were Estonians, a Finno-Ugrian nationality; 22%, Russian; and the remaining 5%, mainly Finns, Ukrainians, Belorussians, and Jews. Chief cities and their populations are: Tallinn (Reval), the capital, 280,000 (1959); Tartu (Dorpat), 74,000 (1959); and Pärnu, 36,300 (1956).

Government.—An independent republic since 1918, Estonia was forcibly annexed by the USSR in 1940, and reoccupied near the end of World War II. The United States does not recognize this annexation. The Estonian legislature is a unicameral Soviet elected for four-year terms. It rarely meets and, in the interim, delegates its authority to an 8-man Presidium headed by Aleksey A. Myurisep and to a Council of Ministers (cabinet) headed by Premier Valter I. Klauson. The Estonian government has no political autonomy, and merely executes orders from Moscow. All key government posts are held by members of the Estonian Communist Party, which is headed by First Secretary Johannes G. Kebin.

Education and Religion.—School enrollment, 1961–62: 170,000 in grade schools, 33,700 in high schools, and 11,000 in technical high schools and colleges. Number of scientific research institutes: 24. Principal religion: Lutheran.

Finance.—The 1962 state budget: expenditures, 340,596,000 new rubles (U.S.$378,061,560), an increase of 19,530,000 rubles over 1961.

Transportation and Communications.—Transport networks (miles): main railways, 905; secondary rail lines, 433; roads, 10,900; paved roads, 1,000. Airlines serve Moscow, Leningrad, and Riga. The main seaport is Tallinn. Telephones number 36,200; radio receivers, 300,000.

Manufactures and Minerals.—Important industrial products (metric tons, 1961): oil-bearing shale, 10,300,000; cellulose, 103,500; paper, 94,400; steel, about 4,000; chemical fertilizer, over 405,000; cotton textiles, over 114,000,000 meters; electric power, 2.9 billion kw.-hr. Chief manufactures: natural gas (from oil shale), electrical machines, farm machines, superphosphate fertilizer, construction materials, and textiles. Planned industrial expansion during 1962 (percentage over 1961): electric power, 33; machine building, 18; building materials, 16; all industry, 9.

Agriculture.—Major agricultural products (metric tons, 1961): grain, 358,000; milk, 820,000; meat, 96,000; butter, 15,400; fish, 85,800. Area under crops: about 1,830,000 acres, mostly planted to grain, hay, potatoes, and flax. Approximate number of livestock: cattle, 452,000; sheep and goats, 260,000; horses, 65,000. Number of farm tractors, 7,950. Farm ownership is divided among 679 collective farms and 155 state farms.

Foreign Trade.—Most Estonian trade is with the remainder of the USSR. Principal exports (1962): butter, meat, bacon, canned fish, electrical apparatus, cloth, furniture. Principal imports: grain, coal, petroleum, ferrous metals, timber.

Events, 1962.—The official campaign against embezzling by state employees resulted in April in the execution at Tallinn seaport of a female cashier who had headed a group of thieves who stole 70,000 rubles from government offices. The Communist press, as before, indicated that much political unrest exists in Estonia, with many Estonians clinging to their traditional desire for national independence, fondness for private farming, pro-Westernism, and pro-Germanism.

ELLSWORTH RAYMOND,
USSR Area Specialist and Associate Professor of Government, New York University.

ETHIOPIA

The Empire of Ethiopia (or Abyssinia) is located in northeastern Africa and is bounded by the Red Sea, Sudan, Somalia, and British East Africa. The total area, including Eritrea (federated with Ethiopia in 1952 as an autonomous unit under the Ethiopian crown), is estimated at 480,000 square miles. The land consists chiefly of vast tablelands and plateau regions with a few high, rugged mountain chains.

Ethiopia's population is estimated (mid-1959) at 21,800,000. The principal cities and populations (1961 est.) are Addis Ababa, the capital, 449,000; Asmara, capital of Eritrea, 120,000; Dessie, 40,000; Dire Dawa, 40,000; and Massawa, 25,000.

Amharic is the national language, but English, Italian, and French are common among commercial people. The Amharas (who supply the ruling family and most of the senior officials) and the Tigreans, two groups of Semitic and probably Hamitic descent, constitute one third of the population. The Hamitic Gallas constitute 40% of the population. The largest foreign group, estimated at 50,000, is of Arab origin, mostly from Yemen. There are also Italian, Indian, Armenian, and Greek communities.

Government.—Emperor Haile Selassie I (b. 1891), crowned king in 1928 and emperor in 1930, rules virtually as an absolute monarch. Under the 1955 constitution, a Council of Ministers is partially responsible to Parliament, which consists of two houses, the House of Deputies (210 members, popularly elected) and the Senate (appointed by the emperor, with a membership not exceeding half the number of deputies). The emperor retains veto power over legislation; the House of Deputies has a role in fiscal affairs. Ethiopia proper is divided into provinces, each ruled by a governor appointed by the emperor. Eritrea, governed by a chief executive chosen by a popularly elected assembly, is represented in the Ethiopian Parliament. A number of non-Ethiopian advisers, mainly from the United States and Great Britain, assist in the work of the ministries.

Education and Religion.—School facilities are available for only about 6% of the 3,200,000 school-age population. Over 90% of the population is illiterate; however, the number of school children is steadily increasing, and a considerable number of students are being sent abroad for advanced study. There were 186,810 students enrolled in government schools in 1960–61. Haile Selassie I University was established in December 1961, incorporating six separate previously established colleges. The Ethiopian Orthodox Church, a Christian communion allied with the Coptic Church, is the established church. Muslims are probably as numerous as the Ethiopian Orthodox Christians. From 5 to 15% of the population is pagan.

Finance.—Government revenue, 1961–62 est.: Eth.$162.0 million (Eth.$196.8 million in 1960–61); ordinary expenditure, Eth.$197,274,830 (Eth.$190.9 million in 1960–61); and capital expenditure, Eth.$123,147,450. The 1962–63 budget called for ordinary expenditures of Eth.$209,068,796 and capital expenditures of Eth.$77,999,987. The main capital expenditures budgeted are civil aviation (Eth.$52,650,000), highways (Eth.$7,421,317), and industry (Eth.$11,578,000). The Ethiopian dollar equals U.S.$0.40. Foreign exchange reserves: Eth.$180.2 million as of June 2, 1962.

Transportation and Communications.—Ethiopia has about 3,000 miles of all-weather roads and 6,000 miles of roads passable in the dry season. The 487-mile Addis Ababa-Djibouti (Somaliland) railroad runs for 421 miles in Ethiopian territory. The Massawa-Agordat railroad in Eritrea totals 191 miles. The government-owned Ethiopian Airlines (operated by Trans-World Airlines) provides domestic and international service. Motor vehicles, 25,175 (1961); telephones, 12,012 (1960); radio receivers, 85,000 (1959).

Manufactures and Minerals.—Industrial production is confined almost entirely to the processing of agricultural commodities. A few consumer items are produced, as well as bricks, salt, flour, beer, textiles, shoes, soap, and tobacco products. Mineral production includes only gold (41,500 troy ounces in 1961) and, platinum. A United States firm has been given a concession for potash production.

Agriculture.—The country is virtually self-sufficient in agricultural produce except for cotton. Over 90% of the population is engaged in agricultural production. Coffee, which grows wild, is Ethiopia's major product and provides one half of the country's foreign exchange; 1961 coffee production amounted to 66,000 metric tons (53,500 in 1960). Production of 70,000 tons was forecast for 1962. Other crops include teff (a bread grain), barley, wheat, corn, and durra.

Foreign Trade.—Total exports, 1961: Eth.$196.2 million (Eth.$192.6 million in 1960); imports, Eth.$231.2 million (Eth.$219.3 million). Estimates for 1962: exports, Eth.$231.2 million; imports, Eth.$234.0 million. Principal exports: coffee (58,500 metric tons in 1961), hides and skins, pulses, and oilseeds. Chief customers: the United States (receives nearly 50% of Ethiopia's exports), West Germany, the United Kingdom, and India. Principal suppliers: Japan and Italy.

Events, 1962.—The Empress Menen (b. 1891) died on February 15; Prince Sahle Selassie, the emperor's youngest son, died on April 23, at the age of 31.

In July, disturbances occurred in Eritrea, in apparent opposition to the federation with Ethiopia. The emperor accused foreign enemies of sowing the discord. A hand grenade thrown into a gathering being addressed by the emperor's personal representative killed eight persons. The Eritrean Assembly on November 14 voted to end Eritrea's federated status and for complete unification with Ethiopia (effective November 15).

In September, a U.S. Peace Corps contingent of 244 persons, the largest assigned to any country, arrived in Ethiopia to aid in education.

Gradual expansion of the economy continued during 1962. Plans were formulated for the second five-year plan (1963–67), which emphasizes development of agriculture and industry. Exchange and import controls were eased considerably in 1962. In October, the emperor announced that the government would submit to Parliament new legislation to reform feudal land tenure systems. Increasing foreign investment took place during the year.

EUROPE

Europe in 1962 continued to demonstrate that astonishingly renewed vigor and prosperity which have brought it back in recent years to the forefront of the world's stage. The European boom continued in its remarkably durable course, and economic activity was still increasing. Such broad generalizations, however, masked considerable variations from country to country, which ranged from an insignificant increase in Sweden to substantial gains in Italy and France. It was broadly true that a certain easing-off was discernible in the rate of improvement. This was due to an increasing

WIDE WORLD

labor shortage, fairly rapid rises in wage levels, and a consequent profit squeeze. At the same time the British economy, which had hitherto lagged behind those of Continental neighbors, began to show a brisk upturn beginning in June.

The long-continued boom was associated with the success of the European Economic Community (EEC) and the European Free Trade Association (EFTA), particularly the former. Moves toward the economic integration of Europe were showing new dynamic power. Yet the pattern of the future was not clear; throughout the year great decisions were pending which would shape the future of the continent for many decades ahead.

Specifically, still undecided was the question of British membership in EEC. If Britain joined, it could be presumed that through various kinds of links, all the EFTA members would follow, and there would be one great trading bloc in western Europe. There was considerable opposition in Britain to joining, however, and it was not clear that German Chancellor Adenauer and French President de Gaulle really wished for British membership. To them, Britain would be a formidable rival for the leadership of a united Europe; to the smaller states, she would be a welcome counterpoise to France and West Germany. The small states were eager to have a genuinely integrated western Europe, provided that it included Britain.

The French president's visit to Germany at the beginning of September was a notable landmark, seemingly signaling the end of the long era of Franco-German hostility. Yet its basis was not very strongly established, for it rested primarily on the personal *rapprochement* of two aged men who must soon in the course of nature relinquish control of their respective countries. West German politics might have a stable future, but the traditional instability of French politics was beginning in the fall to reassert itself.

The year also saw the first hostile reaction to EEC on the part of the Soviet Union. Despite the fact that the Common Market, as an example of private enterprise at its most successful and of international cooperation, is a fundamental refutation of Communist ideology, Soviet reaction has been laggard. It began with a speech by Soviet Premier Khrushchev on May 30 and was followed in June by a conference which attempted to breathe more life into the trading organization of Communist states (Comecon). (See also COMMUNISM.)

Generally speaking, Europe was stable politically during the year, except for the trends noted in France and some increased unrest in the two Iberian dictatorships. But over the whole continent, as over the world, hung the possibility of disastrous developments arising out of the Berlin question, a "European" question, but one in regard to which the policies of the United States and the Soviet Union will prove decisive.

POLITICAL ORGANIZATIONS

Council of Europe.—This 16-member consultative and parliamentary body, the oldest of the present European organizations, in 1962 pursued its normal course of providing intelligent commentary on the activities of Europe as a whole. As usual, the Consultative Assembly of the Council met three times in 1962 at Strasbourg, France. The third part of its 13th ordinary session, held on January 16–18, endorsed the "Freedom from Hunger" campaign of the Food and Agriculture Organization of the United Nations; stressed the urgency of the problem of international officials whose posts disappear due to changes in the structure of European organizations (this arose out of the transformation of the Organization for European Economic Cooperation into the Organization for Economic Cooperation and Development); expressed approval of recent developments in EEC; and instructed its economic committee to study the future development of trade relations between western Europe and the United States.

The first part of the 14th session, May 15–18, produced a strong recommendation on European economic and political integration, containing the significant clause: "The principle of unanimity must not be perpetuated." The session also approved a report urging greater standardization of equipment and procedures in European civil aviation. The second part of the 14th session, September 19–25, debated, among other general topics, proposed working relationships between the Council and OECD.

Switzerland, which began in 1961 to send a delegation of observers to the Consultative Assembly, moved nearer to membership in 1962. A resolution was introduced in the Swiss National Council on June 20 recommending that the Federal Assembly study the question of membership; reply was made for the government that it shared this view and would examine the compatibility of membership with the national constitution. Switzerland acceded to the European Cultural Convention during the year, and thus automatically be-

came a member of the Council for Cultural Cooperation (CCC).

The European Conference of Local Authorities held its 4th session at Strasbourg, March 21–24. This was the first meeting under the charter granted by the Council's Committee of Ministers.

The European Court of Human Rights (a creation of the Council) on February 22 re-elected as its president and vice president, for three-year terms, Lord McNair (United Kingdom) and René Cassin (France). Among other business, the court during the year finally struck the Raymond De Becker case from its court list (De Becker having withdrawn his charges against the Belgian government). It also refused to entertain appeals from Franz Isop (against Austria); Ilse Koch, widow of the commandant of Buchenwald (against Germany); and Gen. Raoul Salan (against France).

In a contested election on May 15, Per Federspiel (Denmark) was re-elected to serve a second year as president of the Consultative Assembly.

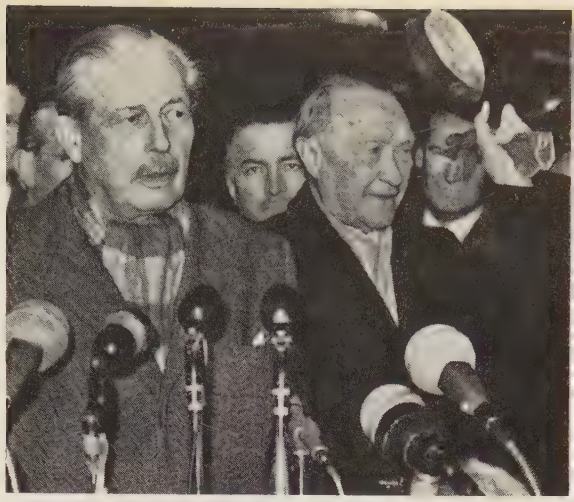
Western European Union.—At a meeting of the WEU Council in London on April 10, Edward Heath (United Kingdom), lord privy seal, spoke on the British attitude toward future European political integration. Arthur Conte (France) was re-elected president at the first part of the 8th ordinary session of the WEU Assembly, held in Paris, June 4–8. In addition to the usual reports on defense questions—which, in a strict sense, are the proper business of this particular organization—and one on European space programs, the Assembly debated general questions regarding the future pattern of Europe.

The Three Functional "Communities"

European Economic Community.—There were really two aspects to the history of the EEC (Common Market) in 1962—as of the other functional "communities," the European Coal and Steel Community, and the European Atomic Energy Community (Euratom). One was the continuation of their normal functioning and their degree of success in carrying out their purposes. The other was the negotiations which, if successful, will substantially enlarge their membership beyond the present six (common to all three communities), and thus greatly change their structure, as well as enhance their already great significance. The events of the year were such that the latter aspect almost overshadowed the former; but, of course, it is the success of their normal functioning that has generated on the part of nations yet outside the communities the desire to become members or associates.

The most important actual decision made by EEC during the year was the detailed agricultural policy finally adopted at 5:29 A.M. on Sunday, January 14, and dated retroactively to January 1. The agreement, which was achieved only after 200 hours of discussion in 45 working sessions, got the Community over the hump of the trickiest of all its problems. The new policy aims to balance supply and demand by greater regional specialization and an improvement of quality; and to stabilize agricultural markets and give a fair return to farmers, as well as a fair deal to consumers. The fundamental objective, of course, is that at the end of the transitional period (on Jan. 1, 1970) there shall be a full common market for agricultural products throughout the Community. The new regulations came into force on July 1, 1962, and 7½ years were therefore allowed for progressive introduction of the new policies, unless an acceleration is made.

The agricultural agreement permitted EEC to enter on the second four-year stage (1962–66) of the 12-year transitional period envisaged in the Treaty of Rome. Tariffs on trade in industrial goods were reduced a further 10 per cent on July 1, 1962, bringing the total cut since 1959 to 50 per cent. This is virtually a "point of no return" in the process of economic integration because (among other reasons) the earlier rule of unanimity in the decisions of the Council of Ministers gives way in the second stage to a veto-free system of decision-making by qualified majorities.



WIDE WORLD

In Bonn, West Germany, on January 8, British Prime Minister Macmillan (l.) is greeted by Chancellor Adenauer.

The economic health of EEC continued good in 1962. According to the quarterly report published by the EEC Commission in July, industrial production in the first quarter of 1962 rose by 5.5 per cent, as compared with 6.5 per cent in the first quarter of 1961. The expansion was "less vigorous" than hitherto, but was expected to reach a rate of 5.5 to 6 per cent over the whole year.

Negotiations of great difficulty and complexity were conducted throughout the year regarding the applications for membership or associate membership of no fewer than 11 states. The applicants for full membership are the United Kingdom, Norway, Denmark, and Ireland (the first three are NATO members, and Ireland cannot afford to let her economy go a separate way from that of Britain). Greece became an associate member on November 1, and Turkey, Spain, and Portugal have applied for associate membership as a transition to full membership later. Austria, Sweden, and Switzerland have submitted associate applications carefully hedged by qualifications about their neutral status.

The success of the Common Market is currently so great that the members are not prepared to purchase any country's accession by concessions. Thus it is clear that the hopes of Britain for concessions on Commonwealth trade, or of the neutrals for especially tender treatment, will evoke but minimal responses. The British negotiations were the clue to all the others. Sessions in May and August did not reach a decision before the Commonwealth conference in September, at which Britain's partners gloomily accepted her EEC membership as inevitable but signally failed to welcome it. The British negotiations resumed on October 8.

In March 1962 the European Parliamentary Assembly, consultative body of the three communities, adopted the new name of the European Parliament.

European Coal and Steel Community.—In 1962 the Coal and Steel Community, the oldest of the three, completed its 10th year of existence. In its 10th annual report, published in February, the

High Authority noted that the entry of the United Kingdom would raise annual coal production in ECSC to 400 million metric tons (greater than that of either the United States or the Soviet Union) and steel production to approximately 100 million metric tons (about the same as that of the United States and considerably greater than that of the Soviet Union).

The report, defining the general situation, stated that the internal demand for coal had reached its peak in 1956–57 and that there had since been a falling-off. The demand in 1961 was below that of the previous year. In steel there was still expansion but at a more modest rate, crude steel production rising in 1961 from 72.8 to 73.2 million metric tons. It was noted that in steel, since demand is no longer certain to outpace supply, greater efforts in regard to quality, costs, and marketing will be necessary. However, steel demand actually took a strong upward turn from February onward. (See also IRON AND STEEL.)

Among the major efforts of the High Authority in 1962 was the vast program of "readaptation" to resettle and re-employ coal workers whose jobs have been eliminated. Thus far the High Authority has set aside some $50 million for these general purposes. Although the Belgian mines (regarding which the coal crisis of 1959–60 arose) are the hardest hit, they are not the only ones so affected. On Jan. 18, 1962, new readaptation plans covering mines in the Ruhr were approved. On June 29, at the request of the French government, similar benefits were extended to miners in the Centre-Midi coalfields of France.

In the latter part of 1962 the High Authority was working on a new comprehensive energy blueprint for the Community.

European Atomic Energy Community.—On Jan. 10, 1962, Pierre Chatenet (France) became the third president of the Commission of the European Atomic Energy Community (Euratom), replacing Etienne Hirsch, who had held the office since Feb. 2, 1959. In addressing the European Parliament on February 20, M. Chatenet sketched the Community's second five-year research program, which will extend from 1963 through 1967 and will cost about $425 million (nearly double that of the first program, which in 1962 was some 95 per cent completed). President Chatenet said that the commission would strive to encourage European manufacture of fuel elements and to develop succeeding generations of reactor types already in operation.

The 5th general report of Euratom, covering April 1961—March 1962, noted that at the end of 1961 total installed nuclear capacity in the Community amounted to 73 megawatts of electric power, and that 270 million kw.-hr. of nuclear electricity was produced during the year. By the end of 1962 an additional 78 megawatts was to be added, and by the end of 1966 it was expected that nuclear sources would provide 2 per cent of all the electricity produced in the community. (See also ATOMIC ENERGY.)

OTHER ECONOMIC ORGANIZATIONS

European Free Trade Association.—While all the members of EFTA share the hope that the British negotiations with EEC will be successful and that all EFTA members will shortly enter into some category of relationship with the Common Market, their own organization has been going ahead successfully with its own plans in the confident expectation that these will ease the transition. On March 1, and again on Oct. 31, 1962, the tariffs of five EFTA member states on goods covered by the agreement were reduced ahead of schedule, each time by a further 10 per cent, making a total reduction of 50 per cent since July 1, 1960. Austria and Norway were to conform to the new rates later on. External trade of EFTA nations has generally kept pace with the world expansion, but the rate of increase in their mutual trade has approximately doubled.

Organization for Economic Cooperation and Development.—OECD, which became the successor agency to the Organization for European Economic Development (OEEC) on Sept. 30, 1961, continued its plans for extending the benefits of cooperation and technology to underdeveloped parts of the world. The Technical Cooperation Committee met for the first time in March 1962, and paid special attention to technical assistance programs for Greece, Iceland, Spain, Turkey, and Yugoslavia. Various projects which will concern more than one country also were studied, such as promotion of education in agriculture, improved marketing of fruits and vegetables, and training of personnel in research. In August, two consortia were set up to aid Greece and Turkey.

European Monetary Agreement.—EMA is the successor agency to the European Payments Union, which it replaced in December 1958, and is subordinate to OECD. The reports of EMA in 1962 chiefly noted the satisfactory state of affairs that the "normal" method of international payments through the exchange markets is now becoming more and more the prevailing one, and that therefore the net amounts which remain to be settled in dollar payments through the special operations of the agreement are steadily diminishing. Aid to Greece and Turkey to further economic development, from the consortia set up in 1962, will be largely handled by the European Fund of EMA.

EXCHANGE RATES

The general movement toward greater international cooperation in maintaining stability in foreign exchange markets was an outstanding feature of 1962. Common measures to protect the exchange value of major currencies took a variety of forms, including larger official intervention in forward exchange markets by central banks and treasuries, arrangements between national monetary authorities for short-term credits, and the provision of additional resources to the International Monetary Fund (IMF).

In 1961, for the first time in over 20 years, the United States had resumed foreign exchange operations in support of the dollar and to supplement actions taken to halt the sizable drains upon its gold reserves. The resources to carry out such operations were substantially enlarged in February 1962 when the Federal Reserve Bank of New York was authorized to engage in open-market operations in foreign currencies as agent for the U.S. Treasury and the Federal Reserve System. In the next six months a series of reciprocal credit, or swap, facilities amounting to $700 million were negotiated with seven foreign central banks and the Bank for International Settlements. Under these arrangements, the participating central bank agrees to exchange (swap) its own currency for the currency of the other party up to a stated amount over a limited period of time, for use in exchange transactions.

On May 2, 1962, Canada established a new par value of 1.081 Canadian dollars per U.S. dollar, replacing the 12-year-old, fluctuating exchange rate system. However, doubts regarding the tenability of the new parity, along with speculative pressures, resulted in large outflows of short-term funds and the exchange rate tended to fall. The Canadian authorities acted decisively to defend the new parity, adopting a number of measures designed to improve the country's international

payments position. On June 24, 1962, international assistance totaling $1,050 million was made available to Canada in the form of a drawing on the IMF equivalent to $300 million in various European currencies, a $400 million line of credit with the Export-Import Bank of Washington, and reciprocal credit facilities with the Federal Reserve System for $250 million and with the Bank of England for $100 million.

On Oct. 24, 1962, the new borrowing arrangements of the IMF came into force. Under these arrangements, 10 leading industrial countries (Belgium, Canada, France, Germany, Italy, Japan, the Netherlands, Sweden, the United Kingdom, and the United States) undertake to provide the IMF, in case of need, with supplementary resources amounting to the equivalent of 6 billion U.S. dollars. These additional resources will better equip the IMF to deal with possible disturbance of the internal monetary system arising from large-scale movements of funds.

Since October 1961, initial or new par values were established by Canada, Cyprus, Israel, Malaya, and Portugal.

FAIRS AND EXHIBITIONS

The following article reviews major fairs and exhibitions in 1962 under two headings: (1) Agricultural Fairs; and (2) International Trade Fairs. For a reference guide to related subjects, see the Index entry, *Shows*.

AGRICULTURAL FAIRS

In recent years the International Association of Fairs and Expositions (IAFE) has strongly demonstrated its value not only to member fairs but also to hundreds of nonmembers. At the regional meetings of the IAFE and at the annual convention each November in Chicago, every phase of fair management is discussed and evaluated. These discussions are closely followed by all fair managers, who receive workable suggestions for improving their own annual events. The beneficial results have been especially noticeable during the last three years. Hundreds of county fairs have followed the lead of the larger state and regional exhibitions in enlarging their grounds, providing additional exhibit space, and augmenting their entertainment features.

Not all fairs are able to pay their own way, but most of the more than 2,500 such annual events in the United States and Canada gross sufficient revenue from admissions, grandstand shows, and sale of exhibit space to cover the cost of operation, and many show a substantial profit.

Attendance at agricultural fairs in 1962 compared favorably with the previous year, which was exceptionally good. For the last ten years the two largest fairs on the North American continent—the Canadian National Exhibition, Toronto, Ontario, and the State Fair of Texas, Dallas—have been steadily climbing toward the 3 million mark in attendance. In 1962 the CNE passed that figure by about 10,000, but 4 inches of rain at Dallas in the first week killed the fair's chances for a record attendance, and the final figure was slightly over 2,780,000.

Over or close to the million mark were the Michigan State Fair, Detroit; Minnesota State Fair, St. Paul; Los Angeles County Fair, Pomona, Calif.; and Pacific National Exhibition, Vancouver, British Columbia. The Ohio State Fair, Columbus, attracted 321,000 persons despite several rainy days. The New York State Fair, Syracuse, drew 468,000. The Wisconsin State Fair, West Allis, hit by heavy rains, dropped to 784,000. Among the free fairs (no admission charge) the Allegheny County Fair, Pittsburgh, Pa., had an estimated attendance of nearly 700,000, and the Ionia (Mich.) Free Fair, 475,000. In Canada, the Calgary (Alberta) Exhibition and Stampede drew 567,000; Regina (Saskatchewan) Provincial Exhibition, 235,000; and the Trois Rivières (Quebec) Exhibition, 100,000.

In line with growing patronage, more than 200 county fairs took steps in 1962 to enlarge their grounds and construct new buildings. Hundreds of other fairs, large and small, completed improvements costing in the aggregate millions of dollars. At the Kansas State Fair, Hutchinson, a new industrial exhibits building was one of many improvements. The New Mexico State Fair, Albuquerque, has a new half-million dollar grandstand in operation, and other improvements are planned. The Los Angeles County Fair, Pomona, Calif., completed its million-dollar livestock building, which includes five new horse barns. At the CNE, Toronto, the $3 million Better Living Center, under construction for two years, was placed in operation.

NAT GREEN,
Former Manager, Chicago Office, Ringling Bros.-Barnum & Bailey Combined Shows, Inc.

INTERNATIONAL TRADE FAIRS

More than 70 million persons on both sides of the Iron Curtain have seen displays and demonstrations of United States products and technology sponsored by the U.S. Department of Commerce at international trade fairs. Between 1954 and 1962 the United States sponsored 127 exhibitions at such fairs in 38 countries. These exhibitions, sponsored by the Commerce Department's Office of International Trade Promotion, have resulted in millions of dollars of on-the-spot sales for American firms, and have often encouraged United States firms to sell regularly in worldwide markets, thus crediting the United States balance of payments.

Official United States exhibitions abroad are tailored to the needs and aspirations of the host countries. At the 1962 Tripoli International Trade Fair, for example, American irrigation and desalinization equipment suited to the Libyan economy was prominently displayed and sold. At the 1962 Third Central African Trade Fair, at Bulawayo, Southern Rhodesia, the United States exhibition featured copper products, mainstays of the Rhodesian economy, and American woodworking equipment. At the German Industries Fair in West Berlin, American machinery demonstrated the latest automation techniques as a solution to a growing labor shortage in the divided city.

Highlights of exhibitions staged by OITF in 1962 included the appearance of Vice President Lyndon B. Johnson, during his goodwill trip to the Middle East, at the American pavilions at international trade fairs in Izmir, Turkey, and Thessalonike, Greece. Postmaster General J. Edward Day was the official United States representative at Japan's Fifth Osaka International Trade Fair.

United States exhibitions were staged for the first time in 1962 at international trade fairs in

Tripoli, Libya; Bulawayo, Southern Rhodesia; Brno, Czechoslovakia; and Lagos, Nigeria. The United States also staged exhibitions in San Salvador, El Salvador, and Buenos Aires, Argentina (the first official American appearances at trade fairs in those countries), and in Djakarta, Indonesia.

The United States also participated in international trade fairs in Osaka, Japan; Casablanca, Morocco; Poznan, Poland; Damascus, Syria; Zagreb, Yugoslavia; Plovdiv, Bulgaria; and Karachi, Pakistan.

DEAN SMITH,
Director, Office of Publications and Information, Bureau of International Commerce, U.S. Department of Commerce.

FALKLAND ISLANDS

A British crown colony in the South Atlantic, the Falkland Islands consist of East Falkland and West Falkland, with adjacent islands. The colony (excluding dependencies) has an area of 4,618 square miles, and a population (1962 census) of 2,127, mainly of British descent with some Scandinavian strains. English is the spoken language, and Anglicanism is the principal faith. Stanley (1962 pop., 1,072), on East Falkland, is the capital and chief settlement.

The colony is administered by a governor (Sir Edwin Arrowsmith, appointed on Jan. 21, 1957), who is assisted by an 8-member Executive Council and an 11-member Legislative Council, 4 members of whom are elected. Government revenue in 1960–61 totaled £266,586; expenditure, £275,178. Compulsory education is provided in Stanley; 314 pupils were enrolled in 1961. There were 504 radios and 1 radio station in 1961.

Production of wool, the chief industry, totaled 4,800,000 pounds in 1961 (4,500,000 in 1960). Total imports for 1961 were valued at £1,540,000 (£1,570,000 in 1960); exports, £2,600,000 (£4,210,000). Argentina claims jurisdiction over the Falkland Islands, which it calls Islas Malvinas.

Falkland Islands Dependencies.—Administered by the Falkland Islands since 1908, the Falkland Islands Dependencies consist of South Georgia (area, 1,450 square miles) and the South Sandwich Islands (130 square miles). In March 1962 the Falkland Islands Dependencies south of latitude 60°S. were constituted as a separate British colony (see BRITISH ANTARCTIC TERRITORY). South Georgia (1961 pop., 521) is the center for the Antarctic whaling industry, which produces most of the world's whale oil (337,900 tons in 1961–62).

FAR EAST

One of the most significant themes in the Far East in 1962 was provided by the problems, policies, ambitions, and aggressions of Communist China. This was not a surprising fact, but rather one inherent and inescapable, having regard to the enormous preponderance in both population and area of China within the region, and to its central location.

Chinese Problems and Policies.—China might and did constitute a military threat to her neighbors, but her economy certainly could not be said to provide any convincing example of the professed merits of communism. At the three-week meeting of the National People's Congress in Peking in April 1962, China's present rulers came as close as they dared to a public admission of failure. The grandiose claims and plans of the economic "great leap forward" of 1958 and 1959 are for the moment a thing of the past. More modest plans for the future reversed the old policy of giving a priority to heavy industry, and looked instead to a "balance" which would seek to build up agriculture as a base before again aiming at industrial expansion.

The sheer difficulty of feeding the Chinese population undoubtedly contributed to the fact that birth control became respectable again in the summer of 1962, thus reverting to the earlier policy which prevailed from 1954 until 1958, before Mao Tse-tung proclaimed that China's enormous and growing population was its greatest asset.

The formidable internal difficulties of the Chinese Communists, however, seemed to do little to make them better neighbors to other nations, or better partners to the Soviet Union. Indeed,

FAR EAST

Major developments in the Far East in 1962 included the Chinese invasion of India, continuation of the guerrilla warfare in South Vietnam, political instability in Laos, and the transfer of West New Guinea's administration from the Netherlands to the United Nations, pending Indonesia's assuming control in 1963.

AMERICANA MAP BY DONALD T. PITCHER

the fact that the Communist regime in China managed to survive its economic disasters without any significant help at all from the Soviet Union has left the Chinese leaders with a feeling of grim resentment toward their allies. This was the interpretation that experts gave to a series of documents which became available in October 1962. The incipient cleavage with the Soviet Union in matters of world policy, which has been noticeable for several years, is thus deepening and becoming more absolute. The Chinese seem more than ever likely to follow a "hard" line in foreign policy, in contrast to the recent Soviet argument that economic tasks must take precedence over political tasks. In a speech on September 30, Chou En-lai declared that nothing would cause China to alter its "just stand" in international affairs, presumably a reaffirmation of readiness to wage war. The speech was made at a celebration of the 13th anniversary of the Chinese Communist victory, which no Soviet official of any importance attended.

China-India Hostilities.—It was Chinese policy that led to the only eruption of open war in the region during the year (apart, that is, from continuing guerrilla struggles). For some years there had been frontier clashes in the highly mountainous regions that constitute the 1,600-mile-long frontier of India and China. These had occurred both at the western end of the border (in Ladakh, a part of Indian-held Kashmir) and at the eastern end, in the North-East Frontier Agency. In the latter, the frontier is the McMahon Line, fixed by a British negotiator in 1914, but repudiated since then by Chinese governments. In October 1962, long-continued but minor Chinese incursions across the Indian frontier gave way in both places to something much larger and more dangerously aggressive, as Chinese troops beat back Indian resistance and advanced fairly considerable distances into Indian territory. An ambiguous cease-fire came into being on Chinese initiative at the beginning of December.

Thus was demonstrated the total bankruptcy of India's foreign policy toward China, including the great pretense to have discovered in the *Pancha Sila,* or Five Principles of Coexistence, new foundations for foreign policy superior to any traditionally known. Over the past decade and a half, India had, in practice, behaved much like any other state. When it felt strong enough to act with hope of success, it had done so; when afraid to oppose a powerful potential foe, it had found specious reasons for a policy of appeasement; but —as had happened before in analogous situations —in the end it was forced to defend itself.

The situation was deadly serious for India, and an embarrassing one for Prime Minister Nehru and his defense minister, V. K. Krishna Menon (whose will to oppose China had always been in doubt, and who was first downgraded to defense production minister on October 31 and then dismissed). It was scarcely less embarrassing to the USSR, who saw her Communist partner embroiled in a frontier war with her neutralist friend. So far as China was concerned, the rationale of the undertaking was obscure. It was difficult to believe that China wanted to rule any large area of India, considering her problems at home, and there was speculation that the move was intended to divert attention from the home front, or to gain control of the south slope of the Himalayas to facilitate some future advance.

Pakistan was a *tertius gaudens* in the China-India fighting. She had her own frontier troubles with India, and claimed repeatedly that Indian troops had crossed the frontier in the Chittagong hill tracts (East Pakistan). Again, in the course of 1962, negotiations between China and Pakistan for a definitive demarcation of the frontier between Sinkiang-Vigur and that part of Kashmir held by Pakistan seemed to be going well. India, arguing that the whole of Kashmir is Indian national territory, regards such negotiations as illegal, and repudiates in advance any decision that may be reached. Western military aid to India caused a serious reconsideration in Pakistan of her hitherto consistently pro-Western policy.

Instability of Indochina.—The Communist threat to Indochina (using this rather ambiguous term to include the five states of Thailand, Laos, North Vietnam, South Vietnam, and Cambodia) remained a matter of intense concern to the United States, and to a lesser degree to all the rest of the free world. The threat came mostly in the form of guerrilla infiltration. The guerrillas were not all Chinese, but were armed and organized in China, and slipped across the unmarked borders from Szemao in China, or from North Vietnam. Large parts of Ngo Dinh Diem's South Vietnam were held, or terrorized, by Communists.

Since October 1961 the United States has been determined to protect South Vietnam at all costs, has poured in equipment, and has also put in some 8,000 troops under Gen. Paul D. Harkins to train and stiffen the South Vietnamese army. Some success attended these efforts in 1962, but the Communist Viet Cong foe is elusive, and quick results are not to be expected.

The concomitant of these serious efforts to hold South Vietnam was the fact that Laos was not expected to do more than remain shakily neutral, and might even be completely lost to the West. A treaty signed by 14 states at Geneva on July 23 brought to an end more than a year of negotiations and supposedly established Laotian independence and neutrality. It provided, among other things, for the withdrawal of all foreign troops after 75 days, but in the late fall the scanty information available raised reasonable doubt as to whether the Communists had in fact complied. Equally doubtful was the question of whether there was in being a single Laotian government.

U.S. Marines landed in Thailand in May and stayed there until August, when the Communist threat from neighboring Laos seemed to have diminished.

Minor Role of SEATO.—The Southeast Asia Treaty Organization (created in 1955 by the United States, Britain, France, Australia, New Zealand, the Philippines, Pakistan, and Thailand to establish the security of the area) has more and more retreated into the background of events. A group from the House Foreign Affairs Committee which toured the area in 1961 commented justly in its report (issued May 27, 1962) that SEATO "offers no security" to the nations of Southeast Asia. On July 16, President Macapagal (Philippines) advocated a reform of SEATO which would obviate the need for unanimous approval before action, and Premier Sarit Thanarat (Thailand), speaking on the eighth anniversary of the signing of the treaty (September 8), also urged the strengthening of SEATO.

Animosities and Ambitions in the Area.—One melancholy truth which events on the contemporary Far Eastern scene underlined repeatedly was that the withdrawal of Western imperialism from the area, now virtually complete, was far from meaning that national conflicts, ambitions, and rivalries would cease. The ambitions and interests of Western powers in the area merely have been replaced by indigenous rivalries and imperialisms, and the standard of international conduct is no whit higher than it was before. Perhaps the

first clear demonstration of this might be said to have occurred in 1947, in regard to Kashmir, but another striking example took place just before the end of 1961 (December 18–19) in the Indian seizure of Goa and other Portuguese territories.

In the earlier part of 1962, it appeared that Indonesian claims to Netherlands New Guinea might lead to war, but instead an agreement was made which transferred the area (now known as West New Guinea) from the Netherlands to United Nations custody on October 1—an interim stage—and then to Indonesia on May 1, 1963. The backward people of West New Guinea are quite distinct ethnically and in culture from the peoples of Indonesia. There was no case for handing them over to Indonesia beyond the fact that President Sukarno was prepared to create a good deal of tension, and possibly even fight, if he was not given the area.

No attempt was made in advance to ascertain whether the inhabitants wished to live under Indonesian rule. By any rational standards it was merely a case of transferring a dependent people from one imperial rule to another. Their new rulers are unlikely to be able to do a great deal for them in view of the fact that economic activity in Indonesia at the moment is estimated to be declining by 10 per cent per year.

Among other instances of animosities and imperialist designs within the area may be mentioned the historic enmity between Cambodia and both her neighbors Thailand and South Vietnam, which erupted more than once in 1962—complicated by the fact that Cambodia is neutral while the other two are Western allies. In the same general category falls the claim made in 1962 by the Philippines to annex (British) North Borneo. The general reaction at first was that this whole demand was absurd; but in view of the fate of West New Guinea, no territorial claim (especially if made by an independent nonwhite state at the expense of a colonial area) can be assumed to be completely in vain.

Some Grounds for Optimism.—In several countries of the area, although there was no spectacular deterioration, developments were on the whole unfavorable. South Korea became a little more authoritarian, Burma a little more anti-Western, and Ceylon a little more financially incompetent.

On the other side of the ledger, the new constitution of Pakistan, replacing that abrogated in 1958, and providing for a somewhat qualified democracy, entered into force on March 1, and was generally welcomed. Noteworthy also was the British plan to extend the independent Federation of Malaya by incorporating within it the neighboring insular areas (at present under British rule) of Brunei, Sarawak, and North Borneo, as well as the semi-independent city of Singapore. The new federation would be known as Malaysia. If all goes well it will come into existence in 1963, and will create a stable and anti-Communist government at the southeast tip of Asia. However, the revolt which broke out in Brunei on December 8 brought into question the feasibility of the plan.

FARM CREDIT SYSTEM. See FARM SERVICES.

FARM SERVICES

Mounting capital needs of United States farmers during 1962 brought increased demands on the various federal financial services which are available in addition to regular commercial credit. These special services include loans to farmers and their marketing, purchasing, and service cooperatives from the Farm Credit System; credit provided by the Farmers Home Administration

UPI

Indian students in New Delhi demonstrate on November 1 to protest violations of India's border by Communist Chinese.

and accompanied by technical farm-management advice; and long-term loans to rural electric cooperatives and telephone companies and cooperatives to expand and improve electric and telephone service in rural areas. Besides these special credit facilities, the Federal Crop Insurance Corporation assists farmers in many counties by all-risk insurance against crop losses caused by drought, flood, insects, and plant disease.

Farm Credit System.—On June 30, 1962, farmers and their marketing, purchasing, and service cooperatives were using a record $5.8 billion in loans from the Farm Credit System supervised by the Farm Credit Administration. This was an increase of $528 million, or 10.1%, over the previous year. The Farm Credit System loaned a record $4,763,822,000 to farmers and their cooperatives in the fiscal year 1962; this sum was $460 million, or 10.7%, more than in the fiscal year 1961.

The Farm Credit System is composed of more than 800 national farm loan associations and 12 federal banks—a completely farmer-owned farm mortgage credit system; 487 production credit associations and 12 federal intermediate credit banks—a system of operating credit for farmers; and 13 banks for cooperatives, which provide credit for farmers' cooperatives.

As of June 30, 1962, farmers and their cooperatives had increased their capital stock ownership in farm credit banks and associations to $447 million, or $46 million more than a year earlier. Since the end of the fiscal year 1957, capital stock owned by farmers and their cooperatives in the credit system has increased by $207 million.

The 12 federal land banks, as of June 30, 1962, had 381,000 loans to farmers outstanding,

India's Defense Minister Krishna Menon (left), Communist China's Foreign Minister Chen Yi (center), and Soviet Foreign Minister Gromyko drink toast at reception in Geneva, July 22, during meeting on Laos. Krishna Menon, an advocate of friendship with China, was dismissed in November.

WIDE WORLD

totaling $3 billion. This was 0.3% more in number and 8.8% more in amount than a year earlier.

Farmers' need for operating credit reached another new peak in 1962. The 487 production credit associations made loans totaling $3 billion during the fiscal year, an increase of 10.3% over the fiscal year 1961. As of June 30, 1962, 298,679 members of these associations had loans outstanding of $2 billion—a new record and an increase of 0.9% in members and 10% in amount over the preceding year. Membership in the associations totaled 524,752, an increase of 0.8% during the fiscal year. Farmer members owned all the stock in 475 associations, compared with 470 at the end of fiscal year 1961.

The 12 federal intermediate credit banks extended credit totaling $3.9 billion during the 1962 fiscal year, an increase of $346 million, or 9.8%, over 1961. Of this amount, $3.6 billion was extended to production credit associations.

Farmers' cooperatives borrowed $860 million from the 13 banks for cooperatives during the fiscal year 1962, or 13.6% more than in fiscal 1961. The number of loans, 2,057, was 3.5% more than in the previous year. The banks had $692 million in loans outstanding to 2,817 cooperatives on June 30, 1962, an increase of 16.5% in amount and 0.8% in number compared with the year before.

Rural Electrification Administration.—Since the start of REA's electric program in 1935, about $4.6 billion in long-term loans have enabled rural electric cooperatives and other local organizations to bring electric power to millions of rural homes, farmsteads, schools, churches, and commercial establishments. Loans amounting to $261.4 million were approved by the REA during the fiscal year 1962, $13.1 million less than in the previous year. As of June 30, 1962, electric loans had been made to 1,094 rural service organizations. These included 991 rural electric cooperatives, owned and operated by the members they served. REA borrowers are serving more than 5 million farms and other establishments in 46 states and Puerto Rico, serving about 20 million persons. Systems financed by REA serve more than half the electrified farms in the United States. By June 30, 1962, REA borrowers had repaid more than $1 billion in principal and more than $500 million in interest to the federal government.

The average monthly consumption of electricity on lines of REA borrowers increased to 489 kw.-hr. in the calendar year 1961, an increase of 4.7% over 1960 and about 5.5% more than in 1955.

During the fiscal year 1962, REA made the highest percentage of generation and transmission loans for any year of the REA program. These loans authorized additional generating capacity of 644,000 kw., bringing to 3.5 million kw. the total energy production capacity provided through REA financing.

By the end of the fiscal year 1962, about 1.3 million subscribers were using modern dial telephone service provided by REA-financed facilities. About 70% of United States farms had telephone service, compared with 38% when the program began in 1949.

During the fiscal year 1962, REA made telephone loans amounting to $92.2 million. Loans were made to 43 new borrowers, bringing the number of REA-financed telephone systems to 790. Of these, 576 are commercial companies and 214 are subscriber-owned cooperatives. The telephone program now reaches 1,750,000 subscribers, or more than 6½ million people, in 46 states and the Virgin Islands. As of June 30, 1962, telephone borrowers had paid REA over $81 million in principal and interest.

Farmers Home Administration.—Supervised agricultural credit services—credit accompanied by technical farm management advice—provided by the Farmers Home Administration (FHA) in 1962 was administered through 1,427 county offices, serving agricultural areas throughout the United States, Puerto Rico, and the Virgin Islands.

FHA made and insured loans totaling a record $637 million during the fiscal year 1962, 61% more than the previous record of $395.7 million in the fiscal year 1961. Principal and interest collecting during fiscal 1962 amounted to $336 million, compared with about $307 million in each of the two previous years. During the year, 205,000 families either received loans or used credit advanced in previous years, 12% more than in fiscal 1961. Approximately 22,000 borrowers repaid their loans in full during the year.

Operating loans totaling $275,360,000 were made to 74,741 farmers in the fiscal year 1962. Emergency loans totaling $63,340,000 were made to 20,891 farmers, enabling them to resume normal farming operations in the wake of droughts, floods, and other disasters.

Loans amounting to $96,428,000 for construction and repair of farm and rural houses and other essential farm buildings were made to 11,349 borrowers. Farm ownership loans for $183,008,000 were extended to 11,788 farmers to improve, enlarge and buy family farms, and to refinance debts. Of this amount, $143,008,000 was advanced through the insured loan program.

Water-development and soil-conservation loans totaling $15,878,000 were advanced to 953 farmers and 100 associations, serving about 5,400 persons. These loans are used mainly to develop irrigation and domestic water supply systems. Watershed-protection and flood-prevention loans totaling $3,332,000 were made to 21 organizations to protect and develop land and water resources in small watersheds during the fiscal year 1962.

During the fiscal year 1962 the insured real estate loan program was improved to encourage further participation of private lenders, and a new forestry loan program was inaugurated to stimulate better land use and timber production on suitable farm lands.

Federal Crop Insurance Corporation.—The corporation's all-risk insurance on money spent to produce crops was expanded further in 1962. New insurance plans for peas, potatoes, and peanuts were developed and placed in operation, and plans were made to add apples, cherries, and canning tomatoes to crops eligible for insurance in 1963.

The service potential was also expanded for the 13 crops previously insured—wheat, corn, cotton, soybeans, tobacco, rice, barley, oats, flax, citrus, grain sorghum, dry edible beans, and peaches. Action was taken by the corporation to extend insurance operations into 100 additional counties in 1962, the maximum expansion authorized by Congress for any crop year. This brought the number of counties in which federal crop insurance is available to 996. A further extension into 100 new counties was planned for the 1963 crop year. Contracts in force brought in premium income in 1962 estimated at about $22,500,000 for $350,000,000 of protection provided.

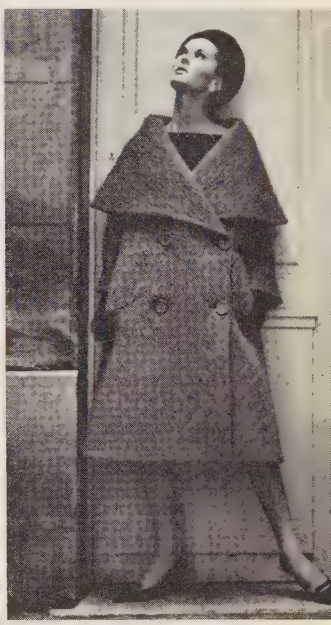
FARMERS HOME ADMINISTRATION. See FARM SERVICES.

FASHIONS

Fashion in 1962 was notable for the wide range of color, silhouette, and fabric presented by American designers. For every type, from the avant-garde to the ultrafashionable, a new free movement and femininity were expressed.

Consciousness of the figure was noticeable; clothes were molded and frankly clinging. Spring ushered in a little-girl look that was daringly provocative. Waists were tiny, sleeves long and tight, hiplines curved, and necklines plunging. Waistlines, the main theme in all collections, were high and gentle, sashed lightly, or cinched with wide belts. Jackets were short and clipped, while skirts whirled beneath in full circles, extravagantly gathered, or gored to near circles, minimizing the center of the figure. Deep cowl necklines, ruffled edges, fringes, and welt seamings were also featured.



OHRBACH'S OF NEW YORK; ANNE FOGARTY; OHRBACH'S OF NEW YORK

(*Left*) Dress with slashed neckline and folded skirt, from a design by St. Laurent, and (*right*) "A"-line coat with large cape collar, adapted from Simonetta-Fabiani, are American copies of European fashions. (*Center*) A gold-embroidered skirt created by Anne Fogarty, with a double-knit molded leotard top, illustrates the trend to separates for at-home evening wear.

By fall, three silhouettes emerged: a skinned-down, sleek, and tailored look; a bloused and wrapped look; and a new natural outline, achieved by a bias cut. Bloused or unbelted, the bias cut looked soft and ample, often constructed in an "A" line. Skirts were of every shape—slim, gathered, paneled, pleated, gored, flared, draped, circular, and yoked—and were even worn over other skirts. Interest was on the silhouette, with little trim except fur, self-detail, and braid. Lines were clean, although cut was sometimes complex. The dolman sleeve of spring was replaced by tailored or peaked set-in sleeves. Coats and jackets had straight, rather squared backs, with a fitted line at the front.

Color.—Like silhouette, color was feminine and mellow. Sugary pinks, salad greens, yellows, and candy colors were popular. For daytime wear, mellow neutrals were worn with flashes of blue, from marine to ice. Red, white, and blue punctuated combinations for morning, afternoon, and evening wear. Prints appeared predominantly in bold black and white and in tones of green. Silk prints appeared throughout the year, in "pretty" rather than bizarre designs. Resist prints were also popular. Black, particularly in silk, returned as the leading basic. Fall prints were rich, vivid, and strange; Picasso blues and greens, reds and oranges, odd browns, and black and white appeared in every fabric and most types of costume. Cashmere wool colors were bright, and spring and summer colors tinted winter-weight town-and-country clothes. Prominent were such out-of-season colors as pale green, sky blue, white, oyster, cream, dandelion yellow, and peppermint pink.

Fabrics.—American designers used fabric in new, exciting, and extravagant ways. Materials ranged from flat formal surfaces to lush piled yarns in a wild array of colors and patterns. Coats and suits for spring featured nubby textures, along with a variety of smooth-faced wools. Silk and wool Alaskine, usually a dressy fabric, was a daytime favorite. Four-ply black silk became as basic as black crepe or sheer wool for round-the-clock wear. The use of two patterns in one ensemble was featured in many collections; plaids were shown with prints and polka dots with stripes. The same pattern was often superimposed on printed silk chiffon over printed silk.

Cotton, wool, and synthetic knits, both domestic and imported, were available in every fashion category and price range. Synthetic stretch fabrics portended a new era in knit dresses and sportswear. Fall flannels and printed wools entered a growing circle of evening fabrics, designed in short and long lengths in evening and cocktail dresses, coats, and suits. A bulky look, light as air, flourished the year round, in mohairs, tweeds, brushed wools, bouclés, and puffy silk matelassé. Wide-ribbed silk ottomans, ribbonzine lace, fringed silk faille, ribbon knits, rich embroideries, and many other fabrics created surface values that became more important than texture. Velvet made a strong comeback in fall. Thick, lacy mohair ap-

peared in bare top dresses. Brocades, satins, and metallic knit clothes, luminous rather than shiny, were often dramatically combined with tweed or flannel. Plaids, checks, paisleys, and myriad gigantic flowers created the most patterned fall and winter fashions in years.

Sportswear.—In 1962, sportswear attained new influence and diversity. A new fashion category was at-home clothes, from lounging garments to extravagant boutique separates. The two-piece look of skirt and top flourished in both casual clothes and evening wear. Even sweaters were appropriate for evening dress when combined with long, luxurious skirts. Shirts were designed in lush, evening fabrics, as were slacks. Suede was used in every kind of coordinate, and stretch slacks and tops made their appearance in moderate priced markets. The short-short decreased in popularity, as the Jamaica length became popular. The bikini bathing suit was more popular than ever before, as was the one-piece bathing suit.

Accessories.—In 1962, accessories were as colorful as other apparel. This was especially true of shoes. The trend started in spring with a complete range of rainbow colors in patent, kid, suede, and fabric. Fall shoes featured lizard and snake skins in every color, including gold and silver. Heels were generally low and stacked, although the tiny slim heel of the previous year was still seen. There was a bare look in many shoes, with sides and backs exposed, and there was a new rounded shape to the toe. Boots, from knee to ankle length, made fashion news. Most were lined for warmth, and many were fitted and heeled like a shoe. In bright red, shiny black, or white, and in fur, zebra, pony, and lizard, they were as colorful as shoes.

Gloves tended most often to be in six- or eight-button lengths. Bags were diminutive, as compared with previous seasons, and more compact and trim. Colorful snake and lizard bags were designed to match shoes. Tapestry prints and bright colored kid were available at every price.

In jewelry, too, color was promoted. Beads hung around the neck in exciting color combinations and huge stones or long, narrow strands fell from the ears. The tasseled sautoir, with matching earrings, became fashionable, along with bangles, in many colors for summer and in gold and silver for fall and winter.

Hats were larger, and hair was piled higher. Big brimmed leghorns, bouffant berets, wide-brimmed rollers, and tall, deep cloches were important throughout the year.

Men's Fashion.—The trim, easy two-button suit was the important item in men's fashions for 1962. The look established by President Kennedy was as immediately popular as the Ivy League three-button suit was 10 years earlier. The two-button suit allowed more shoulder, more lapel, and more chest room, and exposed more shirt and tie. There was also a small, growing interest in the one-button suit jacket.

Classic suiting fabrics continued to be featured, such as worsteds, cotton and synthetic cords, sharkskins, mohairs, and iridescent blends. Camel became important for fall, while shetlands and rugged tweeds dominated the leisure-wear market. Gray flannel, out of fashion for five years, returned in more durable blends. The ski-look in country clothes was as outstanding in men's sportswear as in women's. Fur-trimmed collars and fur-lined semicasual coats, as well as suede and suede-trimmed jackets, were also popular in leisure clothes. Odd jackets continued in casual wear, with more prominent patterns.

Brown for town made a surprising comeback, often with subtle stripings of black, blue, or green. High-rising slip-on shoes with square toes and new wing tips were shown for casual as well as evening wear. Stripes were popular in shirts and ties. Hats with preshaped crowns or triangular convex forms and semicasual town hats in silk and velour made fashion news.

Awards.—The 20th annual Coty Fashion Critics' Award was presented on Sept. 27, 1962, to Donald Brooks, whose costumes for *No Strings* had won a New York Drama Critics Award. Halston, a milliner for Bergdorf Goodman, won a special award.

ANNE FOGARTY,
Fashion Designer.

FATS AND OILS

World production of fats and oils and oil-bearing materials apparently reached a new high in 1962, continuing the upward trend of the past decade. A slight decline in soybean production was more than balanced by record outputs of peanuts and cottonseed and the largest flaxseed output since 1956.

The United States, easily the largest producer and exporter of fats and oils, had its second biggest soybean crop—669 million bushels. This was 3% below the 1961 record of 693 million bushels, but 60% above average. American flaxseed production of 31.6 million bushels was almost 10 million bushels (45%) more than the drought-affected crop of 1961, but was still about 10% below average. Cottonseed output of about 6.1 million tons was 2% larger than in 1961, as well as the biggest crop since 1953. Peanut production was 1,786 million pounds, compared with 1,743 million in 1961 and the average of 1,538 million.

Lard output for the year ended Sept. 30, 1962, was estimated at 2,525 million pounds, up about 25 million from the preceding year. Estimated production of fats and oils during 1962 exceeded 18 billion pounds for the first time.

U. S. PRODUCTION OF FATS, OILS, AND OILSEEDS
(Calendar years; amounts in billion pounds)

	1952–54 average	1960	1961	1962 est.
Soybean oil	2.8	6.0	5.9	6.5
Cottonseed oil	1.9	1.8	1.8	1.9
Lard	2.5	2.6	2.5	2.5
Butter	1.2	1.2	1.3	1.3
Other food fats and oils	0.6	0.9	1.0	1.0
Tallow and grease	2.6	3.5	3.6	3.6
Fish and marine oil	0.1	0.2	0.2	0.2
Other inedible oils	0.7	0.5	0.5	0.5
Tall oil	0.3	0.8	0.8	0.9
Total	12.8	17.5	17.6	18.4

World output of soybeans for 1962 was estimated at about 1.1 billion bushels, 2% off the 1961 peak, but one fifth more than the 1955–59 average. Most of the decline was in the United States, with less significant decreases in Japan and probably in Communist China. Canada had a near record crop, and production increased somewhat in Brazil, Taiwan, and Indonesia.

World production of peanuts was forecast at a record 15.8 million short tons, 3% more than in 1961, and one sixth above 1955–59. A sharp increase in Argentina and a substantial gain in Communist China more than offset declining African production.

World flaxseed production was estimated at 133 million bushels, 14% above the low outturn of 1961 and 17% above average. World cottonseed production was estimated at a record 24.1 million tons, with the bulk of the increase provided by Egypt, Communist China, and the United States.

1962 PRODUCTION OF MAJOR OIL CROPS

	Soybeans	Flaxseed	Peanuts	Cottonseed
	(1,000 bushels)		(1,000 tons)	
United States	668,830	31,603	893	6,121
Canada	6,696	15,685	...	...
Mexico	...	...	...	984
China	330,000	...	2,600	3,920
India	...	15,641	5,200	2,352
Africa	...	...	4,509	2,235
Brazil	10,288	...	530	1,248
Argentina	...	35,000	477	...
World	1,080,950	132,920	15,831	24,115

World exports of fats and oils in 1962 were a record high of almost 9.3 million tons. The United States accounted for one third of these exports, 3.1 million tons.

Information Specialist, Office of Information, U.S. Department of Agriculture.

FAULKNER, William Harrison

U.S. author: b. New Albany, Miss., Sept. 25, 1897; d. Oxford, Miss., July 6, 1962.

"I believe that man will not merely endure: he will prevail. He is immortal, not because he alone among creatures has an inexhaustible voice,

but because he has a soul, a spirit capable of compassion and sacrifice and endurance. The poet's, the writer's, duty is to write about these things. It is his privilege to help man endure by lifting his heart, by reminding him of the courage and honor and hope and pride and compassion and pity and sacrifice which have been the glory of his past."

With these words, delivered on Dec. 10, 1950, as part of his Nobel Prize acceptance speech, William Faulkner, one of the great American novelists and, surely, the greatest 20th-century writer from the South, summarized his philosophy as man and artist. This philosophy is an apparent contradiction of Faulkner's creative purpose as novelist and short-story writer, for he portrayed—even, seemingly, was obsessed with—the evil in man's nature and the tragedy that results from that evil. However, as Granville Hicks wrote, Faulkner's work "contains much good as well as much evil, and we can begin to see now that the good predominates." Faulkner, in illuminating the depths of the human soul, casts light on the intensity and variety of man's emotions and the genius of his vision, as well as on his prodigal nature.

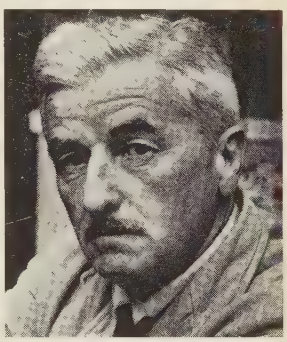
William Faulkner (originally, Falkner) was descended from the antebellum land-owning gentry of Mississippi. In childhood he moved with his family from New Albany to Oxford, the seat of the state university. After attending public schools, but not graduating from high school, he served during World War I in the British Royal Air Force. Returning to Oxford, where he spent most of his later life, he was a student at the university (1919–21) and university postmaster (1922–24).

In 1924 he brought out his first book, a volume of poetry entitled *The Marble Faun*. Moving then to New Orleans to work as a journalist, he met Sherwood Anderson, whom he credited as being "the father of all my works." Anderson assisted him in publishing his first novel, *Soldiers' Pay* (1925), which was shortly followed by others, including *The Sound and the Fury* (1929) and *As I Lay Dying* (1931). These novels, while greatly admired by a discerning group of readers, attracted little attention, and it was not until the publication of *Sanctuary* (1931) that Faulkner gained a measure of repute. According to its author, *Sanctuary*, a sensational tale of rape, violence, and degeneracy in the Deep South, was written only to make money.

Faulkner, however, was never a popular novelist, and, although he found a quickening interest in Europe, he was largely neglected by the American reading public. Increased recognition in the United States ("the Faulkner revival") followed the appearance in 1946 of *The Portable Faulkner*, a representative selection of his work, edited by Malcolm Cowley. He became a national figure when he won the 1949 Nobel Prize for "his powerful and artistically independent contribution to the American novel," and the 1954 Pulitzer Prize for *A Fable*, an allegorical treatment of the life, particularly the Passion, of Christ.

A Fable, as well as several earlier works, marked a departure from Faulkner's usual subject matter. By far the greater portion of his fiction is devoted to the region of Mississippi where he and his forebears lived and died. (In many of his books, beginning with *Sartoris*, published in 1929, Oxford is fictionalized as the town of Jefferson; Lafayette County, of which Oxford is the county seat, as Yoknapatawpha County.) Steeped in the tradition and heritage of this region, with an intimate knowledge of its denizens, rich and poor, white and Negro, he portrayed it in tragic, sometimes tragicomic, terms. In explaining his preoccupation with his home territory, Faulkner said (as quoted by Malcolm Cowley in *Writers at Work*, 1958), ". . . I discovered that my own little postage stamp of native soil was worth writing about and that I would never live long enough to exhaust it, and that by sublimating the actual into the apocryphal I would have complete liberty to use whatever talent I might have to its absolute top. It opened up a gold mine of other people, so I created a cosmos of my own. I can move these people around like God, not only in space but in time too." For Faulkner, Mississippi was the microcosm of the whole South, cursed by the scourge of antebellum slavery and left to rot in the aftermath of defeat; and for him the tragedy of the South was an extension and variation of the tragedy of all mankind.

Two major themes are threaded through Faulkner's fiction: first, the dissolution of the aristocracy, as personified by the Compson and Sartoris families; second, the rise of a materialistic, commercial oligarchy, as personified by the destructive, opportunistic Snopes clan. Feeding on the carrion of outworn values, lost pride, and degenerate moral-



William Faulkner (1897–1962)

WIDE WORLD

ity, the Snopeses rise to dominance, substituting their jackal philosophy for the moribund idealism of the old order. This subject is extensively treated in *The Hamlet* (1940), *The Town* (1957), and *The Mansion* (1959), which comprise a monumental trilogy that traces the Snopes family from 1908 through World War II.

Faulkner has been taken to task for his concentration on the morbid, grotesque, and depraved, on spiritual, mental, and physical deformity, on violence and death. He has also received critical disapproval for his frequently impenetrable, labyrinthine prose, liberally laden with interior monologues and sometimes written with deliberate disregard for place-time continuity. Nevertheless, his genius and the power of his insight cannot be controverted, and he stands as a major figure in modern literature, ranking with Ernest Hemingway as one of the greatest American writers of fiction of the post-World War I generation.

In addition to works cited, chief publications include *Mosquitoes* (1927), *Idyll in the Desert* (stories; 1931), *These Thirteen* (stories; 1931), *Light in August* (1932), *Absalom, Absalom!* (1936), *The Unvanquished* (1938), *The Wild Palms* (1939), *Go Down Moses, and Other Stories* (1942), *Intruder in the Dust* (1948), *Knight's Gambit* (stories; 1949), *Collected Stories of William Faulkner* (1950), *Requiem for a Nun* (1951), *Big Woods* (1955), *Three Famous Short Novels* (*Spotted Horses, Old Man,* and *The Bear;* 1958), *New Orleans Sketches* (1958), *Selected Short Stories* (1961), and *The Reivers* (1962).

FEDERAL AVIATION AGENCY. See AERONAUTICS.

FEDERAL BUREAU OF INVESTIGATION

The Federal Bureau of Investigation (FBI), established in 1908 as the investigative arm of the

U.S. Department of Justice, is charged with the investigation of violations of certain specific federal laws and the collection of evidence in such cases. As a fact-gathering and fact-reporting agency, the FBI neither evaluates the results of its investigations nor makes prosecutive recommendations. In 1962, the FBI had investigative jurisdiction over some 165 federal investigative matters, encompassing both general investigations and domestic intelligence operations. Such jurisdiction is derived from congressional enactments, executive orders, and rulings of the attorney general. In addition to investigative work, the FBI engages in cooperative functions designed to be of assistance to local, county, and state law enforcement agencies and to other agencies of the federal government.

Headquartered in Washington, D.C., the FBI has 55 field offices located in major cities throughout the United States and in Puerto Rico. Training facilities are located in Washington and on the U.S. Marine Corps Base at Quantico, Va.

Internal Security.—The FBI's work in the internal security field is nationwide. It embraces investigative jurisdiction over espionage, sabotage, treason, subversive activities, violations of the Atomic Energy Act, and related domestic intelligence functions.

During the course of the 1962 fiscal year, two men were convicted of espionage activities on behalf of the Soviet-bloc powers. In addition, intelligence and counterintelligence information disseminated by the FBI enabled the Department of State to take action against officials of the Soviet Union and its satellite states who engaged in activities beyond the scope of their duties in the United States.

Also during the year, as a result of the open defiance by the Communist Party, U.S.A., of the Supreme Court's ruling that it must register with the attorney general as an agent of the Soviet Union, indictments were returned against the party as an organization and against two of its top leaders for failure to comply with the Internal Security Act of 1950. (See also COMMUNISM.)

Crime Investigation.—Increases were recorded in all major phases of FBI accomplishments during the 1962 fiscal year. Fines, savings, and recoveries in FBI cases rose to an all-time high of $174,561,341. This sum represents a return of $1.37 for every dollar appropriated for the FBI in the year ending June 30, 1962. Included in the total savings and recoveries were 18,921 stolen motor vehicles recovered in FBI cases.

Convictions in cases investigated by the FBI totaled 12,635, the largest such total for any peacetime fiscal year. Convictions were recorded against 96.9% of all persons brought to trial; of these, 92.6% involved pleas of guilty. Prison sentences for a total of 37,100 years, plus six life sentences, were assessed, and fines amounting to $1,796,365 resulted from these convictions. In the fiscal year, 1,878 violators of the Fugitive Felon Act were apprehended. In all types of FBI cases, 11,163 fugitives were located, 1,228 more than in the preceding year. (See also CRIME.)

Cooperative Services.—The FBI continued its policy of providing cost-free cooperative services designed to assist local, county, and state law enforcement agencies and other agencies of the federal government in the more effective performance of their duties. During the 1962 fiscal year, the FBI Laboratory received 191,253 specimens of evidence requiring 231,456 scientific examinations.

Each working day throughout the fiscal year, the FBI Identification Division received an average of more than 23,000 fingerprint cards for processing—a total of 5,832,677 for the fiscal year. Fugitives identified through fingerprint comparisons totaled 17,568. At the close of the fiscal year, Identification Division files contained a total of 163,690,807 sets of fingerprints, representing an estimated 76,744,859 persons. FBI Disaster Squad fingerprint experts assisted in identifying victims at the scene of eight air crashes.

The FBI, upon request, participated in 3,666 local and regional police training schools attended by 101,865 officers in the 1962 fiscal year. Two sessions of the FBI National Academy were held in Washington, D.C., in the same period.

Over 100,000 items of criminal intelligence information, including data received from its confidential informants, were made available to other law enforcement agencies during the fiscal year 1962.

Other cooperative FBI services include the publication and distribution of pamphlets, charts, posters, and other printed materials dealing with the crime problem and law enforcement. The best known and most widely circulated of these publications are the *FBI Law Enforcement Bulletin* and the *Uniform Crime Reports* bulletin, both issued on a regular basis.

J. EDGAR HOOVER,
Director, Federal Bureau of Investigation.

FEDERAL COMMUNICATIONS COMMISSION

Established by the Communications Act of 1934, the Federal Communications Commission (FCC) regulates all interstate and foreign commerce in broadcasting and wire transmission in the United States. The first experimental active communications satellite—Telstar, launched on July 10, 1962—was operated under the terms of FCC authorizations, as were its associated receiving and transmitting stations in the United States. (See also SPACE FLIGHT.)

During 1962 the FCC also increased its efforts to require rule compliance by commercial broadcasters. For the first time, programming was a major factor in denying two applications for renewal of broadcast stations (four other licenses were either revoked or denied renewal during the fiscal year 1962). An FCC denial of an application for a new frequency modulation (FM) station in Elizabeth, N.J., on the grounds that no efforts had been made to ascertain the programming needs of the community it intended to serve was upheld by the U.S. Court of Appeals for the District of Columbia Circuit on March 29, 1962. In 1962 the FCC concluded taking testimony in an inquiry (in progress since 1959) into television network programming practices. Broadcasters were also warned about advertising practices and proper identification of the sponsors of programs.

Radio (General).—More than 3.7 million authorizations of all kinds had been granted by June 30, 1962. Of these, more than 2.5 million were commercial radio operators' and 230,000 were amateur operators' permits. The number of radio stations in the United States increased to about 955,600.

National Defense.—The CONELRAD (Control of Electromagnetic Radiation) system was altered on April 23, 1962, in accord with a Department of Defense determination that there was no longer need to curb the transmissions of most types of radio stations to prevent their navigational use by enemy airplanes and guided missiles.

International.—A telephone cable to Bermuda was opened during the year, and a similar cable linking the United States and Japan was expected to be completed in 1964. Permission was granted to extend to Panama and Colombia a cable now linking the United States and Jamaica.

Common Carriers.—The FCC continued in 1962 to investigate three new services offered by the Bell System: Telpak (a private-line multitype service), WATS (Wide Area Telephone Service), and WADS (Wide Area Data Service). Modifications in Bell's tariff system were approved, resulting in the transfer of about $45 million in annual revenue from intrastate to interstate operations, reducing intrastate rates in 31 states by $36 million a year.

Broadcast Services.—During the fiscal year 1962 the number of commercial television station authorizations in the United States increased from 650 to 654. The number of translators and boosters rose from 1,700 to 2,500. As of June 30, 1962, there were 548 commercial stations on the air—464 very high frequency (VHF) and 84 ultra high frequency (UHF). Noncommercial educational stations on the air totaled 64, of which 44 were VHF. A law signed by the president on July 10, 1962, required new television sets to be equipped for reception of UHF as well as VHF channels. The change-over date is April 30, 1964. There are 70 UHF channels, and only 12 VHF; the latter 12 carried the largest proportion of television transmissions.

Amplitude modulation (AM) radio station authorizations totaled nearly 3,900 by June 30, 1962; there were more than 3,700 stations on the air. FM station authorizations numbered 1,400, with 1,012 commercial stations and 201 noncommercial stations in operation.

Safety and Special Radio Services.—Some 930,000 radio users in more than 40 categories were licensed by the FCC at the end of the fiscal year 1962. The fastest growing category was the short-range vocal-transmission citizens service, for which almost 100,000 users were licensed during the fiscal year, bringing the total to more than 300,000. As of June 30, 1962, authorized radio stations included: amateur, 237,000; marine, 127,600; aviation, 107,000; industrial, 93,000; public safety, 38,600; and land transportation, 13,300.

Field Engineering and Monitoring.—In addition to its inspections of radio stations and its investigations of interference and other complaints, the FCC in 1962 helped to develop a transmitting antenna to assist direction-finding operations in locating space capsules floating on the sea after re-entering the earth's atmosphere. The commission's field staff also designed and constructed an improved wide-aperture radio direction finder.

FEDERAL POWER COMMISSION

The Federal Power Commission in 1962 adopted major new policies, made extensive staff reorganizations, and streamlined its procedures in a vigorous program to speed up the handling of its workload and to eliminate the backlog of cases which had been accumulating for nearly a decade. In late 1962, membership of the commission was as follows: Joseph C. Swidler, chairman; Lawrence J. O'Connor, Jr., vice chairman; and Howard Morgan, Charles R. Ross, and Harold C. Woodward.

Natural Gas Producer Regulation.—During the year the commission concentrated on its program to establish realistic price ceilings on gas sold from each of the nation's major producing areas. Proceedings to set fair rates for gas produced in the Permian Basin area of southwestern Texas and southeastern New Mexico were well advanced in the late summer of 1962. This case will serve as a model and will expedite future proceedings in other areas. In the fiscal year 1962, producers made 6,597 filings, which included 1,554 rate increases totaling $13,930,309 annually. Of these, 808 increases, amounting to $7,501,816, were suspended. Including the carryovers and the suspensions in 1962, there was a backlog on June 30, 1962, of $164,870,541, of which $159,402,190 was being collected subject to refund pending the commission's determination of the amount to be allowed, and $5,468,351 was still under suspension.

Pipeline Regulation.—The commission issued 79 certificates in the fiscal year 1962, authorizing more than 2,950 miles of gas pipeline and 247,000 compressor horsepower. This brought the total amount of pipeline and compressor horsepower authorized since 1942 to nearly 103,000 miles and 7,021,000 hp. The commission suspended wholesale gas rate increases totaling $24,477,400 during the year, which, added to previously undisposed of increases, left a total of $400,673,600 in suspended pipeline rates requiring action. Action was taken on $123,484,500 in annual rate increases during the year, $1,227,200 being withdrawn, $58,279,800 disallowed, and $63,977,500 accepted. As a result of its program to clear up past rate cases, refunds to consumers ordered by the commission by midyear totaled more than $153,000,000.

Electric Power.—The commission in 1962 initiated a national power survey to formulate an interconnected and coordinated power supply system for the nation for the 1970's and 1980's. The commission also acted on 121 applications relating to hydroelectric projects during the fiscal year ended June 30, 1962, licensing 1,366,545 kw. of new unconstructed capacity. At the end of the year there were 558 licenses outstanding, designed to provide 25,297,517 kw. of ultimate installed capacity. Total installed capacity of utility generating plants on June 30, 1962, was 186,005,596 kw. Industrial generating capacity was 17,878,349 kw. on the same date.

JOSEPH C. SWIDLER,
Chairman, Federal Power Commission.

FEDERAL RESERVE SYSTEM. See BANKING.

FEDERAL TRADE COMMISSION

The Federal Trade Commission, charged with keeping competition free and fair, in 1962 had the heaviest workload in its history. Many organizational and procedural changes adopted in 1961 were put into effect in 1962. Of special significance were increased efforts to secure industrywide compliance with the law, as opposed to proceedings against individual respondents. This necessitated a transformation on the part of the commission from a passive, prosecution-conscious view to the more affirmative goal of achieving maximum compliance with the law.

The commission adopted procedures, under the rule-making authority delegated to it by Congress, for the promulgation of trade regulation rules. These rules express the experience and judgment of the commission, and are based on facts of which it has knowledge, from various sources, or within its official notice, concerning the substantive requirements of the statutes it administers.[1] Another innovation was the adoption of procedures to assist businessmen in determining in advance whether a proposed course of action might violate any of the

[1] The FTC operates under two major statutes—the Federal Trade Commission Act and the Clayton Act, both of 1914—and others which include the Wool Products Labeling Act (1940), the Fur Products Labeling Act (1951), the Flammable Fabrics Act (1953), and the Textile Fiber Products Identification Act (1958).

laws administered by the commission or be likely to result in further commission action.

The commission also began the publication of *Advertising Alert,* containing a summary of complaints and orders in advertising cases, together with general warnings concerning misrepresentations in specific areas of current interest. This publication, which is distributed to radio and television stations, Better Business Bureaus, and other organizations, is designed to aid them in recognizing objectionable advertising practices.

In addition to its ten field offices in principal cities throughout the United States, the commission maintains field stations for the limited purpose of administering the Wool, Fur, Textile Products, and Flammable Fabrics Acts. Four additional field stations were opened in 1962—in Charlotte, N.C.; Denver, Colo.; Miami, Fla.; and Houston, Texas. Arrangements were made for each of the regional and branch offices of the Small Business Administration to receive and transmit to the commission complaints alleging violations of the laws administered by the commission.

During the fiscal year ending June 30, 1962, the commission approved 474 complaints and issued 407 orders to cease and desist. There were more than 2,800 investigations in progress at the end of the year. Actions by the commission ranged from orders requiring divestiture of properties acquired in violation of the antimerger law to orders enjoining camera trickery and spurious demonstrations of products on television commercials.

Commissioners during fiscal 1962 were Paul Rand Dixon, the chairman, and Sigurd Anderson, William C. Kern, Philip Elman, and A. Everette MacIntyre.

PAUL RAND DIXON,
Chairman, Federal Trade Commission.

FIJI

Lying in the central Pacific 3,183 miles southwest of Honolulu, this British crown colony comprises over 500 islands (106 inhabited), scattered over 95,000 square miles of ocean. Fiji has an aggregate land area of 7,055 square miles, including the dependency of Rotuma (18 square miles). The population was estimated (December 1961) at 413,872, including 205,068 Indians, 172,455 Fijians, 10,417 Europeans, 8,958 part-Europeans, and 5,039 Chinese. About 72% of the total population lives on the island of Viti Levu (area, 4,010 square miles), on which is situated Suva, the capital and chief port (1956 pop., 37,371).

The colony is administered by a governor (Sir Kenneth P. Maddocks, appointed Oct. 10, 1958), who is assisted by a 9-member Executive Council and a 33-member Legislative Council. The indigenous Fijian population has a large measure of self-government, operating through 76 district councils and 14 provincial councils. The Fijian Affairs Board and the Council of Chiefs advise the government on Fijian affairs.

Government revenue in 1961 totaled £F7,445,073; expenditure, £F7,412,694 (the Fiji pound equals approximately U.S.$2.54). In 1961 there were 544 primary schools (with 78,878 pupils), 58 postprimary schools (6,527 pupils), 2 teacher-training colleges, and a medical school. Road mileage totals 1,261, of which 917 are usable in all weathers; there are about 8,000 motor vehicles. Nandi International Airport handles jet aircraft for many major foreign airlines; Fiji Airlines operates internal service and flights to Tonga, the New Hebrides, and the Solomon Islands. There are 4 radio stations and 21,948 radios (1959). Telephones number 7,206 (1960).

Fiji is primarily an agricultural country, with a mineral extraction industry. The sugar (163,000 metric tons in 1961) and coconut industries account for 95% of all agricultural exports. Total exports in 1961 were valued at £F13,126,662; imports, £F17,186,548. Principal exports were unrefined sugar, £F5,943,757; coconut oil, £F2,039,132; gold, £F1,202,022; bananas, £F239,252; copra, £F337,746; manganese ore, £F15,994; and molasses, £F111,779. Great Britain, Australia, New Zealand, and Canada are the chief trading partners.

FINLAND

The Republic of Finland is situated in northern Europe. It has an area of 130,119 square miles, including the Aland Islands, and a population of 4,490,000 (Jan. 1, 1962, est.). Principal cities and populations (1962 est.): Helsinki, the capital, 467,371; Tampere, 129,300; and Turku, 127,300. Finnish (spoken by over 90% of the population) and Swedish (spoken by 7.4%) are the official languages.

Government.—Finland has been a republic since July 17, 1919. Its chief executive is President Urho K. Kekkonen (re-elected for a 6-year term on Feb. 15, 1962). A coalition cabinet (Council of State) of 15 members (formed April 13, 1962) is headed by Prime Minister Ahti Karjalainen (Agrarian Union). The unicameral Diet (Eduskunta) has 200 members, chosen for 4-year terms in direct and proportional elections. Political parties and number of seats held (following elections of Feb. 4–5, 1962): Agrarian, 53; People's Democrats (Communist-controlled), 47; Social Democratic, 38; Conservative, 32; Swedish People's, 14; Finnish People's (Liberals), 13; Social Democratic League (Socialist Opposition), 2; Liberal League, 1. (See below, *Events, 1962.*)

Education and Religion.—School enrollment, 1960: 792,571 (95% of the compulsory school-age population). Number of schools (with enrollments), 1960–61: 6,492 primary (625,968); 474 secondary (214,601); 542 secondary vocational (55,851); 11 teacher-training (1,601); 14 higher (23,552); 191 adult high schools and workers institutes (79,215). Principal religions: Lutheran (4,375,067 members) and Greek Orthodox (72,495), both state-supported.

Finance.—Government revenue 1961: 386,118 million markkaa (364,229 million in 1960); expenditure, 393,532 million (352,339 million). At par value, 320 markkaa equal U.S.$1. National debt: 146,110 million markkaa at the end of 1961 (139,013 million on Dec. 31, 1960). Gold and foreign exchange holdings of the Bank of Finland: 67,800 million markkaa as of Dec. 31, 1961 (up 3,300 million from a year earlier).

Transportation and Communications.—Transport network (miles, 1962): state-owned railways, 3,301 (none electrified); roads, 23,280 (1st and 2d class, 5,929); lock canals: 19. Merchant marine tonnage (July 31, 1962): 860,325. National airlines: Finnair and Kar-Air, carried a total of 543,000 passengers in 1961; Seutula, near Helsinki, is the principal airport. Other communications data, 1961: passenger cars, 216,921; trucks and buses, 82,952; telephones, 675,000 (1962); radio receivers, 1,227,559 (1960); television sets, 284,575 (1962).

Economic Indicators.—Gross national product: 1,706 billion markkaa in 1961 (up 6% from 1960). Index of industrial production (1954 = 100): 150 in 1961 (140 in 1960). Index of agricultural production (1948 = 100): 125 in 1961 (134 in 1960). Cost-of-living index (1951 = 100): 148 in July 1962 (142 on Dec. 31, 1961). The number of unemployed workers averaged 25,000 in 1961, or about 1.2% of the total labor force.

Manufactures.—Manufacturing accounts for 31% of the net national product and 26% of the labor force. Chief industrial products (metric tons, 1961): chemical pulp, 2,827,000 (up 14% from 1960); mechanical pulp, 162,000 (down 11%); newsprint, 914,000 (up 21%); sawn goods, 1,297,000 standards (down 5%); electric power, 10,207 million kw.-hr. (up 17%).

Agriculture.—Agriculture's share of the net national product is about 11% and engages 22% of the labor force. Chief crops (metric tons, 1961 est.) wheat, 460,792

(367,978 in 1960); rye, 126,719 (186,093); barley, 365,161 (440,128); oats, 941,020 (1,109,393); potatoes, 1,057,135 (1,716,678); sugar beets, 413,000 (411,000). Dairy and meat production (metric tons, 1961): meat, 117,388 (up 5%); butter, 92,171 (up 3%); cheese, 32,594 (up 6%); milk, 2,615 million liters (up 5%).

Foreign Trade.—Total exports, 1961: 337,400 million markkaa (up 7% from 1960); imports, 368,300 million (up 8%). Principal exports (in million markkaa, 1961): paper industry products, 153,900; wood industry products, 84,100; timber, 29,600; metals industry products, 38,600; agricultural products, 15,300. Principal imports: raw materials (46% of total imports); investment goods (28%); consumer goods (17%); and fuels and lubricants (9%). Chief customers (with percentage of total Finnish exports received, 1961): Great Britain (22.2%); West Germany (12.9%); the Soviet Union (12.1%). Principal suppliers (with percentage of total imports provided, 1961): West Germany (21.3%); Great Britain (15.3%); the Soviet Union (13.3%); Sweden (11.5%).

Events, 1962.—The year 1962 was a very good year for the Finnish economy generally. Industrial production increased some 5%, compared with 7% in 1961. Employment remained high, and the number of vacant jobs exceeded the number of unemployed. The cost-of-living index rose 4.3% from October 1961 to June 1962. Despite some decline in foreign demand for wood industry and agricultural products, exports during January–June 1962 ran 12% higher (imports, 11%) than in the same period of 1961. In August 1962, Finland cut duties on European Free Trade Association imports 10%, for a total reduction of 40% since mid-1961. Similar concessions were extended to Soviet imports. Prospects for Finland's association with the European Economic Community remained very doubtful. In August, Finland received a loan of $25 million from the World Bank to finance a 303,000-kw. increase in her thermal generating capacity. On Jan. 1, 1963, a new currency was introduced: a new markka, whose value is 100 times that of the old unit.

Elections and the formation of a new cabinet dominated the domestic political scene in 1962. On February 15, Urho Kekkonen was re-elected president by 199 of the 300 electors chosen in national elections on January 15–16. The candidates of the People's Democrats (Paavo Aitio), the Social Democrats (Rafael Paasio), and the Socialist Opposition (Emil Skog) received 62, 37, and 2 votes, respectively. Center parties made impressive gains in parliamentary elections held February 4–5, in which 2,310,066 voters went to the polls, a record 84.5% turnout. The Agrarians won 23.1% of the popular vote and gained 5 seats; the Liberals increased their representation also by 5, the Conservatives by 3. The Finnish People's Democratic Union (Communist) lost 3 seats and its place as Finland's largest single party (now the Agrarian Union). The badly split Socialists, divided into the Social Democratic Party and the Socialist Opposition, lost a total of 12 seats. The government of Martti Miettunen (formed July 14, 1961) resigned on March 1. Six weeks later, Ahti Karjalainen (Agrarian) succeeded in putting together a non-Socialist government of 5 Agrarians, 3 Conservatives, 2 Liberals, 2 Swedish People's Party, and 3 representatives of the Central Federation of Finnish Trade Unions. The Foreign Minister is Veli K. Merikoski (Finnish People's Party).

Following President Kekkonen's re-election, Finnish-Soviet relations returned to normal. On June 26 the two countries agreed on an exchange of microfilmed historical records. A 50-year treaty re-opening the Saimaa Canal (an important waterway in southeastern Finland lost to the USSR after World War II) under Finnish control was signed in Moscow on September 27. Finland assumed the major cost of rehabilitating the canal (estimated at over 14,000 million markkaa) and is to pay annual rentals ranging from 180,000 to 260,000 rubles. Revenue from tolls was estimated at 230 million markkaa a year.

President Urho Kekkonen of Finland was elected to his second six-year term on Feb. 15, 1962.

PARIS MATCH

The Communist-sponsored 8th Youth and Student Festival was held in Helsinki July 29–August 6. Anti-Communist demonstrations attracted international press comment. (See also COMMUNISM.)

Distinguished foreign visitors to Finland in 1962 included Israel's Premier David Ben-Gurion and UN Acting Secretary-General U Thant, who was reminded by Prime Minister Karjalainen that "Finland was the first country, with Norway, to buy United Nations bonds for an amount twice our assessment" ($1,480,000). President Kekkonen made state visits to France and Sweden and spent a 14-day vacation in October in the Soviet Union.

On June 20 the Supreme Court upheld the lower court conviction for loan irregularities of former Prime Minister Vieno J. Sukselainen and 16 other members of the State Pensions Institution, but, quashed their dismissal as members of the board. Finland's first atomic reactor was dedicated on August 30.

JOHN I. KOLEHMAINEN,
Chairman, Department of Political Science, Heidelberg College, Tiffin, Ohio.

FIRES AND FIRE LOSSES

Fires in the United States in 1962 caused 11,800 deaths and $1.55 billion in losses, a preliminary estimate by the National Fire Protection Association (NFPA) indicated. Final NFPA figures for 1961 show that 2,190,040 fires took 11,700 lives and destroyed $1,526,300,000 worth of property, as compared with 11,350 fatalities and $1,544,200,000 damage in 1960.

Property damage in 1961 reversed a three-year trend of constantly rising losses, but the total still remained above the $1.5 billion mark. Fire damage to all buildings and contents totaled $1,232,400,000 in 1961, $1,139,700,000 in 1960, and $1,083,210,000 in 1959.

The largest fire in the United States in 1961 was the $25 million Los Angeles conflagration which destroyed more than 500 buildings, mostly homes, in November. The largest loss of lives by a single fire occurred the same month near Richmond, Va., when an aircraft burned following a crash, killing 77.

The 383 large-loss fires in the accompanying table comprised less than 0.02% of the total number of 1961 building fires but caused about 18% of the monetary loss.

The NFPA's Fire Record Department reported approximately 857,400 building fires in the United States in 1961. The remaining 1,332,640 fires involved aircraft (140), motor vehicles (264,500), forests (98,500), brush, grass, and rubbish (943,600), and miscellaneous (25,900).

CLASSIFICATION OF LARGE-LOSS FIRES IN THE U.S., 1961
(Individual loss of $250,000 or more)

Classification	Number	Loss
Manufacturing	116	$ 69,195,000
Storage and warehousing	52	25,617,000
Mercantile	49	19,227,500
Aircraft	29	64,299,000
Residential	18	33,088,000
Forest	16	12,365,500
Bowling alleys	16	6,037,000
Schools and colleges	15	7,163,500
Department stores	14	10,304,000
Clubs (night, city, and country)	10	2,922,500
Restaurants	10	3,966,000
Supermarkets	8	3,103,000
Churches	7	3,334,500
Ships and trucks	5	9,476,500
Institutions	4	1,214,500
Office buildings	4	2,870,500
Radio and TV stations	2	1,400,000
Miscellaneous	8	3,242,500
Total	383	$278,826,500

Fires in private dwellings declined about 5% in 1961, to 534,200, but deaths in these fires rose slightly to about 6,100. Property damage to homes totaled $337,400,000. Four or more persons died in each of 109 residential fires. About 3,450 children—the principal victims of fire—were killed in 1961.

FISH. See FISHERIES INDUSTRY; HUNTING AND FISHING; and the Index entry, *Fish.*

FISH AND WILDLIFE SERVICE. See Index entry.

FISHERIES INDUSTRY

The catch of fish and shellfish in the United States in 1961 totaled nearly 5.2 billion pounds, the nation's second largest. The catch was 5% greater than in 1960, due to increased catches of industrial fish, principally menhaden. From 21% of the 1961 catch plus 232 million pounds of imported herring, salmon, and tuna, packers produced 1 billion pounds of canned products, worth $422,836,394. About 47% of the catch, plus processing waste, and about 18.3 million pounds of imported herring yielded industrial products worth $75 million. Of the catch, 30% was used fresh or frozen and 2% was cured. In 1961, the catch used for human food amounted to 2.5 billion pounds; 2.7 billion pounds were used in the manufacture of industrial products and for animal feeding.

The catch in 1962 was again expected to total about 5.2 billion pounds. Production of Maine sea herring, king crabs, shrimp, yellowtail flounders, and bluefish showed substantial increases in 1962. Decreases occurred in landings of tuna, Pacific sardines, and Alaska herring. The U.S. Bureau of Labor Statistics wholesale price index for fish and shellfish in October 1962 was 119.0, 7.8 points higher than a year earlier.

Approximately 128,000 fishermen and transporters operated about 76,000 vessels and boats in 1961, and the fishermen averaged a catch of 40,500 each. Fishermen received $364 million for the 1961 catch, about $10 million more than in 1960. Processing of the catch by about 93,000 shore workers in 4,200 plants and distributing it to the ultimate consumer increased the value to $1.1 billion.

For the 16th consecutive year, the menhaden fishery in 1961 produced the industry's largest landings. The catch, amounting to 1,157,338 tons, was 148,200 tons more than in 1960. The 1962 menhaden catch was about 15% larger than in the previous year, and accounted for 45% of the total United States production of fish and shellfish.

The Pacific sardine catch—which averaged over 500,000 tons from 1934 to 1944—yielded only 21,584 tons in 1961. The canned pack amounted to 419,086 cases. Few sardines appeared off California in 1962, and the catch totaled less than 10,000 tons. The canned Maine sardine pack produced from sea herring amounted to 753,647 cases in 1961, 62% less than the 1960 total. The pack in 1962 exceeded 2 million cases for the first time since 1958. The 1961 salmon pack canned in Alaska, Washington, and Oregon, totaled 3,696,726 cases, 30% more than in 1960. The 1962 Alaska canned salmon pack of 3,420,400 cases furnished the bulk of the year's pack of about 3.7 million cases.

The 1961 canned tuna pack of 15,767,704 cases, including the output in American Samoa and Puerto Rico, was 462,300 cases larger than in 1960 and set a new record. The 1962 pack totaled about 17 million cases.

Menhaden, herring, other industrial fish, and processing waste were utilized in 1961 to produce 311,000 tons of fish meal (valued at $31,940,000), 34,416,000 gallons of oil ($14,373,000), and 112,300 tons of fish solubles ($5,469,000). Manufactured shell products were valued at $9,361,000. Production of other industrial products (such as agar agar, fish feed pellets, kelp products, and pearl essence) was valued at $13,426,000.

Fresh fish landings at Boston, Gloucester, New Bedford, and on Cape Cod, Mass., in 1961 amounted to 431,644,000 pounds, valued at $32.9 million, a decline of 3% in volume but an increase of 3% in value compared with 1960 levels. In 1961, San Pedro, Calif., led all ports with landings of 207,900 tons, principally tuna, Pacific sardines, and mackerel. Pascagoula, Miss., ranked next with landings of 192,200 tons, mainly menhaden and other industrial fish. Lewes, Del., received 140,000 tons, largely menhaden; Cameron, La., 126,100 tons, principally menhaden; Empire, La., 123,600 tons, almost entirely menhaden; Reedville, Va., 108,800 tons, chiefly menhaden; Beaufort–Morehead City, N.C., 90,700 tons, mostly menhaden; Gloucester, Mass., 81,600 tons, largely whiting, ocean perch, and industrial fish; Boston, Mass., 58,500 tons, mostly haddock, pollock, and cod; and New Bedford, Mass., 50,450 tons, chiefly sea scallops and flounders.

Alaska Sealskins.—A total of 53,460 male and 24,455 female skins was taken in 1962 from federally supervised fur seal herds on Alaska's Pribilof Islands in the Bering Sea. Dressed and dyed male skins sold at public auction in St. Louis, Missouri, averaged $107.53 each in the fall of 1962, as compared with $106.42 in the spring. Female skins sold for $48.40 at the fall sale and $44.33 in the spring.

Whales.—In 1961, catcher boats operating from the two whaling stations on San Francisco Bay took 338 whales, and 5 whales were taken at a new station on the Columbia River. The whales were used in the production of whale and sperm oil, meal, and frozen animal food, valued at $847,000.

Frozen Fish.—On Nov. 1, 1962, frozen fish holdings in the United States totaled 218 million pounds, compared with 207 million pounds a year earlier. Shrimp, salmon, mackerel, fish blocks (mainly cod), halibut, whiting, and ocean perch fillets formed the bulk of the holdings.

Foreign Trade.—United States foreign trade in fishery products amounted to $431.8 million in 1961, 7% higher than the 1960 levels. Imported edible products amounted to 1,061,662,000 pounds, valued at $336 million, or 44% of the United States supply. Imported nonedible products were valued at $61.3 million. Edible products exported in 1961 totaled only 40,137,000 pounds, valued at $19.6 million, a decline of 34.7% in volume and 23.5% in value from the previous year. Exported nonedible products were valued at $15.1 million.

World Production.—Information released by the U.N. Food and Agriculture Organization indicated that in 1961 the United States ranked fifth among the nations of the world in the catch of fish, shellfish, and other sea products. Japan ranked first with 14.8 billion pounds, followed by

Peru with 11.5 billion pounds. China ranked third with 11 billion pounds (based on estimates made by FAO), followed by the USSR with 7.1 billion pounds. The United States was next with 6.4 billion pounds. These five nations produced about 56% of the total world catch of 90.8 billion pounds in 1961.

E. A. Power,
Chief, Branch of Statistics, Bureau of Commercial Fisheries, U.S. Fish and Wildlife Service.

FLAGSTAD, Kirsten Malfrid

Norwegian soprano: b. Hamar, Norway, July 12, 1895; d. Oslo, Norway, Dec. 7, 1962.

At the time of her retirement in 1953, at the age of 58, Kirsten Flagstad was regarded as the foremost Wagnerian soprano since Frida Leider,

Kirsten Flagstad (1895–1962)

UPI

and as the possessor of one of the great voices of the century. However, it was not until midway in her 40-year operatic and concert career that she gained international recognition.

Intended for the medical profession by her parents, who were musicians, she began to study music seriously while recovering from an illness. On Dec. 12, 1913, she made her debut at the National Theater, Oslo, singing the small part of Nuri in Eugen D'Albert's *Tiefland*. At that time she had a small voice, but she developed it through further study and a long series of appearances in musical comedy, operetta, and opera in Oslo and Göteborg (Sweden). After a brief retirement in 1930 following her marriage to Henry Johansen, a lumber merchant, she sang at Bayreuth (1933–34). The New York Metropolitan Opera engaged her for its 1934–35 season only as a temporary replacement for Frida Leider, but after Flagstad's sensational debut there on Feb. 2, 1935, as Sieglinde in Wagner's *Die Walküre*, she remained until 1941, appearing in London, Vienna, and elsewhere between New York engagements. During the late 1930's, she and Lauritz Melchior made the Wagnerian repertory the Metropolitan's leading asset.

Returning to German-occupied Norway in 1941, Flagstad sang only in Sweden and Switzerland until after the death of her husband in 1946 as he awaited trial for collaboration with the Nazis. The next year she resumed her career in the face of considerable protest over her conduct, which she defended, stating: "My life has been music; I know nothing of politics." In her European and American concerts she sang with undiminished vocal splendor, and in 1950 she returned triumphantly to the Metropolitan. She made her final appearance there on April 1, 1952, in the title role of Gluck's *Alceste* (in English).

Even in her 60's, after her retirement from the stage, she continued to make brilliant recordings, including a complete *Götterdammerung*. In 1958 she was named director of the Norwegian Opera, in Oslo. *The Flagstad Manuscript*, her autobiography as related to Louis Biancolli, was published in 1952.

FLEMING, Donald Methuen

Canadian minister of justice and national revenue: b. Exeter, Ontario, May 23, 1905.

Donald M. Fleming was educated at the Collegiate Institute in Galt, Ontario, and at the University of Toronto, where he received his B.A. degree in 1925. He then studied law in Toronto, at the Osgoode Hall Law School and the university (L.L.B., 1930). Admitted to the Ontario bar in 1928, he was a partner in the Toronto law firm of Kingsmill, Mills, Price & Fleming from 1929. He became a king's counsel in 1944.

A Conservative, Fleming was a member of the Toronto City Council from 1939 to 1944, and served on the City Planning Board from 1942 to 1944. In 1945 he was elected to the House of Commons for Eglinton (Toronto), and was re-elected in 1949, 1953, 1957, and 1958. Following the Conservative victory in the elections of June 10, 1957, he was named minister of finance and receiver general by Prime Minister John Diefenbaker. During 1961, Fleming engaged in a prolonged controversy with James E. Coyne, governor of the Bank of Canada, over the fiscal policies of Coyne, who finally resigned after the dispute had been carried into Parliament. On Sept. 30, 1961, Fleming was elected the first chairman of the Organization for Economic Cooperation and Development (OECD).

In his budget message to Parliament on April 10, 1962, Finance Minister Fleming announced a budget tailored to general business improvement and economic growth, but with an anticipated deficit of $745 million for fiscal 1963. On May 2, after Canada's exchange reserves had fallen markedly, Fleming announced the stabilization of the Canadian dollar at U.S.$0.925, reversing the 12-year-old Canadian policy of keeping the Canadian dollar on a fluctuating exchange rate system.

In the general elections of June 18, 1962, Fleming retained his seat in the House of Commons by the narrow margin of only 762 votes. On June 24, Prime Minister Diefenbaker announced an austerity program involving several emergency economic measures to defend the stability of the Canadian dollar. On August 9 he carried out a general reorganization of his cabinet, in which Fleming became minister of justice and national revenue. (See also Canada.)

FLIGHT RECORDS

New records were set in 1962 in the categories of manned space flight and of rocket-powered and jet aircraft, helicopter, and women's aviation. Some of the more outstanding records are discussed below. They are unofficial unless otherwise noted.

Space Flight.—Five manned orbital flights, three by the United States and two by the Soviet Union, took place in 1962. The United States flights were manned by Lt. Col. John H. Glenn, Jr., February 20; Lt. Comdr. M. Scott Carpenter, May 24; and Comdr. Walter M. Schirra, October 3. Soviet Maj. Andrian G. Nikolayev began an orbital flight on August 11, followed the next day by Lt. Col. Pavel R. Popovich. Nikolayev's flight set the only new records established for distance and time: 64 orbits and 94 hours in flight. (See Space Flight.)

Rocket-Powered Flight.—Records were again set by the National Aeronautics and Space Administration's experimental X-15 aircraft. A world speed record for manned winged aircraft of 4,105 mph. was made on June 27 by Dr. Joseph A. Walker.

In a flight on July 17, Maj. Robert M. White piloted an X-15 to a record height of 314,750 feet

(slightly more than 59.6 miles), officially recognized by the Fédération Aeronautique Internationale (FAI). The flight marked the first time a winged vehicle had gone over 50 miles above the earth and thereby had achieved space flight. As a result of the flight, White became the first X-15 pilot to qualify as an astronaut.

Jet-Powered Aircraft.—Records in speed, speed of climb, and distance were set in 1962. An Air Force B-58 jet bomber set three transcontinental speed records recognized by the FAI (round trip —4 hours 41 minutes 14.98 seconds; West-East—2 hours 58.71 seconds; East-West—2 hours 15 minutes 50.08 seconds) in a 4,900-mile nonstop Los Angeles–New York round-trip flight on March 5. Piloted by Capt. Robert Sowers, the plane averaged 1,044.96 mph. (well above the speed of sound).

A Soviet E-166 set a world jet speed record of 1,652 mph. near Moscow on July 7.

A world time-to-climb record was set March 6 by an F-4H Navy jet fighter which climbed 7½ miles in 1 minute 17 seconds. On April 13, Lt. Comdr. Del W. Nordberg piloted a Navy McDonnell F4H1 Phantom II jet to a speed-climb record of 98,425.2 feet (19 miles) in 371.43 seconds.

Maj. Clyde T. Evely piloted an Air Force B-52H superbomber to a world distance record for nonstop flight without refueling in a flight from Okinawa to Madrid (12,532 miles) on January 11. The FAI recognized the record, as well as seven speed and course records on legs of the trip.

A Douglas DC-8 jet airliner set a nonstop distance record for commercial aircraft in a February 23 flight of 8,705 miles from Tokyo to Miami.

Capt. William F. Stevenson, in an Air Force B-52H superbomber on June 6–7 set a world distance record (11,337 miles) for a closed course without refueling; this record was recognized by the FAI.

Women's Flight Records.—Jacqueline Cochran on April 22 set a world record for jet plane distance in a straight line (2,279 miles between New Orleans and Gander, Newfoundland) in a four-engine Lockheed Jetstar Executive. This record was acknowledged by the FAI, together with 22 others (three of them being records for women) involving combinations of record times between various cities on the entire trip, which ended at Hanover, West Germany.

French aviatrix Jacqueline Auriol flew a Mirage III jet to a women's 100-km. (62.1-mile) world speed record of 1,149.23 mph. over the Istres, French military airbase, on June 22.

Helicopters.—In a flight on February 5 from Milford to New Haven, Conn., a Navy antisubmarine Sikorsky HSS2 set a world rotary-winged aircraft speed record of 210.6 mph. for 19 km. (11.81 miles) over a straight-line course. This was the first helicopter to exceed 200 mph.

An Air France H-43B helicopter piloted by U.S. Capt. Richard H. Coan set an FAI-recognized world distance helicopter flight record of 655.5 miles in a 25-mile closed course on June 13.

Capt. Chester R. Ratcliffe, Jr., set a world distance record of 888.4 miles (acknowledged by the FAI) on July 5 in a flight from Hill Air Force Base near Salt Lake City, Utah, to Springfield, Minn.

FLOODS AND FLOOD CONTROL. See Index entries.

FLORIDA

A South Atlantic state of the United States, Florida ranks 22d among the states in area (land, 54,252 square miles; inland water, 4,308) and 9th in population (5,459,000 on July 1, 1962, a 10.3% increase from the 1960 census figure of 4,951,560). Urban places with populations above 15,000 in 1960:

Bradenton	19,380	Daytona Beach	37,395
Brownsville[1]	38,417	Fort Lauderdale	83,648
Carol City[1]	21,749	Fort Myers	22,523
Clearwater	34,653	Fort Pierce	25,256
Coral Gables	34,793	Gainesville	29,701
Hialeah	66,972	Plant City	15,711
Hollywood	35,237	Pompano Beach	15,992
Jacksonville	201,030	St. Petersburg	181,298
Key West	33,956	Sanford	19,175
Lake Worth	20,758	Sarasota	34,083
Lakeland	41,350	Tallahassee (*capital*)	48,174
Miami	291,688	Tampa	274,970
Miami Beach	63,145	Warrington[1]	16,752
North Miami	28,708	West Palm Beach	56,208
North Miami Beach	21,405	Westwood Lakes[1]	22,517
Orlando	88,135	Winter Haven	16,277
Panama City	33,275	Winter Park	17,162
Pensacola	56,752		

[1] Unincorporated place.

Government.—Chief executive and judicial officers in 1962 included Farris Bryant (Democrat), governor, serving a four-year term; Tom Adams, secretary of state; J. Edwin Larson, treasurer; Bryan Willis, auditor; Richard W. Ervin, attorney general; Thomas D. Bailey, superintendent of public instruction; and B. K. Roberts, chief justice of the 7-member Supreme Court.

The Florida Legislature, which convenes in odd-numbered years, comprised 37 Democrats and 1 Republican in the Senate in 1962 and 88 Democrats and 7 Republicans in the House of Representatives.

Legislation, 1962.—See below, *Events, 1962.*

Finance.—In the 1962 fiscal year, revenue of $1,284,598,054 included $636,828,386 from state taxes and $155,991,486 in federal funds. Chief tax yields were the 3% general sales tax ($181,700,882), motor fuel taxes ($127,914,906), and licensing ($66,491,501). Spending of $1,286,034,899 included $274,091,464 for education, $207,999,115 for health, welfare, and safety, and $157,580,818 for highways.

Education.—In the 1960–61 school year, public elementary schools staffed by 20,538 teachers enrolled 635,375 pupils; 270,960 junior high school students and 169,407 senior high school students were taught by 16,793 teachers; and parochial schools with 1,731 teachers enrolled 57,590. Enrollment in colleges and universities (fall 1961) totaled 79,660 students.

Estimated public school spending in the 1961–62 school year totaled $442,093,000, including current expenditures of $337,882,000 ($341 per pupil) and capital outlays of $83,841,000. Revenue of $407,689,000 was drawn chiefly from state funds ($208,812,000) and local districts ($170,083,000). Teachers' salaries averaged $5,303 (high school, $5,375; elementary, $5,250). Actual spending for higher education (1961 fiscal year) totaled $63,821,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 108,667 persons totaled $79,941,361. This amount included $50,239,085 for the aged and $18,661,670 for dependent children.

Transportation and Communications.—A total of 662 miles of highway construction and reconstruction were completed in the fiscal year 1961; *highways and roads* on Jan. 1, 1961, totaled 69,216 miles (44,439 surfaced). These served 2,814,426 *motor vehicles* (as registered on Jan. 1, 1962), including 2,121,078 automobiles. Operating in the state were (1960) 13 *railroads* (using 4,560 line miles of track) and (1962) 33 regularly scheduled *airlines.* There were (1962) 53 commercial and municipal *airports* and 8 seaplane bases.

Communications media included (1961) 163 AM and 26 FM *radio stations;* 1 UHF and 16 VHF *television stations;* 45 daily *newspapers* (circulation, 1,715,000) and 129 other newspapers (321,491); and (Jan. 1, 1962) 698,300 business and 1,446,800 residential *telephones.*

Labor Force.—The state's labor force in July 1962 included 96,800 agricultural workers. Nonagricultural employment totaled 1,731,500, compared with 1,675,300 a year earlier and an average of 1,763,600 for the 12 intervening months. Of nonfarm employees, 27.5% were in trade, 16.7% in service industries, and 16.6% in government services. Unemployment in July 1962 had dropped to 111,500 from the 143,900 of a year earlier.

LEADING FLORIDA MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(thousands of dollars)	
Food and kindred products	38,016	$142,872	$396,274
Chemicals and allied products	17,475	90,267	290,768
Paper and allied products	13,577	70,512	211,116
Fabricated metals	15,174	65,965	124,196
Stone, clay, glass products	14,034	54,878	119,875
Printing and publishing	13,521	64,660	114,602
Lumber and wood products	11,413	32,189	56,942
Furniture and fixtures	8,122	26,704	43,830
Tobacco products	7,105	20,641	40,391

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Manufacturing.—Manufacturing engaged 192,950 workers in 1960, including 135,488 in production, and provided a payroll of $848,191,000. Adjusted value added by manufacture totaled $1,804,385,000.

Mining.—Florida ranked 23d among the states in mineral output in 1961, with 1.05% of the national total. The 1961 value was an all-time high, topping the 1960 record by 8%. The state was first in output of phosphate rock, and the sole producer of staurolite and zirconium; second in rare earth metals and titanium; and third in magnesium compounds.

FLORIDA MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Clays	513,000	$ 7,202,000
Lime	213,000	3,555,000
Peat	24,573	149,000
Phosphate rock (long tons)	13,789,000	95,590,000
Sand and gravel	6,530,000	5,577,000
Stone[1]	28,855,000	36,305,000
Other minerals	...	44,802,000
Total	...	$190,933,000[2]

[1] Excludes certain stone; value included in "Other minerals." [2] Total adjusted to eliminate duplications in value of clays and stone. (Source: U.S. Bureau of Mines.)

Fisheries.—The commercial fish and shellfish catch in 1961 totaled 190,167,846 pounds valued at $25,727,578. The principal catch was shrimp (42,127,663 pounds valued at $13,546,633).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $682,418,000, compared with $682,272,000 for the corresponding period of 1961. For the full year 1961, income comprised $207,709,000 from livestock, $649,933,000 from crops, and $9,039,000 in government payments. Principal income sources in 1961 were oranges, $297,715,000; wholesale milk, $80,482,000; cattle, $63,543,000; and tomatoes, $50,128,000.

The state's 45,000 farms in 1959 had an acreage of 15,237,000 (1,882,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,596,000 cattle, 377,000 hogs, 7,078,000 chickens, and (1961) 39,110,000 commercial broilers.

FLORIDA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Avocados (tons)	9,140	6,100	9,400
Beans, snap (1,000 cwt.)	1,707	1,646	1,592
Corn for grain (1,000 bu.)	7,058	9,636	9,042
Grapefruit (1,000 boxes)	34,940	35,000	38,000
Limes (1,000 boxes)	331	340	400
Oranges (1,000 boxes)	86,120	113,400	120,500
Pecans (1,000 lb.)	4,544	4,800	2,500
Strawberries (1,000 lb.)	8,962	9,524	13,529
Sugarcane for sugar and seed (1,000 tons)	1,417	2,308	5,244
Tangelos (1,000 boxes)	353[1]	1,000	800
Tangerines (1,000 boxes)	4,330	4,000	4,300
Tobacco (1,000 lb.)	28,160	32,830	34,648
Tomatoes (1,000 cwt.)	993	1,230	972

[1] Short-time average. (Source: U.S. Department of Agriculture.)

Tourism.—During the winter season of December 1961—March 1962 a record 3,413,678 persons visited Florida, according to the State Development Commission, bettering the record high of 1957–58 and foreshadowing a banner year for the state's top industry. New attractions for the tourist included the new Falling Waters State Park, between Tallahassee and Pensacola, and the Pinellas County Bayway, a 15.2-mile network of roads and bridges leading to one of the most extensive public recreation areas ever developed in Florida.

Events, 1962.—George A. Smathers of Miami, advocate of an aggressive policy toward Communist Cuba, won election on November 6 to a third term in the U.S. Senate over his Republican opponent, Emerson Rupert, by a 3–1 margin. Also reelected by a large majority for his fifth term in the U.S. House of Representatives was William C. Cramer, Republican of St. Petersburg.

A Republican foothold in central Florida was secured as Edward J. Gurney, former mayor of Winter Park, was elected representative to the Congress from one of four newly created congressional districts. The other three new seats were won by Democrats, including former U.S. Sen. Claude Pepper. Democrats also won reelection to the remaining seven districts in Congress.

Mrs. Beth Johnson of Orange County became the first woman ever to sit in the Florida State Senate. She had served in the House.

In July 1962, a three-judge federal court ruled that the existing legislative make-up was "invidiously discriminatory" against populous sections of the state, and, being in violation of the 14th Amendment, was "null, void and inoperative." On August 1, Gov. Farris Bryant convened the Legislature in special session to consider reapportionment. Before adjourning on August 11, the Legislature adopted a constitutional amendment providing for 46 senators and 135 House members (compared with the existing Senate of 38 members and the House of 95). On September 5 the three-judge federal court declared this amendment sufficiently satisfactory to be submitted to the people, but at the general election on November 6, it was defeated by approximately 67,000 votes. Opponents argued that it enabled 13.4% of Florida's population to elect a majority of the Senate and 27% to elect a majority of the House.

In an effort to reach a solution to the seven-year-old reapportionment problem, the governor called the newly elected Legislature into a second special session on November 9. After 20 days of debate, however, the lawmakers failed to arrive at a formula which would satisfy both the rural and urban interests, and the job of reapportionment was turned over to the federal court.

In August, Escambia became the sixth Florida county to begin desegregating its schools; lunch counters in variety and department stores and drugstores had been desegregated without incident in Pensacola, seat of Escambia County, in February. In September, Negroes entered the undergraduate division of the University of Florida, at Gainesville, for the first time, and three Negroes became the first to enter as regular students at Florida State University, Tallahassee.

Southern Florida was the scene of a major military buildup in October. Even before the Cuban quarantine was proclaimed, Key West was reinforced with several thousand combat-ready

Icicles hang from citrus trees in Palm Harbor, Fla., in the cold wave that damaged the state's fruit crop in December.

UPI

Marines and an additional squadron of Navy jets, and MacDill Air Force Base, at Tampa, was placed on an alert basis. On October 24, the first day of the quarantine, the Federal Aviation Agency directed civilian aircraft away from the southern part of the state. The Army assumed command of the international airport and leased other facilities at Key West, and antiaircraft positions were installed throughout the Florida Keys. Cuban refugees in the Miami area continued to present major local problems, but progress was being made in their resettlement (see REFUGEES AND DISPLACED PERSONS).

St. Petersburg's third epidemic of encephalitis ("sleeping sickness") in four years hit the city in midsummer, and by early September, 177 cases and 16 deaths had been reported. Tourism, the city's chief industry, suffered a severe decline.

Industrial growth continued in the state during 1962, maintaining an estimated rate of 50 new plants per month, besides an expansion of existing facilities. An important agricultural development arising from the elimination of the Cuban sugar quota has been the erection of six new mills to harvest the expected production for the year of 900,000 tons of sugar.

The most severe cold wave in many years struck the state in December, causing heavy damage to the citrus and vegetable crops. Subfreezing temperatures were recorded in many cities, including a record 18.5° in Tampa.

FOOD AND DRUG ADMINISTRATION

An agency of the U.S. Department of Health, Education, and Welfare, the Food and Drug Administration (FDA) enforces the Food, Drug, and Cosmetic Act and five other consumer protection laws. Enforcement activities in 18 districts are coordinated in Washington, D.C.

Foods.—Over 45,000 chemical formulations are available to the operators of 3.8 million farms for more effective production of crops. FDA establishes and enforces tolerances to prevent the shipment of crops containing unsafe levels of agricultural poisons. In the fiscal year 1962, seizures were made of 1,903 tons of grains, beans, alfalfa meal, and leafy vegetables containing residues of pesticides that were not permitted or that were in excess of the tolerances.

Approximately 2,200 chemicals are used in food processing and packing by 73,000 firms. FDA gives attention during food establishment inspections to whether additives being used are permissible and are being used at safe levels. A total of 226 tons of food containing unpermitted additives or harmful contaminants were seized in the 1962 fiscal year.

During the same period, seizures were made of 7,545 tons of filthy or decomposed food; 85 seizures involved labeling violations, in which the information required by law to appear on the label was hard to find, hard to read, or missing.

Drugs.—The Food, Drug, and Cosmetic Act of 1938 requires that new drugs be cleared for safety on the basis of evidence provided by the manufacturer. This provision prevented the drug thalidomide from reaching the United States market and causing tragic deformities in babies such as occurred in Europe. Under an exemption in the law for investigational drugs, however, more than 1,200 United States doctors were furnished 2.5 million tablets of the drug. When this was learned, FDA proposed new regulations to tighten controls over the distribution of investigational drugs. Amendments were enacted in October 1962 to assure a greater degree of safety, effectiveness, and reliability of drugs, requiring manufacturers, among other things, to prove effectiveness for labeled use as well as safety before drugs are marketed. (See also PEDIATRICS.)

About 40 seizures of drugs valued at more than $1 million were made during the year in a program to curb dangerous abuses in the collecting and selling of discarded physicians' samples.

FDA cleared 273 new drugs for marketing in 1962. Products tested and certified in FDA laboratories comprised 5,798 batches of colors, 354 of insulin, and 15,356 of antibiotic drugs.

Household Protection.—The Federal Hazardous Substances Labeling Act, which requires consumer protection information on the labels of hazardous household products, went into effect on Feb. 1, 1962. Included in the early seizures were soldering salts, carbon tetrachloride, and turpentine—all without the required warning.

FOOD RESEARCH

Of the many areas of food investigated during 1962, three especially important ones will be reviewed in this article: (1) the quality of meat; (2) formula development; and (3) texture improvement in dehydrated vegetables.

Meat Quality.—Two factors influencing the eating quality of meat considered in 1962 were the amount and distribution of fat in pork and the antemortem injection of proteolytic enzyme.

Increased demand for lean pork of good eating quality sparked investigations of the traditional, but largely unsupported, view that intramuscular fat and marbling in the carcass are of primary importance in determining the tenderness and juiciness of cooked pork. Results of these investigations, while variable, seem to indicate that loins with low levels of intramuscular fat and marbling tend to be tougher and less juicy when cooked than those with higher levels. The relationships are not sufficiently close to be used for predictive purposes, however. Muscles in other parts of the carcass have received little attention in this respect, but in one rather extensive study only a few of them showed close association between intramuscular fat content or marbling and tenderness or juiciness.

Work with proteolytic enzymes has proved that a tenderizing effect accompanies direct contact between the enzyme and meat tissue. Only in 1962, however, have data been published which indicate a similar effect with injection of enzyme into the bloodstream of an animal shortly before slaughter. The evidence offered is of three types: the relative tenderness of paired cuts, one treated and the other untreated; the effect of different levels of enzyme treatment; and consumer reaction to treated and untreated cuts.

The paired cuts were obtained by introducing the enzyme (papain) into the jugular veins of a number of ewes after surgically blocking blood cir-

culation to the right legs. Subsequent judging of the roasted pairs of legs showed that the left was markedly more tender than the right.

The enzyme level was tested on Commercial and Good grade beef steaks and roasts from animals which had received different amounts of enzyme by antemortem injection. Tenderness of the cooked meat increased appreciably and consistently as the quantity of enzyme injected increased.

Consumer reaction was obtained from 50 families who rated not only the relative tenderness but also the flavor and juiciness of beef chuck roasts from enzyme-treated animals and beef rib roasts from nontreated ones. All of the meat was cooked with dry heat, a method normally reserved for naturally tender cuts, such as beef rib (but not chuck) roasts. All of the quality characteristics were rated slightly (but probably not significantly) higher in the chuck than in the rib roasts.

The tenderizing effect was shown to take place at temperatures reached only during cooking. Evidence with regard to the effective temperature range came from both chemical and organoleptic experiments. In the former, little tyrosine was formed during several hours' incubation of papain and ground beef at 50°C. or below, but steeply increasing amounts were formed as the incubation temperature increased to the maximum tested (90°C.).

In the organoleptic tests, mutton chops from enzyme-treated sheep were judged as showing no tenderizing effect from the enzyme when cooked to interior temperatures of 55°C. or below, but as showing slight, fair, and good effects, respectively, when cooked to 60, 65, and 82°C.

Formula Development.—Adjusting the formula of a food product to the point at which it yields maximum quality has always been difficult because of inadequate methodology. Procedures available have indicated the effects of variations in a single ingredient at a time; but an adequate procedure must show the effects of variations in several ingredients simultaneously.

A statistical design developed from surface-response methodology has given promise of providing a procedure which, if not completely adequate, is at least worthy of further study. This design was used in 1962 to determine the optimum levels of salt and sugar in cured hams and to investigate the effects of different proportions of five basic ingredients on the volume and contour of lean-formula cakes. The former study indicated that maximum palatability occurred in hams which contained 2.60% salt and 1.14% sucrose. The latter study brought out numerous response-ingredient relationships. Volume and contour, for example, were particularly sensitive to variations in the baking powder ratio (percentage of baking powder to percentage of other ingredients) and the sugar-to-water ratio. The degree of change with variation in either ratio depended, however, on the exact level of the other.

Texture Improvement in Dehydrated Vegetables.—Pioneer work on a method of imparting a porous structure to dehydrated vegetable pieces was reported, enabling rapid dehydration and subsequent rehydration. For example, ⅜-inch potato and carrot cubes having this structure absorbed a greater amount of water and became more tender during 5 to 6 minutes in boiling water than did conventionally dehydrated cubes in 20 to 25 minutes. The process consists of heating partially dehydrated vegetable pieces in a closed vessel until the water in the pieces is above its atmospheric boiling point, then discharging them instantly. The flashing of water vapor from within each piece creates the porous structure. The puffed pieces are then dried conventionally to the predetermined final moisture content.

University of Minnesota.

FOOD SUPPLY

As the world's population continued its rapid expansion, the question of food and its relation to people came into increasingly sharp focus in 1962. Demographers, with their attention focused on population, tended to view the future with alarm. Agriculturists, mindful of the progress and potential of agriculture, saw the basic problem as one of applying to natural resources knowledge already at hand.

U.S. Secretary of Agriculture Orville L. Freeman, addressing a conference on Food and People in Washington, D.C., remarked: "The productivity of American agriculture . . . has given us the power to free mankind from the specter of hunger and famine." Food, he said, can be "the greatest instrument for peace and freedom which we have yet developed."

The acting secretary general of the United Nations, U Thant, in July 1962 told the 34th session of the UN Economic and Social Council in Geneva: "Endowed as our planet is, and able to take advantage of its riches as we have become, it is no longer resources that limit decisions. It is decisions that make resources. . . ."

The task of translating these sentiments into actuality, however, is a monumental one. In a detailed survey of world food conditions, *The World Food Budget 1962 and 1966,* published in April 1962, the U.S. Department of Agriculture concluded that diets are now nutritionally adequate in the 30 industrialized nations of the temperate northern area of the earth. These nations, accounting for about one third of the world's population, comprise the United States, Canada, western and eastern Europe (including the Soviet Union), Japan, Australia, and New Zealand. Their production of food, and of goods and services they can trade for food, assures their food supply for the foreseeable future, except in the event of nuclear war or other grave cataclysms.

In contrast, the people of most of the 70 less-developed countries in the semitropical and tropical southern area of the earth have diets which are nutritionally inadequate, with shortages of protein, fat, and calories. In these countries, which have a population of over 1.9 billion persons, population is expanding rapidly and malnutrition is widespread and persistent. The areas of want are, in general, Latin America, Africa, Asia, and the Far East. Within them, however, are numerous exceptions—Japan and Taiwan in the Far East; Turkey, Lebanon, and Israel in Asia; the Republic of South Africa and the Federation of Rhodesia and Nyasaland in Africa; and Argentina, Uruguay, Chile, Brazil, Costa Rica, Cuba, and Mexico in Latin America. On a national average basis, diets in these countries meet nutritional standards. Nevertheless, large elements of the population in some of them (in northeastern Brazil, for example), are believed to have substandard diets.

World food shortages in 1962 were expressed by the Department of Agriculture in terms of the following: animal protein, equivalent to 1.5 million metric tons of nonfat dry milk; pulse protein, equivalent to 150,000 tons of dry beans and peas; fats, equivalent to 3 million tons of vegetable oil;

UNICEF PHOTO BY JACK LING

Schoolchildren in Orissa State, India, eat lunches consisting partly of fruits and vegetables they have grown. United Nations provides tools and other assistance for the program.

and other protein and calories, equivalent to 29 million tons of wheat. Compared with total world food production, these deficiencies are not large, but the problem is greatly aggravated by the fact that food resources and supplies are extremely uneven in the various parts of the world.

As the *World Food Budget* points out, the problem centers primarily in the Far East and Communist Asia, where a dense and growing population makes increasing demands on the food supply. The Far East, excluding Communist China, has two thirds of the wheat shortage and almost half of the animal and pulse protein shortage. Diets in Communist China lack about half of the required animal protein and fat. The country also has a shortage of about 3 million tons of wheat. About 85% of the world nutritional gap is concentrated in Communist China and other countries of the Far East.

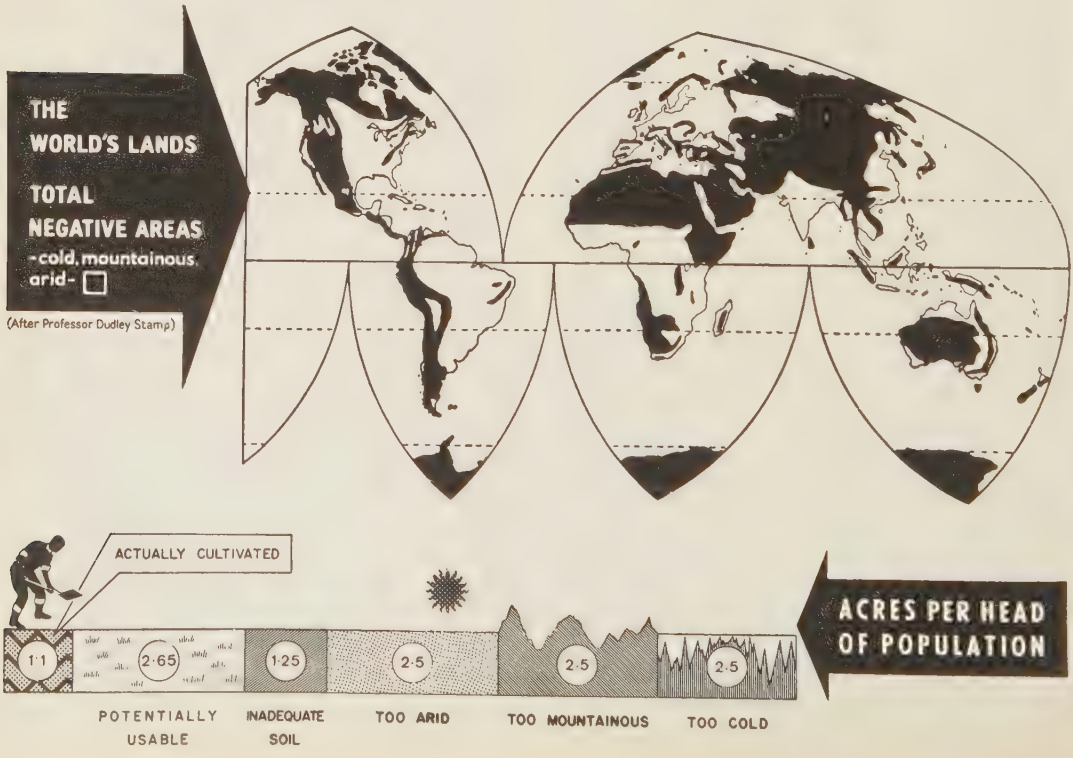
During the 1950's and early 1960's, food production and supplies increased more rapidly than population, so that per-capita food supplies in 1962 were about 13% larger than in the years just before World War II.

Food Production in 1962.—World food output in 1962, as in most of the preceding 15 years, slightly exceeded the 2% annual increase in population. World food supplies for the 1962–63 season were therefore expected to be larger than they were a year earlier.

Production of the principal food grains was relatively large. Record wheat crops in western Europe, India, and Turkey, and good wheat crops in Japan, Pakistan, Turkey, North Africa, Canada, and the United States more than offset disappointing production in eastern Europe and the Soviet Union.

The world rice crop was also better than in 1961; India had a record harvest, Japan's production was near record levels, and Communist China had a better crop than in the three previous seasons. A generally good livestock feed situation, outside of eastern Europe and the Soviet Union, supported larger output of livestock and livestock products. Hog slaughter in 1962 was expected to be about 4% larger than in 1961, with production of beef and other meats also higher. Output of milk was only about 1% larger than in 1961, partly because of difficulties in marketing butter, which tended to discourage milk production. World oilseed production reached a new high, and record output of peanuts and cottonseed and an above-average flaxseed crop more than offset a slight decrease in soybeans.

In western Europe, production of food and feed grains, potatoes, sugar beets, deciduous fruit, and livestock exceeded that of 1961. In eastern Europe, however, the food shortages caused by the below-average 1961 output, especially of meat and milk, continued in 1962. Yields and production of most major crops were below average, and the livestock industry suffered from short feed supplies for the third consecutive year.



REPRODUCED FROM "THE UNESCO COURIER"

Reports from Communist China indicated that grain output was 7% to 12% above the poor 1961 crop, but large grain imports were still needed to relieve an extremely short food supply. India's third successive record harvest and Japan's bumper rice crop contributed to a small overall increase in food production in the Far East. A 10% increase in cereals raised food production in western Asia slightly above the previous year's better-than-average output.

In Latin America total output rose slightly but was less than the population growth. Canadian wheat production was estimated at over 550 million bushels, more than double the poor 1961 crop. The grain crops in Australia and New Zealand were expected to be good. Australia expected large meat production, but New Zealand anticipated slightly smaller output of cheese and meat.

Despite recent gains in food production, studies by the UN Food and Agriculture Organization (FAO) indicate that surpluses and shortages may continue side by side far into the future. Thus, by 1970, people in Far Eastern countries (excluding Japan and mainland China) may have only 10 grams or less of animal protein in their daily diets, compared with 65 grams per person in North America. In the meantime, surpluses of wheat, feed grains, butter, and coffee in the developed countries may increase, and surpluses of cocoa and sugar may appear. These basic problems are being addressed by nations jointly through the FAO and individually through such efforts as the U.S. Food for Peace Program.

Freedom from Hunger.—The FAO is vigorously pressing its five-year Freedom from Hunger campaign, scheduled to end in 1965. The basis of the campaign is self-help. Its aim is to aid the less-developed nations to make better use of their own material and human resources. The campaign works on three fronts: Informational and educational programs to provide information on what must and can be done to combat hunger and malnutrition; research to solve the economic, social, and technical problems of agricultural development; and national action programs to demonstrate how selected food supply problems can be solved.

Action undertaken includes wider use of high-quality seed, emphasis on poultry production to provide more protein foods in tropical and subtropical climates, reorganization of farming in countries where agriculture is unbalanced, and information on techniques which yield more food per acre and per animal, as well as more effective use of food supplies.

In addition, FAO has undertaken a World Food Program. Over a three-year period approximately $100 million in food, services, and cash will be used to promote economic growth in newly developing countries, supplement inadequate diets, and meet emergency food needs.

A World Food Congress, scheduled for June 1963 in Washington, D.C., will focus world attention on the Freedom from Hunger campaign.

Food for Peace.—Through the Food for Peace Program, the United States, by itself or in cooperation with other countries, endeavors to lift world nutritional standards. The program's most spectacular achievement thus far is the four-year wheat-rice transaction negotiated with India in May 1960, under which a daily shipload of wheat or rice, for four years, is being sent to India. During the year ended June 30, 1962, about $1.6 billion in food was provided by the United States to other countries through donation, barter, long-term credit, or sale for foreign currencies. By mid-1962, 14 countries had begun programs of using United States food grants for economic and social development projects. More than 1,000 United States agricultural technicians are working in underdeveloped areas to bring the farmers of those countries improved techniques of working their land.

The United Nations has designated the 1960's as the "Development Decade." It is now generally agreed that successful economic development requires a breakthrough in agriculture.

FOREIGN AID PROGRAMS, U.S.

From the end of World War II through June 30, 1962, the United States expended a net total of $89.9 billion for all types of foreign grants and credits. Three fourths of this sum, or $68.2 billion, was in the form of grants, but there were also $13.5 billion in net credits, $5.1 billion in investments in international financial institutions, and $3.1 billion in miscellaneous expenditures. The chief purpose of foreign aid until 1948 was emergency relief; from then until 1952 it helped fi-

Table 1—NET FOREIGN GRANTS, CREDITS, AND OTHER ASSISTANCE (THROUGH NET ACCUMULATION OF FOREIGN CURRENCY CLAIMS) BY PROGRAM AND BY AREA: FISCAL YEARS 1961 AND 1962

(Source: U.S. Department of Commerce, Bureau of Foreign Commerce.)

nance western European reconstruction under the Marshall Plan. Aside from the small technical assistance program (Point Four) begun in 1950, the 1950's were devoted largely to the Mutual Security Program, which centered on building military power, political stability, and closely related economic strength, with increasing attention being paid to non-European areas. The Foreign Assistance Act of 1961, enacted under the Kennedy administration, indicated that the program would shift its emphasis to financing long-term economic and social development, but without neglecting military assistance where it was needed.

Foreign Aid Operations in the Fiscal Year 1962.—Net assistance by program and by area for the fiscal years 1961 and 1962 is shown in Table 1. In the fiscal year 1962 the net total of expenditures reached $5.1 billion, rising by $1.3 billion, or 32%, over the level of the fiscal year 1961. The emphasis in nonmilitary aid shifted from grants to loans; new credits exceeded gross grants by $128 million, while in the previous fiscal year gross grants were $609 million higher than new credits. Latin America received the largest increase in nonmilitary aid and moved into second place among the regions in this category of assistance. The general trend toward nonmilitary assistance continued, its share of net total aid rising to 67%, as compared with 57% in the fiscal year 1961.

The increase in net total aid in the fiscal year 1962 resulted primarily from the combination of a $777 million rise in new credits and a $607 million drop in repayments of principal from past loans. Net grants rose by $52 million, and the net total of other aid, consisting mainly of undisbursed foreign money derived from Food for Peace operations, declined by $227 million. The net total of nonmilitary grants exceeded the net total of credits only because repayment of principal from past loans reduced net expenditures for credits by $681 million; a comparison of nonmilitary gross grants ($1.9 billion) and new credit expenditures ($2.0 billion) shows that, in terms of new business, expenditures for loans actually exceeded those for grants for the first time in recent years, by $128 million. The expansion in the value of loan expenditures reflected the recent trend toward financing economic development by means of loans instead of grants and toward directing this aid to countries with the best prospects for development.

The leading recipients of net nonmilitary aid in the fiscal year 1962 were India ($336 million), Brazil ($305 million), Pakistan ($260 million), Turkey ($205 million), Yugoslavia ($198 million), (South) Korea ($188 million), the United Arab Republic ($187 million), (South) Vietnam ($153 million), Chile ($126 million), and (Nationalist) China ($101 million). As in the previous fiscal year, India received the largest net aid, but its total declined by $139 million. The major net increases over the fiscal year 1961 were in aid to Brazil ($79 million in 1961), Chile ($48 million), Turkey ($109 million), and Yugoslavia ($76 million). Among the leading recipients only two obtained aid almost entirely in the form of grants: (South) Korea ($184 million in grants) and (South) Vietnam ($145 million in grants). This was primarily a reflection of the heavy military burden on the economies of these two underdeveloped countries.

Within the framework of the Alliance for Progress, net nonmilitary aid to Latin America rose sharply, from $267 million in the fiscal year 1961 to $880 million in the fiscal year 1962. The increase was produced mainly by loans, which climbed from $175 million to $649 million, while grants rose only slightly, from $121 million to $139 million, and net other aid (surplus commodity sales) rose from −$29 million to $92 million.

Net military aid rose from $1,656 million in the fiscal year 1961 to $1,713 million in the fiscal year 1962, but its share of the total declined from 43% to 33% as a result of the much larger increase in economic forms of aid. Although figures for military aid to individual countries have not been released, regional totals show a continuation of the trend toward reducing this type of assistance for western Europe and increasing it for the less-developed areas of the world. Western Europe's share of total military aid decreased from 31% in the fiscal year 1961 to 24% in the fiscal year 1962, while that of the leading Far East and Pacific region rose from 43% to 49%.

Export-Import Bank Operations in 1962.—The Export-Import Bank of Washington (Eximbank), a government-owned corporation founded in 1934, fosters United States exports by a variety of financially sound loans, guarantees, and insurance arrangements of varying duration that avoid competition with private export financing. Eximbank expenditures are also included in the foreign aid total above, however, for some of the bank's operations also have the effect of augmenting aid programs by increasing total capital resources potentially available to the less-developed countries for purchases in the United States.

In the fiscal year 1962, Eximbank's project loans ran for periods of from 5 to 26 years, and most carried an interest rate of 5¾%. During the year the bank authorized $1,860 million in new credits, guarantees, and insurance, or $1,330 million when insurance and short-term guarantees are excluded. More than half of the latter sum, or $769.6 million, was authorized for the less-developed areas of the world: Africa, $126.5 million; Asia, $362.1 million (but over half to Japan); and Latin America, $336.0 million. Actual disbursements (from current and past authorizations) in the fiscal year 1962 totaled $942.7 million, of which $594.9 million went to Latin America.

Foreign Aid Program for the Fiscal Year 1963.—In his annual foreign aid message, sent to Congress on March 13, 1962, President John F. Kennedy called for the appropriation of $4,878.5 million in new funds to finance the operation of aid programs in the fiscal year 1963, but he requested only one major policy change in the basic legislation enacted in 1961. This was a proposal for the authorization of a separate long-term Alliance for Progress fund of $3 billion for the next four years, with $600 million to be appropriated for the fiscal year 1963. In the Foreign Assistance Act of 1962 (Public Law 87–565, approved on Aug. 1, 1962), however, Congress authorized only $600 million a year for four years, or a total of $2.4 billion for the Alliance for Progress fund. It authorized the expenditure of $1,818.9 million in new economic aid in the fiscal year 1963. In addition, funds already authorized for 1963 in 1961 ($1,250 million for development loans, $1,500 million for military aid, and $3.1 million for State Department administrative expenses) raised the total authorization to $4,572 million.

The act incorporated several major policy amendments that had been proposed by the House Foreign Affairs and Senate Foreign Relations committees or had been introduced in floor debate. What appeared to be the most important of these amendments were designed to:

(1) Prohibit aid to a nation when its government or government-controlled entity was indebted to a United States citizen or company, unless the president determined that continuation of aid was in the interest of the United States.

(2) Prohibit aid (except for United States-owned local currency for United States-supported hospitals, schools, and libraries) to any Communist nation, including Poland, Yugoslavia, and 16 other listed countries, unless the president determined and reported to Congress that such aid was vital to United States security, that the recipient was not controlled by the international Communist conspiracy, and that the aid would promote the recipient's independence from international communism.

(3) Require the president to establish procedures to ensure that United States aid would not be used to promote or assist aid projects or activities of the Communist bloc.

(4) Bar aid to the present government of Cuba or to any nation that assisted it, unless the president determined that such United States aid was in the interest of the United States.

(5) Require that the president suspend aid to any nation that after Jan. 1, 1962, nationalized, expropriated, or seized ownership or control of property owned by a United States citizen or any business in which a United States citizen had at least a 50% interest, or imposed discriminatory taxes or conditions that had the effect of seizing ownership or control of the property, and failed within six months to take appropriate steps (which might include arbitration) to discharge its obligations under international law to the former owner.

(6) Prohibit the president from waiving the provisions on the expropriation of United States property, unless he was satisfied that the foreign government was taking appropriate steps.

The second, fourth, and fifth of these amendments aroused the greatest contention, and many members of Congress urged further limitation of the president's power to waive the restrictions.

The Foreign Aid and Related Agencies Appropriation Act, 1963 (Public Law 87–872, approved on Oct. 23, 1962) provided funds to operate the aid programs in the fiscal year 1963 as authorized by Congress. It reduced the president's final appropriation requests by almost 21%, however, and it imposed several additional restrictions on his use of the funds. Two of the most strongly contested restrictions were extensions of the prohibitions in the authorization act on assisting Communist nations or those providing aid to the present government of Cuba. The appropriation act denied all United States aid to governments that provided military or strategic materials to Cuba. In addition, it denied economic aid to any nation that "sells, furnishes, or permits any ships under its registry to carry items of economic assistance to Cuba as long as it is governed by the Castro regime," unless the president determined that withholding such aid would be contrary to the interest of the United States. A similar set of amendments denied all arms, military equipment, and strategic items to Communist nations; it also denied economic assistance, but again permitted the president to continue such aid if he found it would be "contrary to the national interest" to withhold it.

Table 2—FOREIGN ASSISTANCE FOR THE FISCAL YEAR 1963: NEW FUNDS REQUESTED BY THE PRESIDENT AND APPROPRIATED BY CONGRESS[1]

(Millions of dollars)

Category of aid	Requested	Appropriated
Development grants	335.0	225.0
American hospitals abroad (special foreign currency program)	2.8	2.8
Investment guarantees	180.0	30.0
Surveys of investment opportunities	5.0	...
International organizations and programs	148.9	148.9
Supporting assistance	481.5	395.0
Contingency fund	400.0	250.0
Alliance for Progress	600.0	525.0

Administrative expenses (State Department)	3.1	2.7
Military assistance	1,500.0	1,325.0
Total	4,961.3	3,928.9

[1] In Public Law 87–872.

Table 2 provides a summary of funds requested by the president and appropriated by Congress. Public Law 87–872 also included $2,350,062,000 in funds for other international programs, as follows: Peace Corps, $59,000,000; civil administration of the Ryukyu Islands, $8,900,000; assistance to Cuban refugees in the United States, $70,110,000; migration and refugee assistance, $14,947,000; investment in the Inter-American Development Bank, $60,000,000; subscription to the International Development Association, $61,656,000; International Monetary Fund, $2,000,000,000; Philippine war damage claims, $73,000,000; international conferences and contingencies, $849,000; and U.S. Information Agency radio transmitter, $1,600,000. In addition, the act set a limit of $1,295,000,000 on the operating expenses of Eximbank, and one of $3,000,000 on its administrative expenses.

The Agency for International Development (AID), which administers economic aid, had been headed by Fowler Hamilton since its creation in 1961. He resigned on Nov. 7, 1962, and on November 28, David E. Bell, director of the Bureau of the Budget, was named to succeed him, effective December 7. On December 10, President Kennedy appointed a committee, named the Committee to Strengthen the Security of the Free World and

FOREIGN INVESTMENTS

The continued heavy outflow of private United States capital to foreign countries was paramount in raising total United States investments abroad by about $6 billion at year-end 1961. Direct investments, including the reinvested earnings of foreign subsidiaries, account for $2.5 billion of this growth, net purchases of foreign securities and medium-term loans for $1 billion, and short-term loans and acquisitions of liquid assets abroad for $1.5 billion.

Foreign assets and investments in the United States rose by more than $5 billion in 1961, continuing a trend which had been slowed in 1960. While more than $3 billion accumulated in United States corporate stocks held abroad, the bulk ($2.1 billion) was accounted for by appreciation of market values. Most of this market gain was wiped out in the first half of 1962. Short-term assets and United States government obligations held by foreigners rose by $2.3 billion in 1961, as compared with a rise of $2.1 billion in the previous year.

Preliminary data for 1962 show some slowing down in the rate of foreign investment, although the indicated totals are still above postwar averages. Direct investment flows abroad were affected by the unsettled conditions in many underdeveloped areas, particularly Latin America, by the oversupply for certain industrial raw materials, and by the slowing down of the rate of growth in Europe. Long-term government investments were, however, considerably above the previous year's level, which was affected by large repayments of loans.

Direct Investments.—During the first six months of 1962, direct investments abroad increased by about $1.2 billion. About one half of this total represented capital outflows, the rest being accounted for by reinvested earnings of foreign subsidiaries. With 1962 capital flows from the United States now expected to run at a slightly lower rate than the $1.5 billion invested in 1961, total earnings, as well as the amount currently being reinvested abroad, are rising. While the annual rate of growth of these investments is not greatly changed, a larger volume of funds is now generated internally

than before. Manufacturing industries were in the forefront of new developments, accounting for an increasingly important segment of the new investment dollar.

Canada.—The book value of direct investments in Canada was expected to reach $12.5 billion at year-end 1962, about $700 million above the 1961 total. At least one half of these new investments will be financed from internal resources with parent companies making available the remainder.

Final data for 1961 show that manufacturing, valued at $5.1 billion, remained the single most important industry in Canada, accounting for one half of all new investments. New investments in all other industries combined rose by about the same amount, with the bulk accruing to petroleum investments, which reached a total value of more than $2.8 billion.

Total expenditures by Canadian affiliates for plant and equipment in 1961 was $1,040 million. Projected expenditures for 1962 and 1963 are slightly higher, indicating no major changes in the volume and direction of capital flows from United States owners. Revised estimates of earnings of Canadian enterprises, which for several years had hovered around $700 million annually, were calculated at about $680 million for 1961. Lower earnings, together with increased distribution of income to United States owners, resulted in a considerably reduced level of reinvestment during the year.

Europe.—Despite the much reduced rate of growth of industrial production in Europe, American investment in Europe grew in the first half of 1962 at an annual rate of $1.1 billion, 10 percent above the previous year's volume. New United States business ventures continued to be attracted to the Common Market and, to a somewhat lesser extent, to the United Kingdom. In recent years investment has also grown rapidly in Switzerland, which has become a favored location for companies engaged in international trade and investment.

New investments in Europe are largely going into manufacturing and oil operations. In manufacturing, all industries are involved but those most favored by United States investors are the automotive, chemical, and machinery industries. Oil companies currently are investing heavily to add to their refining capacity, as well as for related facilities to transport, store, and market the increased product volume.

Latin America.—The renewed interest shown by United States companies in manufacturing investments in Latin America (about $0.2 billion annually) continued to be an important factor in 1961 and 1962. However, due to capital inflows from other industries in the early part of 1962, the overall net increase in 1962 may be less than in any recent year for this area. Because of the elimination from the totals of the investments previously listed for Cuba, the area total for 1961 was considerably reduced to $8.2 billion. The level of 1962 transactions is not now likely to bring this total much above the $8.5 billion mark by the end of the year. In order to implement the hemisphere's hopes for economic progress, further means have to be found to attract a sizable volume of private investment capital from the United States.

Much of the current expansion of manufacturing facilities has taken place in Argentina, where investments increased by $160 million. Panama, which continues to attract investments in international trade, also showed a marked growth of $60 million. The value of direct investments in Venezuela rose by about $450 million, mainly because of the revaluation of assets of a major oil company by more than $400 million.

Other Areas.—In North Africa, oil companies continued in their buildup of production facilities. Large-scale production is now in sight in Libya, where United States oil firms have spent more than $0.5 billion. Continued increases in oil production in the Middle East are bringing about a renewed flow of capital, needed partly to finance an increased volume of sales and to increase production and refining facilities.

Other Foreign Investments.—Outflows of private United States capital other than that connected with direct investments, and including purchases of foreign securities, bank loans, the financing of foreign trade, and the transfer of funds into higher-yielding liquid assets abroad, reached a record of $2.5 billion in 1961 ($2.2 billion in 1960). In the first half of 1962, these outflows were reduced and moved at an annual rate of $1.8 billion. Sales of foreign issues were up in 1962 to an estimated annual rate of $0.8

billion, as compared with $750 million in 1961. Medium-term foreign loans by United States banks again increased in 1961. Loans and credits extended by commercial firms also rose moderately.

Foreign Investments in the United States.—Foreigners added more than $5 billion to their United States holdings in 1961. Nearly one half of these new investments represented increased holdings of short-term assets and United States government obligations. This acquisition of liquid dollar assets had its origin in the continued favorable balance of payments position which foreign countries enjoyed vis-à-vis the United States. Most of the remainder was due to an appreciation during 1961 of the market value of United States corporate stocks owned by foreigners.

The growth rate of foreign direct investments in the United States accelerated somewhat during 1961 when $0.5 billion was added to these properties. About $0.2 billion of this total was accounted for by reinvested earnings, and $0.3 billion represented new foreign capital.

FOREIGN POLICY OF THE UNITED STATES

A series of continuing crises in Berlin, Cuba, and Vietnam; the dangerous situations in the Congo and Laos; and other conflicts in which the United States was less directly involved—in Kashmir, Angola, the China-India frontier, and the Israeli borders—all gave rise to high tensions in the public mind and serious concern on the part of the United States government in 1962.

All of these matters are dealt with in other articles in this volume, as are general issues important to the United States which developed in the United Nations or at international conferences. This article will deal mainly with the broad goals of foreign policy as set forth by President Kennedy and other high administration spokesmen.

The Basic Position.—The Kennedy administration's approach to the nation's fundamental relations with the rest of the world was outlined in the president's State of the Union message on Jan. 11, 1962. President Kennedy said: ". . . our nation is commissioned by history to be either an observer of freedom's failure or the cause of its success. Our overriding obligation in the months ahead is to fulfill the world's hopes by fulfilling our own faith.

"[We believe] that the state is the servant of the citizen and not his master.

". . . our basic goal remains the same: a peaceful world community of free and independent states, free to choose their own future and their own system so long as it does not threaten the freedom of others. Some may choose forms and ways that we would not choose for ourselves, but it is not for us that they are choosing. We can welcome diversity—the Communists cannot. For we offer a world of choice—they offer the world of coercion. And the way of the past shows clearly that freedom, not coercion, is the wave of the future. . . . Our instrument and our hope is the United Nations. . . ."

President Kennedy referred specifically to the Alliance for Progress with Latin America, the Agency for International Development, the Peace Corps, and the Food for Peace Program as means toward economic progress in the developing countries and the world generally; to factors strengthening the Atlantic community as an agency of free world security and economic progress; and to "the brave city of Berlin." ". . . The Allies have made it unmistakably clear that . . . the freedom of 2 million West Berliners would not be surrendered either to force or through appeasement." He believed a "peaceful and mutually acceptable resolution" of the problem could be found.

In his State of the Union message, President Kennedy gave equal weight to the peaceful coexistence of sovereign nations, each free within its own jurisdiction, and the freedom of individuals, whose rights in democratic theory would be prior to those of the state. The problem of resolving the conflict between these freedoms when outside intervention seems necessary to protect human rights figured in administration policy, both at home and abroad. A dilemma also was posed by the desire of the government, on the one hand, for activity and new initiatives in the interests of progress—moves likely to cause tension—and the recognition, on the other hand, of the need for order, stability, and a relaxation of tension.

Furthermore, steps for dealing with the East-West problem, which seemed to call both for defense of the free world and accommodation with the Communist world, might conflict with steps for dealing with the "North-South problem" through large-scale economic assistance to underdeveloped nations and international cooperation to that end. Finally, there was the need to reconcile action for strengthening regional groupings allied to the United States, such as the North Atlantic Treaty Organization and the Organization of American States, with action to strengthen potentially universal organizations, such as the United Nations and its specialized agencies.

Criticism by Eisenhower.—Partisan declarations before the November 1962 elections did not succeed in stopping politics at the water's edge until the Cuban crisis erupted in late October. In an address in Boston on October 15, former President Eisenhower quoted President Kennedy as saying that "during eight years of Republican administration our foreign policy drifted aimlessly about. [But] during the past months a new and firm and forward-moving foreign policy has been developed." Commenting on this "amazing burst of partisanship," the former president said: "Personally, I have been careful in all my speeches to keep current foreign policy out of partisan debates. But when a charge is made for purely political purposes, a charge that indeed should be stated in reverse, I must seriously question the advisability of continued silence."

Eisenhower then recalled "such names as Korea, Formosa, Quemoy and Matsu, Iran, Lebanon, Austria, Trieste and Guatemala, all triumphs of the clear, direct and courageous foreign policy, and the defeat of Communist efforts" as "items in the long list of successful efforts in eight years of a Republican Administration." He thought "the dreary foreign record of the past 21 months . . . too sad to talk about." But in the eight preceding years, he added, "we lost no inch of ground to tyranny." The former president doubted whether "anyone can persuade you that in the past 21 months there has been anything constructive in the conduct of our foreign relations to equal any part of that eight-year record."

Administration Claims.—The Kennedy administration denied the accuracy of this comparison. Accused on the one hand of indecision, complacency, theorizing, and appeasement, and on the other hand of provocativeness, intransigence, arms-racing, and belligerency, administration spokesmen sought to set the record straight by reference to what they called the sad inheritance that Republicans had left them because of mistakes in regard to Laos, Vietnam, Cuba, and Berlin, and to the positive Democratic achievements.

Among these achievements were listed the establishment of the Peace Corps, which had de-

veloped morale among Americans and goodwill in underdeveloped countries; and the Punta del Este (Uruguay) conference of January 1962, which had won inter-American support for opposition to communism in the hemisphere, for self-determination and nonintervention in American countries, for increased efforts to support the Alliance for Progress, for the exclusion of the Cuban government from the inter-American system, and for suspension of trade in arms with Cuba.

The administration also credited itself with the agreement reached among the powers for a neutralized Laos, stabilizing conditions in that country, and for developing a strong United Nations policy in the Congo. To the latter end the government had gained congressional support for purchase of half of a $200 million United Nations bond issue to cover the large expenditures required for forces in the Congo and the Middle

LE PELLEY IN THE CHRISTIAN SCIENCE MONITOR

"I've Changed My Mind—Let's Argue on the Bench!"

East. The administration also had gained congressional support for an Arms Control and Disarmament Agency to supervise research and operations in this field; for enlarged executive powers to negotiate reciprocal trade agreements which would make it possible to strengthen relations with the developing European Common Market and to weld the Atlantic community into an area of expanding economic prosperity and secure defense; and for substantial appropriations for economic aid to developing countries without the limitation originally supported by the House of Representatives with regard to Communist countries such as Yugoslavia and Poland.

Finally, the government claimed that a more adequate defense position had been achieved both in meeting local challenges, such as Berlin, Vietnam, and Cuba, and in general defense positions, as a result of which the comparative power position between the Soviet and Western blocs in the cold war had moved favorably toward the West.

Cuba and India.—Hemispheric support for United States policies was reaffirmed in Washington conferences among foreign ministers of American states both before and after the president's declaration on October 22 of stronger measures against Cuba. On September 4 the president had warned that if offensive preparations by the Soviet Union in Cuba were observed in addition to the defensive preparations then apparent, "the gravest issues would arise."

The president, in his radio-television address of October 22, drew attention to evidence of the preparation in Cuba of long-range missile sites and the presence of jet bombers, accusing the Soviet Union of deception in connection with the secret shipment of this material. He declared that the United States would establish a "quarantine" on further shipment of offensive arms to Cuba and would retaliate against the Soviet Union in case of nuclear attack from Cuba against any American country. A naval blockade was established the next day.

After intervention by Acting Secretary General U Thant, a contingent agreement was announced by the president on October 27 to the effect that if the missiles and bombers were removed from Cuba under inspection by United Nations observers, the United States would give assurances against invasion of Cuba. Although Cuban Premier Castro would not yield to Soviet efforts to permit inspection, the Russians promised to withdraw the offensive missiles and bombers by December 20, and the president announced the lifting of the "quarantine" on November 20.

The Soviet Union and some Western jurists criticized the United States for flouting the standards of international law and the UN Charter by establishing a naval blockade in time of peace, but the action was supported by the OAS and NATO, and by public opinion in the United States.

On October 20, in the midst of the Cuban crisis, India was invaded on its northern frontier by Communist Chinese forces. The United States immediately sent weapons to India, and this may have contributed to the cease-fire announced by China on November 21. The assistance, however, raised a controversy with Pakistan, which feared that this aid might upset the balance of power in the Kashmir dispute. The United States gave assurances that its assistance to India would be used only for defense against China, but anti-Anglo-American sentiment continued in Pakistan.

The Nuclear Threat.—President Kennedy, after a conference with British Prime Minister Harold Macmillan in April, characterized the joint three-stage proposal for disarmament as "the most comprehensive and specific series of proposals the United States or any other country has ever made on disarmament." In regard to banning nuclear tests, he said: "The United States does not intend to place its security and the security of its allies at the mercy of Soviet on-again, off-again tactics. We are ready to conclude an effective test-ban agreement now. But we cannot be led into another paper pledge."

Secretary of State Dean Rusk, on May 25, emphasized the need to adapt to the new factors of science, technology, and outer space, and to maintain the ideal of freedom, to break down trade barriers, and to build a world community of peace and order under law. After the start of nuclear tests in the Pacific in April, Rusk explained that it was necessary for the United States to renew atmospheric testing because of the Soviet refusal to accept a ban enforced by inspec-

tion. He also said that the Western right to have troops in West Berlin was derived from the "surrender of Nazi Germany" and was "not negotiable."

Speaking of disarmament, Rusk said on May 31 that "sweeping disarmament involves a major transformation of the world political scene," but added that negotiation must go on in spite of the stalemate. In answer to critics such as conservative Sen. Barry Goldwater, the secretary said that there could be no victory in a nuclear conflagration, and that the limitations in the use of military means must be recognized. He denied that the development of the Atlantic community and other diplomatic efforts around the world were "no-win"

(TOP) UPI; WIDE WORLD (BOTTOM) UPI; PICTORIAL PARADE

Top-level meetings with leaders of both East and West were an integral part of United States foreign policy in 1962. Shown here are (*upper left*) President Kennedy and Britain's Prime Minister Macmillan in Nassau, December 18; (*upper right*) Secretary of State Rusk and Soviet Foreign Minister Gromyko in Geneva, July 24; (*lower left*) Rusk and Foreign Minister Couve de Murville in Paris, June 19; and (*lower right*) Chancellor Adenauer of Germany in Washington on November 14 with (from left to right) Kennedy, Rusk, German Ambassador to the U.S. Knappstein, and German Foreign Minister Schroeder.

policies. On June 16, Rusk commented on the speed of technological change, especially in the race between offensive and defensive armaments; in the command problem as it relates to deterrents; and in the danger of war from accident or miscalculation. He insisted on the need for adequate inspection to assure observance of disarmament agreements, and cited the obstacle to negotiations in this field arising from the Soviets' identification of such inspection with "espionage."

Other Policy Statements.—Under Secretary of State George W. Ball said in February 1962 that foreign policy had to adapt itself to a rapidly changing technology, to the disappearance of empires, and to the end of isolationism for any country. The implications of economic interdependence called for liberal and cooperative economic policies among the free nations, he said.

George C. McGhee, under secretary of state for political affairs, on April 30 described in detail United States goals in foreign policy as: (1) strengthening the Atlantic community; (2) defending the frontiers of freedom throughout "the evolving world community"; (3) assisting the less-developed countries; (4) creating "a framework of interdependence among the members of the community through international organizations, trade, and private and public ties"; and (5) pursuing a policy toward Communist states to avert war. "Communist efforts to harass or frustrate the community of free nations" must be deterred, McGhee declared, and long-term constructive evolution in the Communist bloc must be promoted by offering incentives to bring about cooperation for common interests.

Chester Bowles, formerly under secretary of state, later adviser to the president on African, Asian, and Latin-American affairs, made a number of policy statements. He said in February that four global forces were shaping the world: (1) the revolution of rising expectations in underdeveloped countries; (2) the rise of the Soviet Union; (3) the transformation of mainland China; and (4) the accelerating development of science and technology.

In June, Bowles discussed the doubt expressed by Alexis de Tocqueville in the 1830's as to whether a democracy can successfully conduct foreign policy. Bowles commented on the common and the divergent opinions on foreign policy in the United States. Almost everyone, he said, is agreed that powerful armed forces are necessary, that war is likely to be suicidal, that the rising political and economic forces in Asia and Africa cannot be ignored, and that a policy of isolationism is impossible.

Among the divergencies, Bowles distinguished both the small groups of "trigger-happy extremists" who wanted war, and "men of good will" who wanted unilateral disarmament, from middle-of-the-road groups constituting 90 per cent of the population. He divided the latter into those who sought "maximum rigidity" and those who sought "maximum maneuverability." The first insisted that all states not allied to the United States should be treated alike, and opposed economic assistance to neutralist countries like India and Communist countries like Yugoslavia and Poland. The second group, with which he associated himself, distinguished among countries, avoided brinksmanship in the name of liberation, and appreciated that ideas and the opinions of people might often serve better than military weapons as instruments of foreign policy. In this connection, he distinguished three frontiers: the military, where "the two worlds are at swords' points"; the economic, where they compete; and the cultural, where they communicate.

Harlan Cleveland, assistant secretary of state for international organization affairs, said in addresses in April and May that he considered practice and operations more

important than principles and theory in the conduct of foreign policy. The former, he thought, were "sources of international law." Policies rapidly became obsolete in the changing world, but the government was trying to make the non-Communist world "hum with . . . success" to demonstrate to the Communists "that free choice works better, and feels better, than coercion." The United Nations, Cleveland said, must adjust its peacekeeping forces to particular situations. Its eight operations involving the use of force—Indonesia, Greece, Palestine, Kashmir, Korea, Middle East, Lebanon, and the Congo—had all been different, but all indicated a need for a permanent United Nations force.

This selection from the numerous policy statements of the Kennedy administration indicates vigorous thought in searching for effective and acceptable policies, and also points up the frequent difficulty in reconciling action—which foreign incidents and domestic opinion seemed to dictate—with the policies and principles asserted.

FORESTRY

Recreational use of forest land received increased attention in 1962. On January 31, the Outdoor Recreation Resources Review Commission (ORRRC) issued a report of its three-year study of recreation resources and needs, the most comprehensive review ever made of outdoor recreation in the United States. Establishment of this commission was authorized by Congress in 1958. Under the chairmanship of Laurence D. Rockefeller of New York, the commission was made up of eight congressmen and seven private citizens. Its report forecast an accelerating demand for outdoor recreation, while the resources necessary —forests, open spaces, shoreline, and unpolluted waters—will be diminishing because of demands for other uses. The commission recommended expansion of federal and state recreation programs, including establishment of a federal recreation agency, federal grants-in-aid to assist the states in recreation planning and development, and encouragement of private enterprise in providing recreation opportunities.

In line with ORRRC recommendations, a new Bureau of Outdoor Recreation was established in the Department of the Interior on April 2, 1962. (See CONSERVATION OF NATURAL RESOURCES.)

Forest recreation also had a prominent place in the discussions at the White House Conference on Conservation, called by President Kennedy on May 24–25, 1962, to "take stock of our national estate" and to "form a basis for more cooperation in conservation." The president, in his conference address, emphasized the importance of applying the discoveries of science to conservation. Robert C. Weaver, administrator of the Housing and Home Finance Agency, described his agency's efforts to encourage comprehensive urban planning and protection of open spaces for recreational use. Secretary of Agriculture Orville L. Freeman outlined proposals for governmental aid in land use adjustments to encourage "multiple use of private lands," including recreational developments on small watersheds, cooperative recreational and family forest projects, and rural renewal developments. These proposals were included in the 1962 farm bill in Congress, but were somewhat modified in the legislation finally enacted.

National Forests.—An expanded program for development of national forests was sent to Congress by the president. It embodied specific proposals for intensified management of recreation, timber, wildlife, and water resources, new roads and trails, and government acquisition of tracts within forest boundaries, especially those having recreational values. Proposed developments included 28,000 new camping and picnic grounds and 4,000 other recreation sites.

The Forest Service reported 102 million recreational visits to national forests in 1961, a 10% increase over the preceding year. Harvest of national forest timber under sustained-yield management in the fiscal year 1962 totaled 9,076,530,000 board feet with a valuation of $129 million, up some 700 million feet and $4 million over the fiscal year 1961.

Congress appropriated $123,530,000 for protection and management of national forests in the fiscal year 1963, an increase of $10.5 million over the amount appropriated for 1962. Additional funds for research, cooperative work, and other activities brought the total 1963 appropriations for the Forest Service to $223,295,000.

Edward P. Cliff became chief of the Forest Service in March 1962, succeeding Richard E. McArdle, chief forester for ten years.

Forest Fires.—With weather conditions more favorable in 1962, forest fire losses were held to a low level as compared with 1961. Western national forest regions, where fires swept large areas in 1961, reported 40% fewer fires and 85% less acreage burned in the first eight months of 1962. Throughout the national forest system, a total of 64,836 acres were burned up to the end of August 1962, compared with 206,231 acres in the same period of 1961.

International Forestry Developments.—A Working Group on Forest Insects and Diseases met in Ottawa, Ontario, in April 1962 to study ways and means of developing cooperation among the three members of the North American Forestry Commission—Canada, Mexico, and the United States. The working group had been set up at the first meeting of the commission which was organized in Mexico City in 1961 under sponsorship of the UN Food and Agriculture Organization. Current chairman of the commission is J. D. B. Harrison, Canada's deputy minister of forestry. At its Ottawa meeting, the working group agreed to undertake definition of major forest insect and disease problems, development of quarantine principles, and exchange of information.

At a joint meeting of the Society of American Foresters and the Canadian Institute of Forestry late in 1961, Dr. R. E. Balch of Fredericton, New Brunswick, and Dr. Paul J. Kramer of Durham, N.C., received awards for outstanding achievement in biological research contributing to the advancement of forestry.

FRANCE

Including small coastal islands and Corsica (3,367 square miles), metropolitan (continental) France has an area of 212,821 square miles. The country belongs to the United Nations, the North Atlantic Treaty Organization (NATO), and various European organizations (see EUROPE). Still associated with the world's second largest colonial empire, France by 1962 had its attention so riveted on the Algerian problem and the political struggle that concern for the Community (see FRENCH COMMUNITY) had almost passed from the public scene.

Population.—On March 31, 1962, the population of France was officially estimated at 46,300,000. The population of the major cities at the 1954 census was as follows: Paris, the capital, 2,820,534; Marseille, 605,577; Lyon, 462,657; Bordeaux, 250,306; Toulouse, 217,667; Nice, 208,453; Nantes, 197,915; Strasbourg, 193,353; and Lille, 190,078.

Government.—France is a parliamentary republic, in which, however, the powers of the president are very great. As a result of the Algiers revolt of May 13, 1958, Gen. Charles de Gaulle (q.v.) was recalled to power as premier, the parliamentary institutions of the Fourth Republic were suspended, and a new constitution was placed before the people in a referendum on September 28. Accepted by 81.7% of the voters in metropolitan France, the overseas departments, and the overseas territories, the Constitution of the Fifth Republic was promulgated on Oct. 4, 1958. An electoral college composed of 81,764 delegates, representing principally the 38,000 municipal councils, on December 21 chose de Gaulle for a 7-year term as president of the republic. He assumed office on Jan. 8, 1959.

The new presidency is by law, and still more by the nature of its first incumbent, more prestigious and powerful than that of the Third and Fourth republics. Theoretically, the conduct of the government rests with the premier (chosen by the president) and his colleagues, who are responsible to the National Assembly. In fact, since 1958 real power has lain with the presidency. This dualism in the executive branch makes possible a deadlock or clash between premier and president, but by reason of de Gaulle's sense of mission and popular support, the loyalty to him of Premiers Michel Debré and Georges Pompidou, and the paralysis of political life, a collision has not been realized. Moreover, 1962 witnessed such a political upset in the National Assembly and such a strengthening of the presidential hand that ministerial revolt against the president was more remote than before. Despite the opposition of nearly every articulate group in the nation, a law amending articles 6 and 7 of the constitution was approved by 62.25% of those voting in a popular referendum on October 28 (see below, *Events, 1962*). Henceforth the president was to be elected to a 7-year term directly by universal suffrage. An absolute majority of the votes cast must be obtained either on the first ballot or, as between the two leading candidates, on the second ballot one week later.

The premier and cabinet may be overthrown by a vote of censure adopted by an absolute majority of the National Assembly. The Algerian war and the presidential power to dissolve Parliament in this eventuality curbed the impulse until Oct. 5, 1962, when the Pompidou cabinet was overthrown. The assembly has had its powers considerably whittled down: its sessions are shorter than those under previous republics and have tended to become largely *pro forma*. While the powers of the Senate have been slightly increased beyond those of the former Council of the Republic, overall parliamentary control has been drastically reduced since 1958.

With the independence of Algeria, the National Assembly consists of 482 deputies, 465 representing metropolitan France, 10 the overseas departments, and 7 the overseas territories. Deputies are elected by direct universal suffrage for 5-year terms in a possible two-stage, single-seat district election. If no candidate receives a clear majority in the first round, a runoff election is held a week later, when a simple plurality suffices to elect. This system fosters political compromises in the interim week. The composition of the National Assembly after the elections of Nov. 18–25, 1962, and the subsequent regrouping of the parties was as follows:

Parties	Number of deputies
Union for the New Republic and Democratic Union of Labor (Gaullists)	230
Socialists	67
Democratic Center (Popular Republicans, Independents, and others)	53
Communists	41
Democratic Group (Radicals and others)	38
Independent Republicans	36
Others	17
Total	482

The Senate consists of 273 members, 255 representing metropolitan France, 7 the overseas departments, 5 the overseas territories, and 6 (chosen by the Senate itself) Frenchmen abroad. Senators are elected for 9-year terms (one third being renewed every three years) by indirect suffrage, the electors in a College of Notables representing the local governments rather than the mass of citizens directly. After elections on Sept. 23, 1962, the composition of the Senate was as follows:

Parties	Number of senators
Independents	83
Socialists	52
Democratic Left	51
Popular Republicans and Democratic Center	35
Union for the New Republic (Gaullists)	32
Communists	14
Others	6
Total	273

A Constitutional Council of 9 members, appointed for 9 years (3 by the president of the republic, 3 by the president of the National Assembly, and 3 by the president of the Senate) and renewing itself by one third every 3 years, rules on the constitutionality of organic laws and parliamentary regulations. An Economic and Social Council, appointed by the executive branch, gives advisory opinions on government bills, ordinances, and decrees.

For administrative purposes, France is divided into 90 departments, 311 arrondissements, 3,031 cantons, and 38,000 communes.

Religion.—The country is Roman Catholic in a formal sense, though inclined to be anticlerical, and the church enjoys no establishment. It is nevertheless true that relations between church and state under the Fifth Republic are better than at any time since their separation in 1905. There are 17 Roman Catholic archbishops and 68 bishops. Protestants number approximately 1 million.

Education.—Compulsory between the ages of 6 and 14, education is free in all elementary schools. Secondary education is also free and is available to students passing the entrance examinations for the 7-year *lycée* program, which leads to the baccalaureate degree and university education. In 1960–61, France had 6,100 state-operated infant schools, with 875,000 pupils, and 74,800 state-operated elementary schools, with 5,750,000 pupils. Enrollment in the *lycées* and *collèges* offering secondary education totaled 797,000. The 17 universities had 202,062 students in 1960. In 1960–61 private schools enrolled 15,000 infants, 1,086,000 elementary pupils, and 472,000 secondary students. There are 5 Roman Catholic institutes (universities).

Transportation and Communications.—The railways are run by the Société National des Chemins de Fer Français (SNCF), an autonomous corporation in which the government holds 51% of the stock. In January 1961, there were 24,144 miles of track. Approximately 65% of the traffic is carried over electrified lines. In 1961, 570 million passengers and 58,836 million ton-kilometers of freight were handled. In September 1962, the SNCF announced a $280 million investment and modernization program; all track was to be electrified or dieselized by 1970.

France had 50,200 miles of national, 174,000 miles of departmental and intercommunal, and 261,000 miles of local roads in 1960. In 1962 the Ministry of Public Works approved a 1,250-mile highway construction program (approximately 9,000 miles of existing major roads were to be widened), to be financed over the next 15 years by tolls and loans. On August 14, tunnelers from France and Italy met beneath Mont Blanc, although the 7.2-mile tunnel (the longest vehicular tunnel in the world) would not be completed before December 1963.

About one fourth of all goods is moved by water, and as of 1960 there were 4,821 miles of navigable waterways in use, including 1,994 miles of canals. The French merchant marine comprised 776 vessels of more than 100 gross tons, with a combined tonnage of 4,700,000 as of September 1961. Air France, the national airline, carried 3,055,500 passengers and handled 474,600,000 ton-kilometers of freight in 1960.

France had 4,357,937 telephones on Jan. 1, 1961. In 1962 there were approximately 10,500,000 licensed radio receivers and 3,059,574 television sets.

Economic Conditions.—In 1961 the French gross national product totaled 309.1 billion francs, as compared with 285.9 billion in 1960. In constant prices the increase amounted to 4.5% (compared with 6.3% the previous year). This slowing down of expansion was accounted for by the stagnation of agricultural output and by a reduction in the rate of industrial growth. Prices during the first half of 1961 were stable, but they rose thereafter as a consequence of poor fruit crops, increased de-

UPI

mand for wheat, and higher support prices for cereals. The franc, with a par value of 4.937 to the United States dollar, continued to maintain itself strongly, reflecting confidence in French finances at home and abroad. Gold and foreign exchange reserves, which stood at $2,070 million on Dec. 31, 1960, totaled $2,939 million on Dec. 31, 1961, and rose to $3,616 million by Oct. 31, 1962. Repayment of $293.4 million of long-term Marshall Plan loans to the United States was only part of a total $471.4 million in advance payments of foreign debts in 1962. By the middle of the year the total foreign debt had been reduced to $1,197.3 million.

The economy was healthy, but prospects for meeting the first-year goals of the Fourth Modernization and Equipment Plan (1962–65) were mixed: the Ministry of Finance and Economic Affairs projected a 5.7% rise in the gross national product for 1962, but rapid increases in consumption threatened investment and exports. The government might have to act to restrict private consumption. It did not plan to increase taxes in 1963, however, and hoped to keep the budgetary deficit under a manageable 7 billion francs. Commitments were heavy: 22% of the projected budget (about 84 billion francs) earmarked for the armed forces; an undetermined amount for the repatriation and resettlement of Europeans from Algeria; and civil service increases. Thus the tax promise might be better electioneering than economics. The inflationary spiral continued despite

AFP FROM PICTORIAL PARADE

Bank of France directives to banks to raise their reserves from 30% to 32%, effective Feb. 1, 1962, and government requests for wage stability (the labor shortage made this impossible).

Agriculture.—About 25% of the active population is agricultural; 65% of the farmers work their own land, and 25% employ permanent paid labor. In spite of favorable conditions, the 1961 harvest was smaller than that of 1960. Heavy rains in 1960 delayed wheat sowing, and the 1961 crop, though of higher quality, fell 14.4% below 1960. Although there was a shift from wheat to barley, barley production also declined, and dry summer weather reduced the corn crop and the wine yield. Sugar beet, tobacco, and fruit production decreased, but potatoes and some vegetables rose, and milk production was the highest on record. The output of major farm products in 1961 (in thousands of metric tons, with 1960 figures in parentheses) was as follows: wheat, 9,430 (11,014); barley, 5,377 (5,716); oats, 2,591 (2,735); rye, 346 (417); corn, 2,485 (2,813); potatoes, 14,821 (12,436); beet sugar, 1,704 (2,727); grapes, 6,924 (9,677); wine, 4,478 (6,311); apples, 2,228 (5,957); pears, 328 (542); and meat, 2,060 (1,930). Preliminary estimates for 1962 indicated that the wheat (11,148,000 metric tons), rye, and oats crops would exceed those of 1961. Corn and barley were expected to decline, while the sugar beet harvest would be good. Output of vegetables, fruit, fodder, and milk would be below the 1961 level, but the wine yield would be much larger.

Government agricultural policy in 1962 embraced modernization, development of export markets, and reduction of subsidies. Longer-range measures included farmers' pensions, land purchase and redistribution, and promotion of local industry, all with a view to reducing very small-scale and marginal farming (about 50% of the 2 million farms have less that 20 acres; 17%, less than 5 acres). The Fourth Modernization and Equipment Plan aimed at an annual increase of nearly 5% in production through improved techniques.

Industry.—About 50% of the gross national product is contributed by industry. The index of general industrial production (1958 = 100) increased from 116 in 1960 to 122 in 1961, and stood at 136 in June 1962, as compared with 128 in June 1961. The output of major industrial products in 1961 (in thousands of metric tons, with 1960 figures in parentheses) was as follows: coal and lignite, 55,260 (58,236); iron ore, 66,576 (66,912); pig iron and ferroalloys, 14,808 (14,340); crude steel, 17,568 (17,280); aluminum, 323 (279); zinc, 194 (189); cement, 15,684 (14,352); cotton yarn, 314 (314); wool yarn, 146 (143); and rayon filament yarn, 57 (55). Production of motor vehicles declined from 1,350,000 in 1960 to 1,202,400 in 1961, including 987,600 passenger cars, because of lower sales to the United States and Algeria. The output of electricity in 1961 amounted to 76,452 million kw.-hr. (72,120 million in 1960), and that of natural gas to 4,008 million cubic meters (2,844 million). Crude petroleum production rose from 11,400,000 metric tons in 1960 to 19,000,000 tons in 1961, of which 16,000,000 tons came from the Sahara.

Foreign Trade.—In 1961, French exports totaled 35,587 million francs (33,868 million in 1960), and imports 32,960 million (30,978 million); corresponding figures for the first 6 months of 1962 were 18,327 million and 18,876 million, respectively. Major customers outside the franc area in 1961 were West Germany, Belgium-Luxembourg, Italy, and the United States, in that order; principal suppliers, West Germany, the United States,

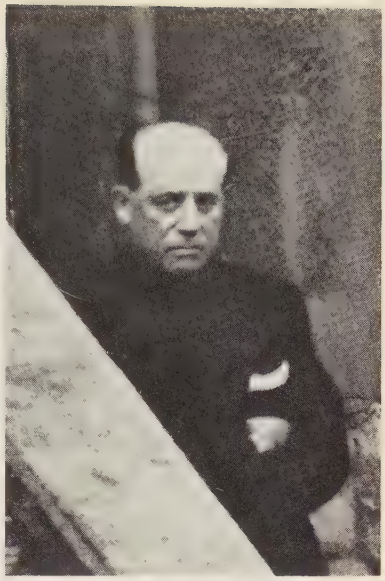
Belgium-Luxembourg, and Italy. Trade with other members of the European Economic Community (EEC; Common Market) was 14% higher than in 1960. Imports from the European Free Trade Association (EFTA; Outer Seven) rose by 24%, and exports to it by 8%. Exports to the franc zone declined by 8%; imports from it increased by 5%.

Events, 1962.—Two events dominated the year, each the achievement of Charles de Gaulle: the ending of the Algerian war, and the crushing of domestic political opposition to him. Surprisingly, the granting of Algerian independence, forced on France after nearly eight years of the worst colonial warfare any Western state ever knew, served to bolster his determination to remain in office to reshape the French regime. At year's end he could claim to have shattered parliamentary democracy as it had been known in France for almost a century. Never had French prestige in the 20th century stood higher; never had the political future of the country been so open to speculation. Freed at last from the hatred and violence of the Algerian disaster, Frenchmen approved their elderly leader and followed him across the ruins of the old political system into the unknown.

As 1962 opened, there was no doubt that the government was determined to conclude peace with the provisional government of the Algerian Republic (GPRA). Yet problems remained: What guarantees could be extracted for Europeans remaining in the new Algerian state? How could the murderous opposition to settlement from ex-Gen. Raoul Salan's Secret Army Organization (OAS) be destroyed?

On January 4, Salan called for insurrection against de Gaulle. French security forces were crippled by terrorists and by European citizens' refusal of cooperation. Muslims and Europeans favorable to settlement and independence were struck down. Algiers, Bône, and Oran were sealed off; curfews were introduced; search without warrants was practiced. In France, police raided hundreds of suspect right-wing homes, arresting scores of OAS supporters. Publication of OAS information was forbidden. From the pulpits came warnings against cooperation with terrorists. In Paris, the Communists staged demonstrations against "fascism" and *plastiquages* (plastic bombs), one of which, directed at André Malraux, blinded a child. A gigantic left-wing protest on February 8 involved such a melee when security forces dispersed the demonstrators that 8 persons died and hundreds were injured. Massive, silent demonstrations on February 12, and on the occasion of the 8 victims' funeral the next day, testified to the insanity of the OAS and the brutality of the suppression of left-wing protests against it. In Algeria, terrorists seized army supplies and sent death threats to foreign journalists and Europeans seeking to leave the country without OAS permission.

Secret talks with the GPRA continued. The president, assailing Salan and his band on February 5, promised that a settlement would come "very soon." Algeria would become "a sovereign and independent state." Louis Joxe, minister of state for Algerian affairs, and Belkacem Krim, meeting at Les Rousses on February 11–18, agreed on a cease-fire and establishment of a Transitional (Provisional) Executive. The French cabinet gave its approval on February 21; the agreements were accepted by the GPRA on February 20, and by the National Council of the Algerian Revolution on February 22–27. Final compromises were hammered out between Joxe and Krim at Évian-les-Bains on March 7–18. At 5:30 P.M. on March 18, the cease-fire was signed, effective at noon the next day.



Awaiting trial in Paris, Raoul Salan is shown in prison. The former chief of the terrorist Secret Army Organization, sentenced to life imprisonment on May 23 on charges of treason, was indicted on a separate charge of subversion, June 25.

PARIS MATCH

Terms provided for the release of prisoners within 20 days; a general amnesty; strict exclusion of armed forces from political action; gradual abrogation of emergency measures; establishment of a French High Commission and a 12-member Transitional Executive under French sovereignty until future political status was decided in a referendum; guarantees for French citizens in an independent Algeria; a three-year period within which Algerians must choose to remain French or to become Algerian; safeguarding and preferring of French oil interests, with "organic" French and Algerian exploitation of Saharan fields; a 15-year lease on the Mers-el-Kébir naval base, open to renewal; French rocket and nuclear testing bases and Saharan airfields to remain in French hands for five years; arbitration of disputes; Europeans to have proportional representation in Algerian representative assemblies and specified administrative rights in Algiers and Oran for four years; and economic, financial, technical, and cultural cooperation between France and independent Algeria.

These terms were close to total French capitulation. At once, Ahmed Ben Bella and four other rebel leaders, held since their 1956 kidnaping, were released. De Gaulle appealed immediately for popular approval in a referendum (set for April 8) to "satisfy the mind of France." On March 19, Christian Fouchet was appointed high commissioner, and the cabinet approved the establishment of the Transitional Executive headed by Abderrahmane Farès. All this, Premier Benyoussef Ben

Parisians pay homage on February 14 to four of eight persons killed in February 8 riot protesting continuing terrorism in France by right-wing Secret Army Organization.

WIDE WORLD

Khedda said on March 18, was "a great victory for the Algerian people." On the same day, however, Salan madly proclaimed OAS determination to annihilate the "Algerian rebellion," and ordered a general strike for March 19.

Murder, massacre, and reprisal followed. French military police had grenades hurled at them. On March 23, de Gaulle ordered the terrorists crushed without pity. Troops poured into Oran and Algiers and, in one shocking incident on March 26, mowed down demonstrating Europeans in Algiers' Rue d'Isly. Farès appealed on March 30 for reason, but warned that terror "will lead you nowhere." As de Gaulle called (March 26) for a referendum demonstration "that we are capable of resolving with determination a major problem of our time," the OAS warned (March 28): "There will be no quarter now; it's guerrilla war now." When Salan's deputy, ex-Gen. Edmond Jouhaud, was caught on March 26 and flown to Paris, ex-Gen. Paul Gardy took his place in western Algeria. Strikes and killings continued.

On April 8, the French accepted the Évian accords by 90% of the votes cast. The OAS was defiant, and terror continued for 10 weeks more. Neither French forces nor the National Liberation Front (FLN) mastered the killers. Salan himself was seized on April 20 and flown to Paris. Gardy succeeded him, although the principal OAS leaders were ex-Colonels Yves Godard and Jean Gardes and a former deputy, Jean Jacques Susini. In Paris, Jouhaud was tried by a special military tribunal on April 11–13, and condemned to death (the sentence was commuted to life imprisonment on November 28). From the underground, Georges Bidault promised on April 12 that his National Council of Resistance would fight to save France from the "dishonor and tyranny" of de Gaulle (on July 27, Bidault was stripped of his parliamentary immunity). Perhaps 4,000 had been slaughtered by the OAS since January 1. A massacre of 62 Algiers longshoremen on May 2 brought the hitherto disciplined Muslims to the point of running amok.

Striking defiant poses, Salan faced his judges (all threatened with death) in Paris on May 15–23. His brilliant right-wing lawyer, Jean Louis Tixier-Vignancour, embarrassed former Premier Michel Debré, a witness, and produced the decision that, as a result of unspecified "extenuating circumstances," Salan receive only life imprisonment. Furious, de Gaulle dissolved the tribunal, interpreting the proceedings as an assault on himself and an encouragement to the OAS. Indeed, despite arrests and appeals, terror continued. But the civilian leaders around Susini split from the military diehards around Gardy. Alternating between truce offers and scorched-earth threats, assailed by Jouhaud's death-cell pleas, the OAS broke up. De Gaulle created a new military tribunal on June 1. The Susini faction and the FLN reached an accord on June 17. Premier Georges Pompidou's cabinet approved it on June 21, but refused amnesty for terrorists in France. Because of left-wing pressure from Ben Bella, Ben Khedda criticized the pact. Oran, Bône, and Sidi-bel-Abbès remained intransigent, but the cease-fire took effect in Algiers. On June 20, Gardes accepted the truce. By contrast, Gardy broke off negotiations in Oran on June 22 and embarked on a wild scorched-earth orgy.

In the Algerian referendum on July 1, 5,975,581 voted for independence and cooperation with France, and 16,534 voted against. On July 3, de Gaulle announced that "France solemnly recognizes the independence of Algeria." Sovereignty was transferred to the Transitional Executive, the High Commission was dissolved, and Jean Marcel Jeanneney became the first ambassador to the new republic. The tricolor still flew over French military and naval establishments in Algeria, but 132 years of rule had ended. Susini and his followers rallied to the new state; Gardy and his fled Oran. The war was over. On August 28, Joxe and Farès signed agreements providing for teachers, technicians, and other civil servants to be recruited in France; continued use of the French Treasury and Bureau of the Budget as Algerian agents in financial matters; joint exploitation of Saharan resources; guarantees of French preference in Saharan minerals; adoption of the French petroleum production and marketing codes; and a joint agency to supervise overall production.

The consequences of the lost war for France did not end on July 3. The panic flight of Europeans continued, spurred on by reprisals, kidnapings, and property destruction by Muslims seeking revenge. Ambassador Jeanneney's complaints could not halt fear and retribution. By the end of October, about 750,000 out of approximately 1,000,000 Europeans living there on January 1 had fled to France. Some, bent on revenge against de Gaulle, now added to the 42,090 terrorist attacks of the war period, which had killed 16,378 Muslims and 2,788 Europeans (an additional 13,296 Muslims and 375 Europeans were missing). Plots against de Gaulle were numerous, and many suspects were arrested. (See also ALGERIA.)

At 8:10 P.M. on August 22, driving through Petit-Clamart to Villacoublay Airport, de Gaulle, with his wife and son-in-law, had about 150 bullets pumped into his car; six of them hit it, and the president was missed by inches. Letters mailed from the National Assembly post office applauded the attempt in the name of Bidault's council. While six men, led by Henri Maunoury, were being sentenced to long prison terms for the attempt on de Gaulle of Sept. 8, 1961, others were arrested in September for the Petit-Clamart ambush. A French air force engineer, Jean Marie Bastien-Thiry, confessed to being the leader of the plot. The anti-Gaullist network extended across western Europe. Jacques Soustelle and Bidault, expelled from Italy in August and September, disappeared from view (on December 8, it was disclosed that a warrant had been issued for Soustelle's arrest). If their agents were encouraged by the assembly's challenge in toppling Pompidou on October 5, and by the Council of State's ruling the special military tribunal unconstitutional on October 19, they had the government's assurance that it would hunt them down. The massive electoral triumph of the president in November rendered their cause all the more insane.

Early in the year it became clear that de Gaulle did not intend to retire once the war ended. With a settlement in sight, he moved toward constitutional revision to strengthen the executive branch. The debate on March 20–21 on the Évian accords, ending with conflicting shouts of "treason" and "OAS assassins," could not have improved his view of the National Assembly; nor could its less than enthusiastic approval of Pompidou's cabinet on April 27 (259–128, with 119 abstentions), a reflection of parliamentary disapproval of de Gaulle's rumored plans. On June 8, the president informed the nation that "at the proper time" it would "have to make sure that, in the future and above and beyond men who pass, the republic may remain strong, well ordered, and continuous." This meant popular election of the president. Irritation increased, reflected in assembly opposition to de Gaulle's insistence on a confederation of states, "a Europe of fatherlands,"

Security guard examines rooftops for signs of a possible assassination attempt on President de Gaulle (center), shown touring central France in May.

PARIS MATCH

rather than a supranational union of peoples. On June 13, 293 deputies left the chamber in protest against government refusal to permit a vote on foreign policy.

Opposition flared when the plan to submit constitutional reform (popular election of the president) directly to the people in a referendum was announced. All but the Gaullist Union for the New Republic (UNR) claimed that Article 89 required parliamentary amendment. De Gaulle argued on September 20 that his successor would need a mandate "directly from all citizens" to ensure the authority of the state. The struggle thus was joined. On October 4, de Gaulle requested a vote to "tell me if I can and if I should pursue my task in the service of France." Most responsible voices in the country called it blackmail. After a 15-hour debate on October 4–5, the assembly (280–190) censured and overthrew the government. Paul Reynaud, 84, who first brought de Gaulle out of obscurity nearly 30 years before, made a bitter reply to Pompidou. The assembly was dissolved by a decree published on October 10. Elections were fixed for November 18 and 25.

With the state radio and television at his service, de Gaulle conducted open war on the old parties. In speeches on October 18 and 26, he denounced them and "their regime of misfortune," and renewed his threat, if the referendum were "feeble, mediocre, or doubtful," to resign "right away and without return." The opposition was given only the briefest radio and television time to make its case on October 22 and 23. The non-Communist opposition promised a coalition government in the event of de Gaulle's retirement. The referendum, held on October 28, gave the president a 62.25% approval; 37.75% voted against. Taking account of 23.03% abstentions, 46.66% of the electorate accepted revision; 28.29% rejected it. The president was pronounced satisfied, but the opposition considered that he had suffered a measure of defeat; certainly the margin of approval was less than expected.

Thus the parties went into the election campaign hopefully. On November 7, de Gaulle denounced them as "the parties of yesteryear," and appealed for massive backing of the UNR, without naming it. Stung by charges that they had brought on the disasters of 1940 and 1958, the opposition lashed out at the president for "cheating with history and with truth." It did them no good; no more than did the Socialist promise to vote Communist, if necessary, in the second ballot to defeat UNR candidates. November 18 was a disaster for the opposition; among the casualties were Reynaud, Pierre Mendès-France, and, on the far right, Pierre Poujade. The Gaullist landslide was confirmed on November 25. If Debré was defeated, the Pompidou cabinet as a whole was returned. The Gaullists obtained majority control of the assembly, the first such party victory in modern times. Significantly, the Communists increased their seats from 10 to 41; the Socialists, theirs from 43 to 67; and the Radicals, theirs from 36 to 44. But the Independents were stricken, dropping from 123 to 50, and the Popular Republicans (MRP) fell from 57 to 38. Clearly the UNR, with 230 seats (majority control of the assembly was assured by nonconformist Independents, Radicals, and MRP members pledged to de Gaulle), had scored off these two parties. Thus the UNR was oriented to the right, but any new party stability depended on its finding a program or at least breaking up into recognizable political units. The last vestige of parliamentary control of the presidency was gone.

The nation could look back on numerous ministerial changes during the year. On January 18, Wilfrid Baumgartner resigned as minister of finance and economic affairs, handing over his office to Valéry Giscard d'Estaing. On April 14, following the Évian settlement, Premier Debré resigned, and the president entrusted the government to his banker friend and adviser, Georges Pompidou; 19 ministers were carried over from the Debré cabinet, while 10 were newly appointed. Protesting de Gaulle's sarcastic dismissal of their integrationist position as "mythical" in a press conference on May 15, 5 MRP ministers (Pierre Pflimlin, Robert Schumann, Robert Buron, Paul Bacon, and Joseph Fontanet) resigned on May 16. Pompidou quickly reorganized the cabinet. When the Independents in the assembly condemned the president's European policy on May 22 and ordered their cabinet members (Giscard d'Estaing, Louis Jacquinot, Raymond Marcellin, and Jean de Broglie) to resign, the four men refused and broke with their party. Christian Fouchet became minister delegate in the cabinet on September 11. On October 8, it was revealed that Pierre Sudreau had resigned as minister of education in protest against the president's constitutional plans. After the elections, on November 27, Pompidou was reappointed premier. His cabinet, announced on December 6, had only three new members.

Relations with the Western powers in 1962 were cordial, but affected by a determined French pursuit of parity in the Atlantic alliance and leadership in Europe. Relations with West Germany were especially good. De Gaulle and Chancellor Konrad Adenauer met briefly on February 15 at Baden-Baden. On July 2–8, Adenauer visited France, where he was courteously but unenthusiastically received from Paris to Bordeaux to

Reims. He and de Gaulle announced their intention to conclude discussions on a European political federation "as soon as possible." More spectacular was de Gaulle's visit to Germany on September 4–9. A public triumph from Munich to Hamburg, his progress was royal, marked by enthusiasm bordering on frenzy.

Less warm were relations with Great Britain, bedeviled still by the problem of Britain's entry into the EEC. Apparently, Adenauer and de Gaulle had agreed to try to achieve their European political federation during 1963; then the United Kingdom could enter the EEC by January 1964. Assuredly the president preferred a "little Europe," excluding Britain. Since the Common Market was making such heavy weather in London during 1962, prospects for better relations with France were not bright. Prime Minister Harold Macmillan conferred with de Gaulle at the Château de Champs on June 2–3, but each government gave a different version of the talks. In vain, Macmillan visited France again on December 15–16. Meanwhile, de Gaulle's continued opposition to European integration made relations with Italy, Belgium, and the Netherlands lukewarm. The year closed with de Gaulle (and his aged German friend) blocking the road toward "creating Europe."

Relations with the United States remained stiff. In response to United States pressure for greater cooperation, de Gaulle refused to consider integration of the forthcoming nuclear striking force. France, he remarked at Limoges on May 20, was "not in the tow of another state." Hoping to obtain French cooperation for the United States trade position vis-à-vis the EEC, Generals Maxwell D. Taylor and James M. Gavin supported the sale of United States nuclear equipment to France. Maurice Couve de Murville, minister of foreign affairs, observed on June 13 that, while France alone could not defend herself and Europe, French, European, and American forces had to achieve "a new equilibrium." Secretary of State Dean Rusk's visit to Paris on June 19–21 was without result here. So the dialogue continued, the French insisting on nuclear independence, the Americans warning against "competing and conflicting strategies" in the West.

In many ways, large and small, the state of France indicated its vigor and progress. It sent the splendid Atlantic liner *France* past the Statue of Liberty on February 8. With Great Britain it undertook (November 29) a gamble on a jointly designed supersonic transatlantic jet plane. It carried out an underground nuclear explosion in the Sahara on May 1. Moved by the three-week hunger strike of 74-year-old anarchist and pacifist Louis Lecoin, it finally agreed in June to recognize the status of conscientious objectors; it prepared to cut its military strength from 700,000 to 500,000 men. With four times as many cars on the roads as a decade earlier, with three fifths of the population possessing savings accounts, with 5 million refrigerators and French cooking succumbing just a little to snack bars, with wine yielding slightly to soft drinks, brandy to scotch, and alcoholism to temperance, the French were prosperous and at peace for the first time in more than 20 years.

The last president of the Fourth Republic died on November 22, marking the end of an era. But the first president of the Fifth Republic, fresh from the most stunning electoral triumph any French politician ever had, could not, unhappily for France, refrain from presiding over the funeral on November 27 with bitter words for the parliamentary regime they buried that day in Normandy with René Coty.

FRENCH COMMUNITY

By 1962 the French Community had little but economic and cultural significance. The structure of the Community relationship had evolved to the point where it was merely contractual. This had been the wish of the African states themselves; French opinion did not resist the inevitable. Editorials in the French press showed acceptance of the fact that, while there would always be a special connection between France and her former African colonies, everything had now been swallowed up in the generic problem of emancipated black Africa's relations with the West.

THE FRENCH COMMUNITY[1]

Division	Area (sq.mi.)	Population[2]
French Republic:		
Metropolitan departments	212,821	46,300,000
Overseas departments:		
French Guiana	35,135	32,000
Guadeloupe	687	276,000
Martinique	425	283,000
Réunion	970	346,000
Overseas territories:		
Comoro Islands	838	185,000
French Polynesia	1,544	76,000
French Somaliland	8,500	68,000
New Caledonia	8,499	78,000
St. Pierre and Miquelon	93	5,000
Wallis and Futuna Islands	49	9,900
Other member states[3]:		
Central African Republic	238,200	1,227,000
Republic of Chad	495,750	2,680,000
Republic of Congo	132,000	900,000
Gabon Republic	103,100	448,000
Malagasy Republic	228,000	5,577,000
Republic of Senegal	76,124	2,980,000
Total	1,542,735	61,470,900

[1] Outside the Community proper is the Anglo-French condominium of the New Hebrides, which has an area of 5,700 square miles and an estimated population of 61,000. The French Southern and Antarctic Territories (1960 pop., 103), former dependencies of Madagascar, comprising Adélie Coast in Antarctica and the Crozet Islands, Kerguelen Islands, St. Paul Island, and Amsterdam Island in the southern Indian Ocean, constitute an overseas territory that received special status in 1955. [2] Latest population estimates from Statistical Office of the United Nations, *Population and Vital Statistics Reports*, Statistical Papers Series A, vol. 14, no. 4 (October 1962). [3] Six other republics—Republic of Dahomey, Republic of Ivory Coast, Republic of Mali, Islamic Republic of Mauritania, Republic of Niger, and Republic of Upper Volta—remained outside the framework of the Community after attaining their independence in 1960; all have signed bilateral agreements of cooperation with France, as has the Federal Republic of Cameroun, a former French trust territory.

While the Algerian war continued, the new Community nations were divided on that issue. Mali took sides with the Casablanca group (Guinea, Ghana, Morocco, and the United Arab Republic) against the Monrovia group (this group's French-speaking members are the Brazzaville group of Senegal, Ivory Coast, Malagasy Republic, Gabon, Niger, Central African Republic, Mauritania, Cameroun, Dahomey, Congo, Chad, and Upper Volta). During the Lagos Conference, which was held on January 25–30 to draft a charter of loose confederation, the Casablanca group stayed away because no representative of the Algerian rebel government had been invited.

The Monrovia group of states, on the other hand, showed their sympathy with President Charles de Gaulle's efforts to end the war and their recognition of the fact that France must in all ways be their principal source of supply.

Despite President Modibo Keita's refusal to appear at Lagos, Mali demonstrated the elasticity of the Community by entering negotiations for consular, economic, financial, and monetary cooperation with France; the conventions were signed in Paris on February 2. Mali and France would enjoy reciprocal tariff preferences, and Mali would remain in the franc area and receive aid for its five-year development plan. On May 12, agreements establishing a West African Monetary Union were initialed in Paris by France, Dahomey, Ivory Coast, Niger, Mauritania, Senegal, Upper Volta, and Mali. These states agreed to set up a new African Financial Community franc, pegged at one fiftieth of the French franc. A Central Bank, presided over by an African, would issue notes guaranteed by France. On June 30, however, Mali announced its withdrawal and established its own bank. Yet it confirmed the earlier decision to remain within the franc area and announced talks for monetary cooperation with France.

Toward the year's end, when a French delegation was to arrive in Conakry for talks, even Guinea (which had chosen instant independence in 1958) loomed on the Community horizon. The Guinean evolution away from the Soviet bloc pointed up the fact that, whatever the burden of historical memory and the ideological convictions involved, French-speaking African states stood to gain by association with France and the European Economic Community (EEC). The Brazzaville group's conference at Libreville, Gabon, on September 11–14 showed progress toward rapprochement with the Casablanca group. De Gaulle's telegram of good wishes underlined the happy prospects still open within the French Community idea. If Great Britain joined the EEC, cooperation between France and her former colonies would be the more harmonious, for the hesitations of the new English-speaking African states in the Monrovia group would disappear.

In the meantime, there was no doubt about the interest of French business and the French government in the Community. While the formal structure of the Community had vanished, there remained a network of self-interest and the living and strong, if less tangible, connection with a common cultural tradition.

FRENCH GUIANA

Situated on the northeastern coast of South America, this French overseas department has an area of 31,135 square miles, and a population (1961 est.) of 32,000. The population is of mixed Negro, Caucasian, and Asian descent along the coast, and comprises descendents of former Negro slaves and aboriginal Indians in the interior. Roman Catholicism is the principal religion. Cayenne (est. pop., 13,362) is the capital and chief port.

The department is administered by a French-appointed prefect (René Erignac), assisted by an elected 15-member General Council. The economy is based on subsistence agriculture, supplemented by gold and timber production. The chief crops are cassava, corn, breadfruit, and yams. Sugarcane has been introduced with some success. Total exports in 1961 were valued at 378 million francs; imports, 7,745 million francs. Chief exports (in million francs): gold, 143; timber, 109. Chief suppliers were France and the United States; chief customers were France, Guadeloupe, and Martinique.

FRENCH GUINEA. See GUINEA.

FRENCH LITERATURE

The *Journal* of Jules Michelet, the great French romantic historian, published in its entirety for the first time (vol. 1, 1959; vol. 2, 1962) was one of the most discussed items of 1962. Michelet died in 1874 at the age of 76. His extraordinary *Journal* reveals some unknown aspects of him as a writer and projects new light on his life with his wife, Athénaïs. In Michelet's mystical and scientific mind, his young wife came to have the same importance as history, which was a religion with him. Athénaïs fills the pages of the second volume of the *Journal*, in which he attempts a systematic and objective study of her personality.

Another important publication of the year was a new, complete edition of André Breton's *Manifeste du surréalisme*, the occasion for a re-evaluation of surrealism. Most critics, looking back on the literature of the last 30 years, agreed that the surrealistic movement exerted an extraordinary influence which is still very conspicuous in literature and the arts.

The Novel.—The New Wave continues to bring to the shores of literature interesting experimental works, even though some of the better-known exponents of this style (Robbe-Grillet, Marguerite Duras) are busy translating it for motion pictures. The most original work was perhaps that of Marc Saporta, *Composition numéro un*. This novel, like Raymond Queneau's *Cent mille milliards de poèmes* (1961), is not one but a great number of books. It consists of 150 pages which the reader can reshuffle as he wishes. The general public becomes in a way the novelist; the reader builds the story as he sees fit, and can change it as often as he pleases.

In spite of the success of the New Novel, the traditional novel is still quite healthy because the mass of the reading public still prefers plots which can be easily understood. Academician Henri Troyat's *Les dames de Sibérie*, a long realistic novel about a French woman married to a Russian at the time of the 19th century czars, is a best seller. André Dhotel's *Les mystères de Charlieu sur Bar* is another of those sentimental, slightly mystical novels, the characters of which are born of a dream and a myth, and which reminds us of the *romans courtois* of the Middle Ages.

Robert Merle's *L'Île* is, on the more superficial level, an historical novel in the tradition of *Mutiny on the Bounty*. At the end of the 18th century a band of mutineers flee Tahiti, where the British Admiralty could have found them too easily, and settle, with a few Tahitians, on a small desert island of Oceania, to which they bring their racial prejudice, their egotism, and their ambitions. The small society is almost completely engulfed by death and destruction. Merle's novel is not only a good, lively adventure story; it is a well-written meditation on man and the problems of man's involvement in evil.

Poetry.—Poetry was very much in the literary news in 1962. The Prix des Critiques, awarded in recent years to first-rate novelists such as Albert Camus, Françoise Sagan, and Alain Robbe-Grillet, in 1962 was given to a 38-year-old poet, André Du Bouchet, for his collection *Dans la chaleur vacante* (1961). Du Bouchet, who is also known for his excellent translations of the works of Friedrich Hölderlin, Shakespeare, and James Joyce, writes a compact and severe, but fresh, nonlyrical poetry which is sometimes reminiscent of René Char. In his short poems

he creates a new surrealistic world which tries to abolish all distinctions between height and depth, proximate and distant, exterior and interior.

Several important collections of poems were published during the year. *Vents et poussière,* by Henri Michaux, gathers poems written between 1955 and 1962. In this small but important book, the author of *Plume* continues his exploration of the deeper recesses of thought. He tries to capture images of the realm of dream and nightmare, and to explore in its infinite waverings the constant oscillation of a will-o'-the-wisp consciousness. Jean Grosjean's *L'Apocalypse,* André Frénaud's *Il n'y a pas de paradis,* and Jean-Claude Renard's *Incantation du temps,* attest to the diversity of French contemporary poetry. Grosjean's poems are obscure and apocalyptic, and combine a very personal inspiration with an exceptional knowledge of the great Judaic, Islamic, and Christian texts. Frénaud, on the contrary, is attentive to reality and to daily life; his poetry is effusive and sometimes violent. Finally, Renard is a poet of Christian inspiration. His book opens on an Augustinian quotation: "Là où est la Charité rien n'est à l'étroit." ("Where there is Charity there is no constraint."). Like Claudel, he sings of the Creator, the creature, and all creation.

Theater.—Jean Anouilh's most recent plays, *La foire d'empoigne* and *L'orchestre,* are minor but very entertaining works. *L'orchestre* is a psychological study of a second-rate girls' band. *La foire d'empoigne* is a semihistorical play about the year 1815 in France. In a farcical but most convincing way, Anouilh shows that great men of history are over-fond of drama; they enjoy being the stars of a big show, whatever the cost to the simple men, the enthusiastic victims of hero worship.

Marcel Aymé's *Les maxibules* is one of the best comedies by that author. A poetic, tender, ironical work, it is a satire on many kinds of foolishness. Françoise Sagan's new work, *Les violons parfois,* was, like *Château en Suède* (1960), a brilliant, sophisticated, rather thin play, which will probably not be remembered as a masterpiece of its times.

Nonfiction.—Among the many works of literary history and criticism were Renée Kohn's erudite, brilliant *Le goût de La Fontaine,* the late Marcel Thiébaut's *Entre les lignes,* and Robert Kemp's *La vie des livres.* Pierre de Boisdeffre's *Dictionnaire de littérature contemporaine, 1900–1962* is extremely useful because it gives biographical and critical information on most of today's authors.

FRENCH OCEANIA. See FRENCH POLYNESIA.

FRENCH POLYNESIA

Comprising some 125 islands scattered over a wide area in the south-central Pacific, French Polynesia is an overseas territory of the French Republic. The territory is composed of five principal archipelagoes: the Society Islands (divided into the Windward Islands and the Leeward Islands); the Tuamotu Islands (or Low Archipelago); the Gambier Islands; the Marquesas Islands; and the Tubuai Islands (or Austral Islands). Clipperton Island, 670 miles southwest of Mexico, is administered as part of the territory. Tahiti (area, 402 square miles; pop., 36,326), the principal island, is 3,660 miles southwest of San Francisco. The aggregate land area of French Polynesia is 1,544 square miles, and the population (1961 est.) is 76,000. Papeete (1956 census pop., 17,288), on Tahiti, is the capital and chief port.

The government is headed by a French-appointed governor (Aimé Grimald), who is assisted by a 7-member Government Council and a 30-member Territorial Assembly, elected every five years by universal suffrage. The ordinary budget for 1961 was balanced at 637 million francs CFP; the extraordinary budget, at 61 million francs CFP (63.64 francs CFP equals U.S.$1). In 1961 there were 133 public and private elementary schools (with 18,021 pupils), and 8 secondary schools (1,942 pupils).

The economy of the territory is based on the production of copra, vanilla, coffee, phosphates, and mother-of-pearl shells. Exports in 1961 totaled 1,035 million francs CFP; imports, 2,097 million francs CFP. Principal exports (in million francs CFP): phosphates, 442; copra, 266; vanilla, 178; and pearl shell, 86. Principal customers in 1961 were France, New Zealand, and the United States; principal suppliers were France and New Zealand.

FRENCH SOMALILAND

Situated in northeastern Africa on the Gulf of Aden, French Somaliland is an overseas territory of the French Republic. Its area is estimated at 8,500 square miles, and the population (1961 est.) is 68,000, composed mainly of Muslim Danakils and Somalis. Djibouti (pop. 41,000) is the capital, a major bunkering station, and a free port. The government is headed by a French-appointed governor (Jacques Compain in 1962), assisted by an 8-member Government Council and a 32-member Territorial Assembly, elected by universal suffrage. The government budget for 1962 was balanced at 1,022 million Djibouti francs; the extraordinary budget, at 332.9 million (214.4 Djibouti francs equal the U.S. dollar).

The economy of the territory is based on trade and centers about Djibouti and the Franco-Ethiopian railway. The remainder of the country is inhabited by nomadic herdsmen. About 89% of the land is desert. Total exports in 1961 were valued at 337 million Djibouti francs; imports, 3,620 million. The major customer was France; major suppliers were France, Great Britain, and Aden.

FRENCH SOUTHERN AND ANTARCTIC TERRITORIES

A French overseas territory in the southern Indian Ocean and Antarctica, French Southern and Antarctic Territories include St. Paul Island (3 sq. mi.), Amsterdam Island (16 sq. mi.), the Kerguelen Islands (2,703 sq. mi.), and the Crozet Islands (193 sq. mi.), in the Indian Ocean; and Adélie Coast (estimates vary from 150,000 to 200,000 sq. mi.) on the Antarctic continent.

Formerly dependencies of Madagascar, the territories were constituted a French overseas territory with special status on Aug. 6, 1955. They are under the control of an administrator (Pierre Rolland in 1962), who is assisted by a Consultative Council which meets in Paris. Scientific stations have been established in some of the territories, but there is no permanent population.

FRIENDS, RELIGIOUS SOCIETY OF

Several Friends (or Quakers) attended the World Council of Churches Assembly in New Delhi, India, November–December, 1961. Present were delegates from three Quaker bodies which are members of the council: the Friends General Conference and the Five Years Meeting of the United States, and the Canada Yearly Meeting. The London Yearly Meeting, which has never joined, sent observers. When the assembly adopted a more restrictive statement defining the basis for membership, the Quaker delegates voiced their opposition, reaffirming the traditional objection of Friends to all definitive creedal statements.

From April 29 to May 1, 1962, over 1,000 Friends and others gathered in Washington, D.C., for a Friends Witness for World Order. Vigils, interviews with officials, and public meetings were climaxed by a discussion between President Kennedy and a delegation of six Friends.

The American Friends Service Committee spent about $4.5 million for its activities of international service, community relations, youth activities, and peace education. Over $1 million was spent on re-

lief for Algerian refugees in Tunisia and Morocco. In the summer of 1962 the committee was asked by the new Algerian government to help in resettlement of refugees and others who had been held in camps within Algeria. The committee established 20 centers for relief, for training young people in literacy and other skills, and for restoring homes and farms. The committee also held its second experimental international seminar for youth, co-sponsored by the USSR Committee for Youth Organization.

Jessamyn West published *The Quaker Reader*, an anthology of writings by and about Friends. An hour-long television program about Friends was presented by NBC on July 30.

On invitation from Pope John XXIII, the Friends World Committee appointed Richard K. Ullman of England to attend the Second Ecumenical Vatican Council, beginning in October 1962, as an observer.

FROZEN FOODS. See FRUITS; VEGETABLES; and the Index entry, *Frozen Foods.*

FRUITS

Production of 20 major fruits in the United States in 1962 remained close to the 1961 level of 18,767,000 tons, the highest in a decade, according to the Statistical Reporting Service of the U.S. Department of Agriculture. Production of noncitrus fruits was down less than 1% from 1961, but was 6% above average. The sour cherry crop set a record and cranberry production was the second largest on record. Only the apricot, prune, fig, and olive crops were below average.

The 1962–63 citrus season began with prospects for increased production over the preceding year, including a record orange crop, but severe freezes in Florida in December 1962 caused extensive damage.

U.S. PRODUCTION OF FROZEN FRUITS

Product	1960	1961
	1,000 pounds	1,000 pounds
Apples and applesauce	69,853	80,117

Bearing acreage for noncitrus fruits in 1962 was higher than in 1961. Acreage for eight major deciduous fruits—commercial apples, peaches, pears, grapes, cherries, plums, prunes, and apricots—totaled 1,710,900, higher than in any of the preceding five years, but lower than in other postwar years. For seven minor fruits—figs, nectarines, olives, avocados, dates, persimmons, and pomegranates—bearing acreage was 92,300, highest of the postwar period. Acreage for the six citrus fruits—oranges, tangerines, tangelos, grapefruit, lemons, and limes—totaled 795,600, down 17,100 from 1961 but close to the level of the postwar period.

Apples.—The 1962 crop of 121,390,000 bushels was 4% below the preceding year but 10% above average. The crop included 5,234,000 bushels of summer varieties, 11,790,000 of fall varieties, and 104,366,000 of winter varieties. Leading individual varieties were: Delicious, 28,777,000 bushels; McIntosh, 16,636,000; and Rome Beauty, 9,167,000.

Peaches.—Production of 76,351,000 bushels in 1962 was 2% below that of 1961 but 16% above the 1951–60 average. The national total included 30,627,000 bushels of California clingstones, which are used mostly for canning.

Pears.—The crop of 29,102,000 bushels was about average, although 7% above 1961 production. About 26,300,000 bushels of the nation's crop was produced in the three Pacific coast states.

Texas	124	135	40

[1] Estimates of the commercial crop refer to total production of apples in the commercial apple areas of each state. (Source: Statistical Reporting Service, U.S. Department of Agriculture.)

Grapes.—The fourth largest crop on record was produced in 1961—3,148,350 tons, 2% above the 1961 crop and 6% above the 10-year average. Of the national total, 2,862,100 tons consisted of European-type grapes grown principally in California and Arizona. California's 1962 crop included 640,000 tons of wine varieties, 580,000 tons of table varieties, and 1,630,000 tons of raisin varieties. Production of raisins amounted to 178,400 tons (dried basis), 50,000 tons less than the year before.

Plums and Prunes.—Production of plums in California and Michigan fell 7% below 1961 to 88,500 tons, but was slightly above average. The United States prune crop totaled 443,000 tons, 27,800 tons more than the year before, but 10,370 tons below the 1951–60 average.

Cherries.—A record sour cherry crop of 179,190 tons was produced in 1962, 8% more than in 1961 and 42% above the 10-year average. Sweet cherry production also increased, with the 109,200 ton 1962 crop 8% above the preceding year and 24% above average.

Apricots.—The 1962 crop fell 12% below the 1961 crop and 16% below average to a total of 168,600 tons. Poor weather in California caused most of the decline.

Dates.—California's output of 22,500 tons in 1962 was 5% above 1961 production and 11% above average.

Olives.—An average crop of 50,000 tons was produced in California in 1962, but it was 14% more than the year before.

Figs.—The 1962 crop of 64,400 tons (fresh basis) was slightly above 1961, but 22% below average. Acreage was at the lowest level of recent years.

Avocados.—The 49,400 ton 1962 crop was 12% below the preceding year but 10% above average.

Cranberries.—The 1962 crop rose 8% above that of 1961 and 24% above average to 1,335,000 barrels, a total exceeded only in 1960. Massachusetts produced 58% of the United States output.

Nectarines.—The California crop of 50,000 tons was 4,000 below the 1961 record, but exactly double the 1951–60 average. Bearing acreage continued to increase, although the rate slowed.

Strawberries.—Production of 515,453,000 pounds in 1961 was 1% above the 1961 crop and 10% above average. Of the total crop, 56% was used fresh and the remainder went to processors. These were about the same percentages as in 1961.

U.S. CITRUS PRODUCTION, BY LEADING STATES
(1,000 boxes)

	Average 1951–60	1961	1962[1]
Oranges:

[1] Preliminary, based on conditions as of Dec. 1, 1962. Season begins with the bloom of the year shown and ends with completion of harvest the following year. (Source: Statistical Reporting Service, U.S. Department of Agriculture.)

Citrus Fruit. *United States Crop.*—Record orange production for the second consecutive year was in prospect early in the 1962–63 season. The Statistical Reporting Service of the Department of Agriculture estimated the crop at 149,645,000 boxes, 8% more than 1961–62 output, and 20% above average. The estimate was based on conditions as of Dec. 1, 1962, and did not allow for damage from freezing weather in Florida later in the season. California's output increased sharply, but production in Texas and Louisiana fell to very low levels as a result of the freeze the preceding winter. The 1962–63 crop included 78,015,000 boxes of early, midseason, and navel oranges and 71,630,000 boxes of Valencias.

Grapefruit production was estimated at about 42,500,000 boxes, according to early prospects. This was slightly below the preceding year and the 1951–60 average. The lemon crop of 14,000,000 boxes fell 16% below that of 1961–62 and 8% below average. Tangerine production rose from 1961–62, but the tangelo crop was 20% lower.

World Citrus Production.—A new world record in production of oranges and tangerines was set in 1961–62, according to the Agriculture Department's Foreign Agricultural Service. Most of the increase came in the United States and the Mediterranean area.

Lemon production also increased; the world crop of 41 million boxes was about 5 million larger than production from the bloom of 1960. The 1961–62 lime crop also was greater, but grapefruit production fell slightly below that of the preceding year.

New plantings indicated the possibility of much larger crops of oranges, tangerines, and lemons in the future. On the other hand, little change seemed likely for grapefruit and limes.

WORLD PRODUCTION OF CITRUS FRUITS
(1,000 boxes)

	Average 1951–55	1960	1961[1]
Oranges and tangerines	315,149	380,158	403,370
Grapefruit	47,219	49,759	49,320
Lemons	30,910	36,615	41,360
Limes[2]	3,382	4,288	4,420

[1] Preliminary. [2] Egypt, Mexico, and United States only. Northern Hemisphere harvests begin in November of year shown and Southern Hemisphere harvests in May following year shown. Production in foreign countries converted to boxes of the following weights: oranges, 70 pounds; grapefruit and limes, 80 pounds; lemons, 76 pounds. (Source: Foreign Agricultural Service, U.S. Department of Agriculture.)

U.S. Foreign Trade.—Exports of fruit and fruit products rose from $253,520,000 in the fiscal year 1961 to $282,082,000 in the fiscal year 1962, according to the Economic Research Service. Fresh oranges and tangerines, the biggest single item, were valued at $37,277,000, almost $1.5 million more than a year earlier.

Imports also increased in the fiscal year 1962, totaling $168,161,000 compared with $163,372,000 in the preceding year. Bananas accounted for $77,981,000 of the 1962 total.

FUR INDUSTRY

A continued rise in fur-consciousness, aided by the mode for trimmed fashions, kept activity in the United States fur industry at a high level in 1962. Mink continued to lead in sales over all other furs, but there was a marked increase in interest in other species.

Furs worn by such prominent women as Mrs. John F. Kennedy, Queen Elizabeth II, and movie actress Elizabeth Taylor revived demand for leopards and gave a great impetus to spotted furs in general. Somali leopard enjoyed such popularity that choice skins were bringing as much as $1,000 each.

Total federal excise tax collections (10% of the retail price) for the fiscal year ended June 30, 1962, amounted to $30,921,000, as compared with

$29,226,000 in the 1961 fiscal year and $30,207,000 in 1960.

Prices of ranched mink rose from $16.41 in 1961 to $18.11, partly because of the steepness of the drop in 1961, and partly because of a resurgence of demand, particularly for such colors as dark ranch, white, and pastel.

Worldwide mink production in 1961 exceeded 14 million pelts, of which the United States accounted for 6,727,000. The respective increases over 1960 were 16% and 4%. Imports into the United States were only slightly more than the previous year's 3.5 million, but exports went down about 10%. Both Scandinavia and Canada shipped fewer mink to the United States, but remained its biggest suppliers. The 1961 Annual Survey of Manufactures noted that shipments of dressed and dyed furs in the United States were valued at $14,839,000, compared with $15,582,000 in 1960.

The vogue for trimmings vastly improved sales of many long-haired furs, such as wolf, lynx, fox, raccoon, and opossum. At the same time, new dyeing techniques revived interest in Persian lamb. Mink, however, retained an estimated 70 to 75% share of retail fur sales.

GERMANY—A glimpse of the barricade in East Berlin is revealed by a bomb hole in the Berlin wall on May 25.

UPI

GABON

An independent state on the Atlantic coast of central Africa, the Gabon Republic is a member of the French Community (q.v.). Its estimated area is 103,100 square miles. The population (1962 est.) of 550,000 consists mostly of Bantu ethnic groups and includes about 1,500 persons of foreign origin, mainly French. The official language is French. Chief cities are Libreville, the capital (1961 pop., 31,000), and Port-Gentil (26,000).

Government.—This former French overseas territory within French Equatorial Africa became independent on Aug. 17, 1960. The constitution of Feb. 17, 1961, provides for a president and a 67-member National Assembly elected by compulsory universal suffrage for a 5-year term. In the election of Feb. 12, 1961, candidates of the government-bloc parties were approved by a virtually unanimous vote, and Léon M'Ba, head of the dominant Democratic Party, was elected president for a 7-year term.

Education and Religion.—Education is compulsory up to the age of 16. School enrollment, 1959: 51,924 (32% of the school-age population). Number of schools (with enrollments): primary, 377 (49,816, or 80% of the school-age population); secondary, 13 (1,659); teacher-training, 2 (327); technical, 1 (122). Many persons in the coastal areas are Christians, but animism prevails among the tribes of the interior.

Finance.—The estimated budget for 1962 was balanced at 6,008 million francs CFA, or about $24 million (246.85 francs equal U.S.$1), slightly above the figure for 1961.

Transportation and Communications.—Gabon has no railroads, but a joint railroad and cableway are under construction from the manganese mines near Moanda to a junction with the Congo-Ocean Railroad in the Republic of Congo. The principal means of inland transport is the Ogooué (Ogowe) River, navigable for 100-ton barges to a point 155 miles from the Atlantic. Most towns are connected by all-weather roads, aggregating 2,590 miles. Libreville and Port-Gentil, the chief ports, have international airfields. Radio receiver licenses numbered 20,000 in 1959.

Agriculture and Forestry.—About half the labor force is engaged in agriculture, the chief subsistence crops being manioc, bananas, corn, taro, and yams. Cacao is the most valuable cash crop and third-ranking export item (2,271 metric tons exported in 1960); other cash crops are coffee, peanuts, rice, and palm products. The mainstay of the economy, however, is the $32 million lumber and wood industry. Gabon is the leading world supplier of okoumé, a softwood used for veneer and plywood (782,000 metric tons produced in 1961); hardwoods (mahogany, kevazingo, and ebony) also are exported.

Manufactures and Minerals.—Manufacturing is limited chiefly to lumber and agricultural processing industries (rice, palm oil, coffee). Mineral production in 1961 was valued at $15.6 million; the increase of 70% over 1960 was due largely to the start of uranium production near Mounano by a French company (969 metric tons of 30% uranium ore extracted in 1961). Petroleum is produced near Port-Gentil by American, Dutch, and French firms (774,000 metric tons in 1961). (See also below, *Events, 1962.*)

Foreign Trade.—Gabon is one of the few tropical African states showing a consistently favorable balance of trade. Declared exports, 1961: 13,530 million francs CFA (up 15% from 1960); imports: 8,853 million (up 11%). Logs and lumber provided well over half the value of external trade; mineral products, over one fourth. France was Gabon's leading customer (55% of exports) and supplier (60% of imports).

Events, 1962.—A French planning concern under contract to the Gabonese government released the draft of a seven-year (1963–69) development program to cost $67 million. The plan calls for increased lumber and agricultural output, labor training, and the development of small industries. Construction of a paper plant and a 20,000-kw. hydroelectric station at Kinguele Falls, on the M'Beï River, are the chief projects.

A Franco-American firm began producing manganese at Moanda in October, following completion of the cableway and railroad outlet to Pointe-Noire, in the Republic of Congo; an annual output of

750,000 metric tons of 48% manganese ore is anticipated. A consortium of Canadian and European investors has undertaken to exploit the vast high-grade iron ore deposits around Mékambo (1 billion metric tons of 60–64% iron).

Relations between Gabon and the Republic of Congo (Brazzaville) were strained in September after violent demonstrations in the two countries against each other's nationals. False reports that a Gabonese soccer team had been attacked by mobs in Brazzaville kindled latent anti-Congolese resentment in the Gabon capital. The ensuing riots and expulsion of 3,000 Congolese citizens touched off counter-demonstrations in the Congo.

GALAPAGOS ISLANDS. See ECUADOR.

GAMBIA

Situated on the Atlantic coast at the most westerly part of the "bulge" of Africa and enclosed on three sides by Senegal, Gambia Crown Colony and Protectorate is the only British dependency in West Africa. The colony (area, 29 square miles), situated at the mouth of the Gambia River, comprises St. Mary's Island and the division of Kombo St. Mary on the mainland. The protectorate (3,974 square miles) extends inland for some 200 miles along both sides of the Gambia River and varies in width from 15 to 30 miles. Total area: 4,003 square miles; population (mid-1961 est.), 290,000. The capital and chief port is Bathurst (est. pop., 24,000).

Government.—The governor (John W. Paul, appointed Dec. 16, 1961) is chairman of an Executive Council composed of the prime minister and eight ministers drawn from the legislature. The House of Representatives consists of 32 members elected by the chiefs in assembly, and two nominated members without vote. The speaker and deputy speaker are elected by the House. In general elections of May 1962 the Progressive People's Party won 18 seats; its leader, David K. Jawara, was appointed prime minister on June 4, 1962.

Education and Religion.—School enrollment, 1962: 9,670. Number of schools (with enrollments): 58 primary (7,700); 5 secondary (1,870); 1 teacher-training (100). About 85% of the population is Muslim; the remainder is Christian and animistic.

Finance.—Government revenue, 1962 est.: £1,602,000, excluding a British grant-in-aid of administration of £639,999; recurrent expenditure, £2,356,000; expenditure under the development budget, £972,000.

Transportation and Communications.—Long-distance transport is chiefly by river steamer, as there are no railroads. Highways aggregate 750 miles (including 120 miles of all-weather roads). Three airlines make scheduled flights from Yundum Airport (near Bathurst) to West African countries and the United Kingdom.

Economy.—Gambia's one-crop economy is based on the production of peanuts. Exports of shelled peanuts totaled 51,100 tons in 1961. About 80% of the population is dependent largely on subsistence agriculture.

Foreign Trade.—Total exports, 1961: £3,374,000; imports, £4,572,000. Peanuts account for more than 90% of total export value. Minor exports include palm kernels, hides, and dried fish. Principal imports are textiles, machinery, vehicles, and foodstuffs.

Events, 1962.—A new constitution providing for responsible self-government was introduced in June. The crown-appointed governor retained responsibility for security, external affairs, and public service. Prime Minister Jawara has pledged to attain independence for Gambia in 1963.

A visit to Bathurst in midyear by Premier Mamadou Dia of Senegal resulted in agreement to expand the scope of the Gambia-Senegal Inter-Ministerial Committee, which studies common practical and technical problems. It was announced on October 27 that the two governments had asked the United Nations to study the possibility of establishing "some form of association" between the two countries when Gambia becomes independent.

Venezuela	146.69	156.43	171.90	182.53

[1] Excluding gas used for repressuring, as well as gas flared, vented, or otherwise wasted. [2] Including gas for repressuring and gas wasted. [3] Estimate. (Source: U.S. Bureau of Mines.)

The following data are based on figures compiled by the U.S. Bureau of Mines and supplied by the American Gas Association. The marketed production (gross production minus the quantities consumed in repressuring, venting, and wasting) of natural gas in the United States increased 4% in 1961 over 1960. In the first half of 1962, marketed output was 6,858 billion cubic feet, compared with 6,575 billion cubic feet in the first half of 1961.

Consumption of natural gas in the United States by the 47 states using it in 1961 was as follows (in billion cubic feet): residential, 3,249 (up 5%); commercial, 1,077 (up 6%); industrial fuel, 6,714 (up 5%); field use, 1,881 (up 6%); and carbon black, 161 (down 19%).

Gross injection to underground storage in 1961 was the same as in 1960 (about 844 billion cubic feet) according to Bureau of Mines data. Withdrawals decreased from 713 billion to 698 billion cubic feet in 1961.

In 1961, interstate shipments (including imports and exports) totaled 7,949 billion cubic feet,

GEM STONES

The United States continued to provide a substantial market for diamonds and other precious stones in 1961, although its output was small. The value of imports of gem stones into the United States in 1961 was $222,715,000, compared with $192,488,000 in 1960, an increase of nearly 16%. The imports in 1961 were principally diamonds, including 2,274,923 carats of rough and uncut stones valued at $114,670,000, and 839,150 carats of cut (unset) diamonds valued at $78,605,000. Gem diamonds comprised 87% of the total imports. The data do not include industrial diamonds (see ABRASIVES). Other imports included cut emeralds and natural and cultured pearls (chiefly the latter). Exports of gem stones, precious and semiprecious, were valued at $14.8 million, compared with $7.6 million in 1960. Re-exports in 1961 were valued at $28 million, compared with $21.7 million in 1960.

World sales of gem and industrial diamonds, through the Central Selling Organization (London) totaled a record $268 million in 1961. No breakdown between gem and industrial sales was given.

The United States produced a wide variety of semiprecious and ornamental gem stones in 1961, the value of which was estimated at $1,309,000, an increase of $121,000 over 1960. Gem material and mineral-specimen output was reported from 45 states, with 11 states producing 85% of total value. Production of diamonds at the "Crater of Diamonds" in Arkansas was 121 carats, valued at $7,260. A new amethyst mine in North Carolina began operating in 1961. Also found in the state were a 14-ounce pink sapphire (estimated at 2,000 carats of cuttable stone), and a 24-ounce ruby (with many flaws, but estimated at 800 to 1,200 carats of cuttable stone).

GENERAL ASSEMBLY, U.N. See UNITED NATIONS.

GENETICS

The 1962 Nobel Prize in physiology and medicine was awarded to F. H. C. Crick of Cambridge University, James D. Watson of Harvard University, and Maurice H. F. Wilkins of the University of London for their work on the chemical structure of genetic material. John C. Kendrew and Max F. Perutz of the Cavendish Laboratory, Cambridge University, received the Nobel Prize in chemistry for their studies on globular proteins. (See also NOBEL PRIZES.)

Cracking the Genetic Code.—Protein synthesis has been studied in vitro by adding to a suspension of ruptured bacterial cells all 20 of the usual amino acids in L form, along with different single-stranded ribonucleic acid (RNA) polymers.[1] When the added RNA came from tobacco mosaic virus (TMV), the protein synthesized had the same characteristics as the protein normally found in TMV, demonstrating that the information in TMV-RNA has the same meaning in a bacterial cell-free system as it has in a live tobacco plant. This and other evidence suggest that the messenger RNA code for amino acids is essentially identical in all organisms.

One of three winners of 1962 Nobel Prize in medicine, English biochemist Maurice Wilkins is shown with a model of DNA molecule at New York press conference, October 18.

WIDE WORLD

Pure RNA polymers were synthesized in vitro. The four usual nitrogenous bases in ribonucleic acid are adenine (A), cytosine (C), guanine (G), and uracil (U). When polyribonucleotides containing only adenine (A) or cytosine (C) bases were added to the cell-free protein-synthesizing system, no additional protein was made. The addition of the polyribonucleotide containing only the base uracil (U), however, functioned as a messenger RNA, causing the protein poly-L-phenylalanine to be synthesized. This discovery marked the first crack in the RNA code. The results demonstrated that a sequence of one or more U's in messenger RNA encodes L-phenylalanine, and that certain other sequences are meaningless for encoding amino acids. This work also confirmed what was evident from the TMV-RNA study, namely, that the RNA need not be interrupted in order to encode the successive amino acids in a polypeptide chain.

Mixed polyribonucleotides were synthesized in vitro with different ribonucleotides arranged in an essentially random linear sequence. All contained, besides U, different proportions of A, G, and C. When added to the protein-synthesizing system, it was found that although no amino acid required the presence of all four of these bases for incorporation into protein, some required three of these, others two, and phenylalanine only one. The simplest explanation is that sequences of three ribonucleotides (triplet coding units, or codons) encode amino acids. (See chart of triplet amino-acid codes in the article BIOCHEMISTRY.)

It is generally found that one or more of the bases in each triplet of messenger RNA must be U; the sequence of the bases in different triplets is, however, still largely unknown. The code is degenerate, in that different messenger RNA triplets may result in the incorporation of the same amino acid. Degeneracy has been found to result from: (1) mutations in DNA segments specifying either transfer ribonucleic acids (sRNA) or the enzymes activating these to accept individual amino acids for transport; and (2) the incorporation of faulty components into sRNA.

An amino-acid-coding triplet in messenger

[1] For a description of the functions of ribonucleic acid (RNA) and deoxyribonucleic acid (DNA) in protein synthesis, see THE AMERICANA ANNUAL, 1962, pp. 79 and 295–6.

RNA probably has a complementary triplet (generally containing at least one A) in sRNA. Messenger RNA seems to be the RNA complement of but one of the strands in a deoxyribonucleic acid (DNA) double helix, each of the triplets of which is expected to contain at least one A.

Operons.—In a number of organisms, the sequence of nucleotides in a segment of single-stranded DNA, which serves as template for the synthesis of a unit of messenger RNA, is apparently long enough to carry the information for encoding two or more polypeptide chains or proteins. Such a segment of DNA comprises an operon, a linear sequence of genes whose protein end products are under the all-or-none control of an operator gene located at one end of the nucleotide sequence.

While it is not known with certainty how the operator gene turns off and on the functioning of all the genes in its operon, there are several possibilities. For example, the operator gene may control whether or not messenger RNA is to be made from its operon; it may determine the sense or nonsense nature of the messenger produced; or a given messenger may make sense or no sense depending on a subsequent action at its operator end. Whatever the mechanism, inactivation or functioning of an operon always occurs sequentially, beginning at the operator end and proceeding along the rest of the strand. The operator can mutate so that the entire operon is always functional, always nonfunctional, or sometimes functional and sometimes nonfunctional. In the last case, the operator DNA or its messenger complement appears to be sensitive to the presence of a repressor substance made by a regulator gene located within or outside of the same operon, or to the presence of a non-gene-produced substrate.

GEODETIC SURVEY. See COAST AND GEODETIC SURVEY.

GEOGRAPHY AND EXPLORATION

Exploration of the earth is far from ended, even though skyscrapers are rising in the Mongolian People's Republic and atomic energy provides light and power in Antarctica. Expeditions in 1962 continued to explore the polar regions, to conduct oceanic research, and to climb mountain peaks. In many parts of the world, where nature has not been generous with resources, scientists were seeking ways of improving conditions to support the rapidly growing population. The arid lands were receiving special attention.

Arid Land Research.—While trying to make better use of areas that are now dry, it is also essential to prevent the spread of deserts into regions now used for farming. At a symposuim held in Rome, UN Educational, Scientific and Cultural Organization (UNESCO) scientists showed that the Sahara has moved about 1,500 miles south in the past 4,000 years. While climate has changed somewhat, it is agreed that human misuse of the land has contributed most to expansion of the dry lands of North Africa and the Middle East. Many of the inhabitants of these regions are illiterate nomads, and it is difficult to persuade them to change their age-old customs.

Among gigantic schemes for increasing the water supply in Africa is the Aswân High Dam in Egypt, scheduled for completion by 1970. In its third year of construction in 1962, it was slightly ahead of schedule. About 400 Soviet technicians were at the site. When the dam is completed there will be a new industrial complex at the site, about 1 million acres of irrigated land will be provided, and electricity will be plentiful and will cost about one third as much as at present. Behind the dam there will be a lake 300 miles long. The town of Aswân is growing rapidly and had about 50,000 inhabitants in 1962. A separate Nile River project is the 10-mile-long South Sudan Dam being constructed about 360 miles from Khartoum. It will provide additional irrigation water for Sudan cotton farmers, as well as electricity.

In the United States, a giant earth dam has been completed to retain 2,100,000 acre-feet of water on the west side of the San Joaquin Valley in California. This is the first stage in the $511 million Central Valley Project.

Conversion of salt water to fresh is receiving attention in many parts of the world. The main problem is to produce large enough quantities at a low cost. On St. Thomas in the U.S. Virgin Islands, equipment is now producing 250,000 gallons a day of water that contains only 3 parts of salt per million gallons of water. The cost of water in the locality has been reduced by 70%. On Barbados, engineers from McGill University, Montreal, were endeavoring to harness the wind, which blows steadily in many of the world's arid areas, to provide some of the energy needed to produce fresh water from salt. Sunshine is also being employed in this endeavor.

Droughts still plague areas which are not deserts, but which in good years can produce valuable crops. Recent examples are the dry "shoulder" of Brazil, where 90% of the crops were lost and 20 million persons were affected. Crop losses in China as a result of widespread drought have been on an even larger scale. (See also SANITARY ENGINEERING.)

Construction Projects.—Among the most striking man-made projects is the world's longest vehicular tunnel, being bored under 15,781-foot-high Mont Blanc between France and Italy. The tunnel, which is scheduled to be opened to traffic in 1964, is 7.5 miles long. French and Italian engineers, boring from opposite sides, broke through the last rock barrier on Aug. 14, 1962. A second road tunnel, 3.6 miles long, will link Italy and Switzerland under the Great St. Bernard Pass (8,113 feet) about 15 miles east of Mont Blanc. The work was started in 1959 and the route was expected to be open to traffic in the fall of 1963. A third European road tunnel was being constructed under the Pyrenees. A little less than two miles long, it will link France and Spain.

Discussion continued about the proposed Channel tunnel between England and France. If it is built, it will be at least 21 miles long. Two alternatives have been proposed. One is a bridge that would carry both road and rail traffic; it would include 130 spans and take six years to complete. The other is a dam, which would not only provide traffic routes on the top and locks to allow the passage of ships, but would also produce electricity. Other European road plans include a super-

highway through the Brenner Pass between Austria and Italy. (See also TUNNELS.)

Oceanographic Research.—The international Indian Ocean Expedition began work on a wide range of projects in July 1962. The 20 participating vessels from 12 nations include the *Vityaz* and *Ob* from the Soviet Union, and the *Vema* and *Atlantis* from the United States. The projects under study include several likely to prove of great economic importance, such as study of the suspected untapped reserves of fish in the Arabian Sea.

A comprehensive study of the oceanography of the Atlantic continental shelf was planned as a result of a conference on Shallow Water Oceanography, held in March 1962. The 120 papers read at the six days of sessions included geology, biology, chemistry, physics, and meteorology. New oceanographic research vessels are being built for use on both the Atlantic and Pacific coasts of the United States. The Scripps Institute of Oceanography's research craft, completely equipped for both tropical and arctic work, is expected to be ready by 1965. The 210-foot *Atlantis II*, which will include an underwater observation chamber, is being constructed by the Woods Hole Oceanography Institution.

Commander Jacques-Ives Cousteau, whose oceanographic research is based on Monaco in the Mediterranean, constructed a deep-water shelter in which two observers lived for 24 hours. They were watched through closed-circuit television from aboard the research vessel *Calypso*. This experiment proved the feasibility of extended study of the sea bottom. (See also OCEANOGRAPHY.)

Oil Production.—Soviet production of oil is going through important changes. Long absent from the world oil market, the USSR is now an important source of fuel throughout eastern Europe, and is expected to reach Western markets. A major result of the Comecon organization (the Council for Mutual Economic Assistance, set up in 1949 to integrate the economies of the USSR and its satellites) has been the completion of a pipeline from Brody in the western Ukraine over the Carpathian Mountains to Bratislava, Czechoslovakia. Other major links in the growing pipeline network are to Ventspils, Latvia; Schwedt, East Germany; and Swony, Hungary. Eventually the pipeline will reach the Soviet Union's Pacific coast. In 1961 the USSR, which produced 3.3 million barrels of oil a day, became the world's second producer, replacing Venezuela. (See also PETROLEUM.)

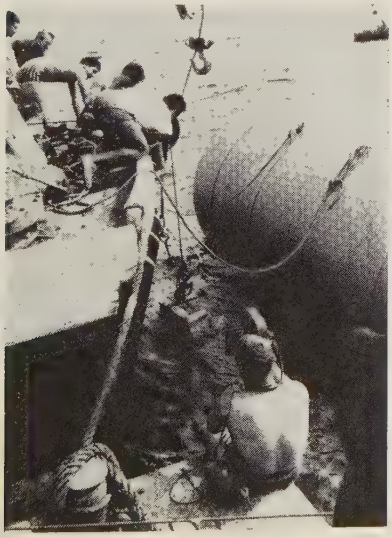
Mountain Climbing.—Mountaineering in 1962 continued to attract climbers in all parts of the world. Sir John Hunt led 12 British and five Soviet climbers in a major assault on the Pamir Range in Soviet central Asia. Among the peaks climbed was the 24,590-foot-high Mount Communism. Two Swiss guides were successful in climbing the north face of the Matterhorn (14,701 feet) in winter (Feb. 4, 1962). This had been described as "the only great feat left for mountaineers in the Alps."

An Indian attempt to climb Mount Everest in June 1962 failed. Other major climbing expeditions in the Himalaya Mountains in 1962 were on Mount Jannu (25,294 feet) by a French team; Pumori (22,342 feet) by a German team; Kanjiroba Himal (22,000 feet) by a British women's team; Jugal Himal (23,240 feet) by a Japanese team; and Kokthang (23,000 feet) by an Indian Army team. A second Japanese team, from Hokkaido University, climbed 24,012-foot-high Mount Chamlang. A team of American climbers on June 29, 1962, reached Mount McKinley, Alaska (20,320 feet) from the southeast spur for the first time.

Earth Research and Seismology.—An international study of the upper mantle of the earth's crust began in 1962. The most dramatic experiment is the Mohole Project, an attempt to drill about six miles down through the crust to the Mohorovičić discontinuity; the crust is believed to be thinnest under the oceans. In 1961 a successful test was made near Guadalupe Island, west of the coast of central Lower California, Mexico, in 11,700 feet of water. A hole 601 feet deep was bored into the ocean floor (an earlier attempt in 3,000 feet of water off La Jolla, Calif., had penetrated 1,035 feet). The final attempt is to be made in three miles of water and through three miles of crust. It may then be possible to determine the density of the core, whether the earth is cooling, and why there is a high rate of heat flow through the ocean floors.

Soviet scientists plan a series of underwater drilling projects in the Aral Sea and in a lake north of the Caspian Sea. They hope to sink a hole more than four miles deep, piercing what is said to be the thickest sequence of sedimentary rock on earth.

Canada has announced a nationwide program as part of the SCUM (Scientific Committee of the Upper Mantle) project. Seismological stations are being constructed at 500-mile intervals throughout the country. At each station a hole 1,000 feet deep



First efforts toward living under water were made in 1962. (*Left*) The *Diogene*, designed by Jacques-Yves Cousteau, is lowered into the Mediterranean off Marseille on September 10. (*Right*) Claude Wesly and Albert Falco are shown inside the craft, in which they remained 24 hours.

AFP FROM PICTORIAL PARADE

is to be drilled so that accurate readings of heat flow can be taken. This may well prove to be an economical technique for studying the composition and structure of the upper mantle. There may also be evidence concerning possible movement of continents and the forces which build mountain ranges. Recording the occurrence of nuclear explosions is an additional reason for the present widespread interest in seismology. There remains some uncertainty as to whether such explosions can always be distinguished from natural shocks due to earth movements.

Artificial earth satellites with a wide range of instrumentation are providing geographers with additional scientific tools. Transit satellites are being employed for geodetic triangulation and for astronavigation; fixes can be obtained from them with an error of 30 feet or less. (See also SEISMOLOGY.)

Weather Research.—Tiros satellites, originally intended to assist weather forecasters by photographing cloud formations from above, are proving to have other uses. Winter navigation is aided by mapping the distribution of ice in seas and lakes from photographs taken by Tiros satellites. Photographs may also make it possible to study continent-wide distributions of vegetation, as well as surface morphology.

Tiros V, launched on June 19, 1962, has as a primary aim the forecasting of Atlantic hurricanes. Circling at an altitude of 400 miles, it can scan the surface of the earth to 65° north and south of the equator. It should, therefore, also be effective for studying ice distribution in navigable waters of the Arctic and Antarctic regions.

International cooperation in the scientific use of satellites is growing. The World Meteorological Organization has under discussion a World Weather Watch proposed by the USSR and the United States. This will make use of satellites and other devices, and will be particularly useful in parts of the world that do not have complete weather-observing systems. (See also METEOROLOGY AND CLIMATOLOGY; SPACE FLIGHT.)

Polar Exploration.—The Arctic and Antarctic regions continued to receive intensive attention from scientists in 1962. The Arctic Institute of North America and the American Geographical Society opened a research base at an altitude of 8,500 feet in the St. Elias Mountains of Alaska and the Yukon. Using the best modern equipment for travel—light planes and small over-snow vehicles—the base is used for glaciological research and the study of the human response to cold conditions.

The U.S. Army Cold Regions Research and Engineering Laboratory at Hanover, N.H., in 1962 continued its project to drill through the Greenland icecap in an attempt to reach bedrock beneath. The site of the test is at Camp Century, where power is provided by a nuclear reactor.

A Canadian expedition using a dry oil well at Winter Harbour on Melville Island found that the ground is permanently frozen to a depth of almost 1,500 feet. Tests are continuing to determine the rate of flow of heat through the earth's crust at this point.

The earth's north magnetic pole continues to migrate. In 1952 it was at the northwest edge of Prince of Wales Island in the Canadian Arctic. By 1962 it was at the southern coast of Bathurst Island, at latitude 75°N. and longitude 99°30′W., as determined by a Canadian expedition. The south magnetic pole has moved 300 miles in the past 50 years.

The world's first atomic-powered icebreaker, the Soviet *Lenin*, continued to be used along the Northern Sea Route as an aid to cargo vessels. It also carried personnel and supplies for the Soviet research station North Pole 10, and for scattered automatic weather stations. In 1961 it covered 20,000 miles in service and reached latitude 81°N. (See also ANTARCTICA.)

TREVOR LLOYD,
Professor and Chairman, Department of Geography, McGill University.

GEOLOGICAL SURVEY. See GEOLOGY.

GEOLOGY

The year 1962 was marked by a continuing trend toward wider use of geology in new areas and new applications. The major emphasis was still on studies in economic and regional geology, but more and more effort and many of the more noteworthy results were in fringe areas, as geology in alliance with other scientific disciplines investigated the world in which we live. A symposium on *Frontiers in Geology*, commemorating the 50th anniversary of Rice Institute, included papers on statistical inferences in geology, on biological problems relating to the composition and diagenesis of sediments, and on avenues from astronomy to geology, as well as fundamental and experimental aspects of studies of the crust and interior of the earth.

Geology has traditionally been a qualitative science, though making use of numerical data. As more data have accumulated, especially through geophysics and geochemistry, the use of high-speed computers, automatic data acquisition, and automatic data processing are being actively investigated to such a degree that the American Association of Petroleum Geologists was able to present a symposium entitled *Geology Enters the Computer Age* at its 1962 meeting. In another symposium at the University of Michigan, the needs and potential for remote sensing as applied to earth-science problems were considered.

Mapping.—In the austral summer of 1961–62 the United States launched the greatest season of scientific research in the Antarctic with participation by nearly 200 scientists, including geologists from the U.S. Geological Survey and eight universities. Aerial geologic mapping at a scale of 1:50,000 was completed in the Thiel Mountains, and reconnaissance maps of other areas were made, as well as extensive glaciological investigations.

The earthward face of the moon is being mapped photogeologically at a scale of 1:1,000,000, and the first geologic quadrangle map of the Kepler-crater region of the moon has been published by the U.S. Geological Survey. The first map covers part of the nominal target area for the Ranger spacecraft. Stratigraphic studies of the moon are continuing, and it has been found possible to discriminate major units by analysis of statistical parameters by high-speed digital computers.

U.S. Geological Survey scientists took part in several multidisciplinary cruises in the northern Pacific which were the first operations in a long-range program to make systematic observations and eventually detailed scientific maps of the entire world ocean.

Research.—The United States is carrying on a number of investigations of the earth's upper mantle applicable to the 20-nation Upper Mantle Project being coordinated by the International Union of Geodesy and Geophysics for a three-year period (1962–65). American activities include Project Vela Uniform, devoted to seismic research; and Project Mohole, in which scientists hope to drill through the ocean bottom where the earth's crust is thin to the Mohorovičić Discontinuity (Moho). After test boring in 1961 to a depth of 601 feet below the ocean floor, Project Mohole has entered a second phase with the National Science Foundation (q.v.) assuming overall responsibility. As investigations of the cores obtained in the first phase of drilling continue, plans are under way for the second, intermediate, drilling stage.

The USSR has planned to drill at least five deep holes in various regions of the Soviet Union. One of these holes may be sunk in the Sakhalin-South Kurile island region where land drilling down to the Moho may be feasible through what is believed to be a thin crust.

On Dec. 10, 1961, as an operation of Project Gnome, a 5-kiloton nuclear device was detonated in the Salado formation in the Delaware Basin about 23 miles southeast of Carlsbad, N.Mex. Seismic waves from the shock were recorded by 43 volunteer crews representing 36 organizations, in an outstanding example of cooperation. These

records are providing information on the crustal structure of the southwestern United States. U.S. Geological Survey scientists reported that veins of man-made breccia were found as much as 100 feet from the shot point. The vein material included the minerals laurionite and galena formed by lead of the shielding block in combination with chlorine and sulfur, respectively, as well as twisted wire, rail, charred wood, and salt fragments.

Subsidence over the sites of several recent underground nuclear tests formed nearly circular depressions in the level floor of Yucca Flats at the Nevada test site. This offers the possibility of creating depressions for harbors or consolidating ground much closer to populated regions without causing radioactive fallout.

A second high-pressure polymorph of silica, called stishovite, has been found occurring with coesite in shocked sandstone at Meteor Crater near Flagstaff, Ariz. The mineral was first synthesized in 1961 by Soviet scientists S. N. Stishov and S. V. Popova, at a pressure of 110 to 120 kilobars and a temperature of 1200 to 1400°C., corresponding to a depth of 400 km. in the earth. Its presence at Meteor Crater is attributed to transient shock pressures accompanying meteoritic impact.

As population increases, areas become urbanized and industrialized, and radioactive materials are more widely used, new problems in public health and safety have been created. Among those being actively investigated are radioactive waste disposal and the distribution of elements related to health. Geologic information on sedimentary basins is being compiled, physical properties of rocks and minerals are being studied, and the transport and concentration of solutions are being investigated. A nationwide program of aeroradioactivity mapping has been carried on for several years by the U.S. Geological Survey on behalf of the U.S. Atomic Energy Commission. In other investigations of the relation between distribution of certain elements and health, the presence of lead in subtoxic amounts has been noted in vegetation growing near major highways, and the absorption of vanadium in plants, important in human nutrition, has been found to vary widely. Maps are being compiled of the distribution of other elements for use of health agencies.

The oldest rocks yet known in the Western Hemisphere were found in Minnesota, where the age of the Morton gneiss has been found to be 2.8 billion years.

Temperature measurements in what is believed to be the northernmost oil exploration hole in the world indicate that subfreezing temperatures currently extend to a depth of about 1,500 feet, the greatest measured depth of permafrost in North America.

Study of aeromagnetic data obtained over the Arctic region by the U.S. Geological Survey and the U.S. Coast and Geodetic Survey shows most of the high-amplitude anomalies in a single large area west of longitude 90°W. Anomalies are small over the Lomonosov Ridge, the dominant topographic feature. No magnetic indication of the midoceanic ridge was inferred from earthquake data.

WIDE WORLD

Columns of smoke billow from Mt. Oyama on the Japanese island of Miyakejima during volcano eruption in mid-August.

Economic Geology.—In the field of economic geology, visions of a new mining boom in Alaska were sparked by the announcement of a second discovery of beryllium ore in the Lost River tin area on the western Seward Peninsula. Discovery was attributed in part to use of a beryllium-detecting device.

A new geologic map of the State of Vermont at a scale of 1:250,000, and one of Missouri at a scale of 1:500,000 were published. The University of Texas Bureau of Economic Geology announced plans for a geologic atlas of the state. The project calls for compilation of 37 maps at a scale of 1:250,000. Several geologic quadrangle maps at a scale of 1:24,000 have been published as the result of the joint U.S. Geological Survey–Kentucky Geological Survey project to map the entire state. The U.S. Geological Survey published a new tectonic map of the United States exclusive of Alaska and Hawaii. Compilation of a tectonic map of North America is well under way. The U.S. Geological Survey has also issued a series of mineral resource maps of the United States (exclusive of Alaska and Hawaii) showing locations of important deposits of various metallic and nonmetallic materials.

Education.—In a venture into a new field, a film of the 1959–60 eruption of Kilauea Iki on the island of Hawaii, produced by the U.S. Geological Survey and the U.S. National Park Service, won several prizes, including a blue ribbon at the American Film Festival and a first prize at the 13th International Exhibition of Cinematographic Art at Venice.

Outlook for the future remains somewhat problematical. Statistics compiled by the American Geological Institute indicate that the profession is made up mostly of younger men. Yet fewer students are being attracted to geology, and at the present time the number of students studying for master's and doctor's degrees is greater than those studying for bachelor's degrees.

Griffin	21,735		

Government.—Chief executive and judicial officers in 1962 included S. Ernest Vandiver (Democrat), governor, serving a four-year term; Garland T. Byrd, lieutenant governor; Ben W. Fortson, Jr., secretary of state; Jack B. Ray, treasurer; B. E. Thrasher, Jr., auditor; Eugene Cook, attorney general; Claude L. Purcell, superintendent of public instruction; and William H. Duckworth, chief justice of the 7-member Supreme Court.

The Georgia General Assembly, which convenes annually, comprised 52 Democrats, 1 Republican, and 1 Independent in the Senate in 1962 and 201 Democrats and 2 Republicans in the House of Representatives.

Legislation, 1962.—Following the U.S. Supreme Court decision of March 26 concerning the apportionment of voting strength in rural and urban areas, a three-judge federal District Court ruled that Georgia could not use the county-unit system in its September 12 primary. Under the Neill Act of 1916, the 8 largest counties in the state had six unit votes each, the 30 counties next in size had four unit votes each, and the remaining 121 counties had two unit votes each—a total of 410 county-unit votes.

This system enabled a candidate who received a mere plurality of the popular vote in a county to receive all of its unit votes; the candidate who received a majority of the unit votes won the election. Critics of the system charged that 99 votes in Georgia's most populous county equaled 1 vote in its least populous county, and that 15.4% of the state's population could nominate—and thus elect—a candidate in a two-man contest.

On April 27 the General Assembly, in extraordinary session, raised the number of county-unit votes from 410 to 547, with the number of votes ranging from 40 for the largest county (Fulton) to 2 votes each for the 97 smallest counties. However, the next day the same federal court ruled that the system was still unconstitutional. As a result, the Democratic primary on September 12 was held on a popular basis for the first time in more than 50 years.

Georgia's election procedures suffered a second reversal on May 25. This time a federal court panel held that urban residents must be assured of equal representation in at least one house of the General Assembly by January 1963 or it would take steps to force the action. In compliance with the ruling, a second special session of the legislature was convened on September 27. It agreed to maintain the Senate at 54 seats but to revise the senatorial districts on a population basis, each district having approximately 75,000 residents.

Under this reapportionment plan there is a wide variation in representation among the various counties, ranging all the way from one county (Fulton) with seven senatorial districts to one district (the 50th) with eight counties. The measure, signed into law by Governor Vandiver on October 5, gives the state's nine most populous counties control over 23 of the 54 Senate seats, compared with the maximum number of 9 which they had held previously.

Measures passed by the regular session of the Assembly earlier in the year included passage of the first home-rule bill to clear the legislature (after nine years of effort). Other successful bills prohibited picketing or demonstrating around state property without a permit; prohibited strikes by state employees; established new procedures which require the state to pay tuition grants to children who do not desire to attend public schools, and give the state Board of Education the right to set up standards for private schools; and provided for two constitutional amendments creating a state budget bureau and requiring the legislature to allocate state funds. (Both amendments were approved in the November voting.)

Finance.—In the 1961 fiscal year, revenue of $399,751,307 included $395,256,538 from state taxes and $4,494,668 in federal funds. Chief tax yields were the 3% general sales tax ($148,064,178) and taxes on motor fuels ($86,095,131), individual income ($51,784,337), and corporate income ($25,170,759). Spending of $397,142,493 included $203,782,563 for education, $59,469,322 for health, welfare, and safety, and $94,850,160 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 21,662 teachers enrolled 683,432 pupils; secondary schools with 12,666 teachers enrolled 312,116; and parochial schools with 554 teachers enrolled 17,040. Enrollment in the state's colleges and universities totaled 51,955.

Public school spending in the 1961–62 school year comprised current expenditures of $227,948,578 ($261.48 per pupil) and capital outlay of $27,318,704. Revenue was drawn chiefly from state funds ($156,550,747) and local districts ($69,944,266). Teachers' salaries averaged $4,397.01 (high school, $4,455.85; elementary, $4,362.20). Actual spending for higher education (fiscal 1961) totaled $53,208,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 168,523 persons totaled $87,295,863. This amount included $53,324,924 for the aged and $17,237,222 for dependent children.

Transportation and Communications.—With 1,697 miles of highway construction and reconstruction completed in 1961, *highways and roads* on July 1, 1962, totaled 96,736 miles (34,731 surfaced). These served 1,635,453 *motor vehicles* (as registered on July 31, 1962), including 1,233,230 automobiles. Operating in the state were (Dec. 31, 1961) 28 *railroads* (using 4,008 main line miles of track); (1962) 9 regularly scheduled *airlines;* and 81 commercial and municipal *airports.*

Communications media included (1962) 111 AM and 14 FM *radio stations;* 13 VHF and 2 UHF *television stations;* 28 daily *newspapers* (circulation, 872,770) and 207 other newspapers; and (January 1) 368,400 business and 941,700 residential *telephones.*

Labor Force.—The state's labor force in June 1962 included 124,300 agricultural workers. Nonagricultural employment totaled 1,301,900, compared with 1,251,700 a year earlier and an average of 1,254,500 for the calendar year 1961. Of nonfarm employees, 26.5% were in manufacturing, 17.5% in trade, and 15.7% in government services. Unemployment in June 1962 had dropped to 79,100 from the 110,500 reported a year earlier.

Manufacturing.—Manufacturing engaged 320,036 workers in 1960, including 264,456 in production, and provided a payroll of $1,205,970,000. Adjusted value added by manufacture totaled $2,481,661,000.

LEADING GEORGIA MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1] (in thousands)
Textile mill products	96,479	$315,076	$552,701
Food and kindred products	42,145	154,163	381,648
Transportation equipment	23,907	149,083	296,457
Paper and allied products	18,088	93,695	269,762
Apparel and related products	38,802	104,798	180,092
Chemicals and allied products	10,238	47,970	153,025

Stone, clay, glass products	10,862	40,099	91,403
Fabricated metals	9,547	38,380	76,539

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—Georgia ranked 29th among the states in the value of its mineral output in 1961, with 0.53% of the national total. It was first in output of dimension granite, and second in bauxite, dimension marble, and scrap mica.

GEORGIA MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Barite	106,914	$ 2,046,000
Clays	3,569,000	42,025,000
Coal	4,000	22,000
Feldspar (long tons)	31,128	692,000
Iron ore, usable (long tons)	162,000	835,000
Sand and gravel	3,150,000	3,049,000
Stone	15,854,000	38,077,000
Talc and soapstone	47,950	98,000
Other minerals	...	9,457,000
Total	...	$95,256,000[1]

[1] Total adjusted to eliminate duplication in value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government pay-

ments) totaled $565,031,000, compared with $540,195,000 for the corresponding period of 1961. For the full year 1961, income comprised $412,880,000 from livestock, $357,683,000 from crops, and $26,926,000 in government payments. Principal income sources in 1961 were broilers, $156,272,000; cotton lint, $85,956,000; eggs, $85,936,000; and tobacco, $84,066,000.

The state's 106,000 farms in 1959 had an acreage of 19,658,000 (4,918,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,481,000 cattle, 1,519,000 hogs, and 15,336,000 chickens, and (1961) 1,056,825,000 commercial broilers. An average of 127,000 family and 48,000 hired workers were engaged in farming during 1961.

GEORGIA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Corn for grain (1,000 bu.)	48,925	65,800	50,760
Cotton lint (1,000 bales)	608	512	535
Cottonseed (1,000 tons)	250	213	222
Oats (1,000 bu.)	10,888	7,568	5,560
Peaches (1,000 bu.)	3,088	5,200	4,200
Peanuts (1,000 lb.)	501,515	574,750	545,200
Pecans (1,000 lb.)	38,280	78,600	15,000
Soybeans (1,000 bu.)	742	1,360	1,280
Tobacco (1,000 lb.)	120,869	137,949	147,574
Wheat (1,000 bu.)	2,169	2,538	1,175

(Source: U.S. Department of Agriculture.)

Events, 1962.—Carl E. Sanders, a 37-year-old Augusta lawyer, scored a surprisingly easy victory over former Gov. S. Marvin Griffin in the Democratic primary on September 12. Sanders, a moderate on racial issues, keyed his campaign to charges of corruption in the Griffin administration, while his opponent, an ardent segregationist, denounced Sanders as a "tool" of Negro interests.

Sanders won the governorship in November without opposition. The Republicans had entered the race for the first time since Reconstruction days, but their candidate, A. Edward Smith of Columbus, was killed in an automobile accident on June 5.

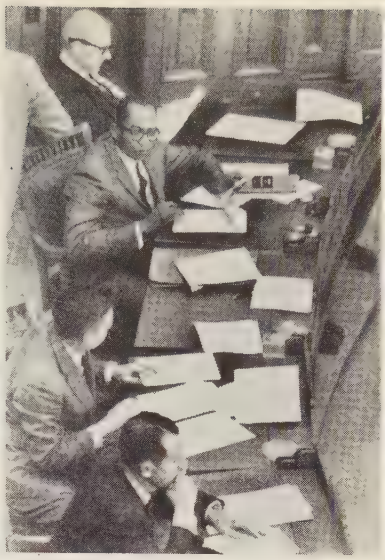
Other officials nominated or renominated in the Democratic primary (tantamount to election) included U.S. Sen. Herman E. Talmadge; Peter Zach Geer for lieutenant governor (after a runoff); and James L. Bently, Jr., for comptroller general. The primary was notable in that it was based on a popular vote (see above, *Legislation, 1962*).

A three-judge federal court on June 30 refused to order the State of Georgia to redistrict its 10 congressional seats, holding that this is a responsibility of Congress and the state legislature.

On June 3 an Air France jetliner crashed in Paris, killing 130 persons in the worst single-plane disaster in aviation history. Of the 121 Americans aboard, 115 were from Georgia, including 106 residents of metropolitan Atlanta. Most of those from Georgia were members of the Atlanta Art Association, who were completing a tour of art galleries and museums of Europe. A large arts center is to be built in Atlanta as a memorial to the dead.

In June the federal government ordered the Veterans Administration to end racial discrimination in hiring undertakers for deceased veterans. The decree affected four VA hospitals in Georgia. White families of the state, except for the most indigent, have chosen to make their own funeral arrangements, and decline the federal aid which amounts to approximately $250 for each funeral.

Archbishop Paul J. Hallihan ordered all Catholic schools in the 71-county Archdiocese of North Georgia completely integrated as of September regardless of race or color. Three high schools and 18 parochial elementary schools were affected by the edict.



UPI

Georgia's first Negro state senator since Reconstruction days, Leroy Johnson (facing camera), won seat in the November 6 election.

The city of Albany attracted national and even international attention for several months as local authorities firmly resisted a campaign by Negroes to win desegregation of some lunch counters, the city library, and other public facilities. The movement was directed by the Rev. Dr. Martin Luther King, Jr., who was twice jailed by local authorities, as were (on August 28) 70 religious leaders from the North and Midwest, following an antisegregation prayer vigil. Mass demonstrations and arrests were commonplace during the summer, which was also marked by considerable legal activity. Efforts by Negroes to register to vote and to integrate the city schools were unsuccessful, and by the end of the year the direct-action campaign had failed to achieve its goals.

Several Negro churches in south Georgia which had been used in connection with Negro voter registration were burned during the summer and fall. The arson was deplored by officials in Washington as well as by many citizens of the state.

GERIATRICS. See OLD AGE.

GERMAN LITERATURE

Drama.—Attendance at the many West German theaters was not reduced by the rapid spread of television during the last season. German prewar and classic plays and modern foreign dramas predominated. Robert Thomas' *Trap for a Lone Man* led the list with 520 presentations. Lessing (*Nathan der Weise*), Ionesco (*Le rhinocéros*), Hauptmann (*Der Biberpelz*), Shakespeare (*As You Like It*), Kleist (*Der zerbrochene Krug*), Conners (*Patsy*), Sartre (*Les sequestrés d'Altona*), Levitt (*The Andersonville Trial*), Anouilh (*Becket*), and Pinter (*The Caretaker*) were much in evidence. Lawrence Durrell's new play, *Actis*, had its world première under Gustav Gründgens' direction in the Hamburg Schauspielhaus.

Noteworthy new plays and comedies were, among others, Hans Baumann's *Im Zeichen der Fische*, Mattias Braun's *Unkenpfuhl*, Joseph Breitbach's *Die Jubilarin* (after a successful première in Paris, the German playwright's home), Wolfgang Hildesheimer's *Die Verspätung* and *Rivalen* (an adaptation of Sheridan's *The Rivals*), Richard Hey's *Weh dem, der nicht lügt*, Nelly Sachs' *Eli*, Martin Walser's *Der Abstecher*, and the posthumous play by Hans Rehfisch (1891–1960), *Verrat*

in Rom, which deals with the problems of the atomic scientist.

Austria contributed Otto Zoff's *Die Geschwister Erskine,* and Alexander Lernet-Holenia's *Alkestis;* Switzerland, David Wechsler's *Weg zu Rahel.*

Poetry.—Rudolf Alexander Schröder (b. 1878), the poet and translator many of whose songs have been incorporated in Protestant hymnbooks, died on Aug. 22, 1962. One of the leading German poets, Rudolf Hagelstange, published *Die schwindende Spur* and *Lied der Jahre, 1931–1961.* (See also under *Translations,* below.) Marie Luise Kaschnitz (Weinberg), Karl Christian Müller, Johannes Poethen, Nelly Sachs, and Georg von der Vring, among other West German poets, submitted collections of their poems.

Austria was represented with volumes of poetry by Arthur Fischer-Colbrie (*Gleichenberger Elegien*), Joseph Marschall (*Flöten im Lärm*), and Conny Hannes Meyer (*Den Mund von Schlehen bitter*).

Novels and Short Stories.—The grand old man of modern German literature, Nobel Prize winner Hermann Hesse (b. 1877), died on Aug. 9, 1962.[1] Ernst Augustin (b. 1927) received the Hermann Hesse Prize for his successful novel *Der Kopf.* Another rising star on the German literary horizon is 27-year-old Uwe Johnson, who received the International Publishers' Prize for his writings, but especially for *Das dritte Buch über Achim,* his latest success. Arthur Koestler's *Von Heiligen und Automaten* was selected as the book of the month for April 1962 by the Darmstadt jury.

Statistics for 1961 show that West Germany has become one of the world's four greatest book producers, with 23,132 published titles, an increase by 6,600 items over 1959.

The Austrian Erwin Guido Kolbenheyer (b. 1878) died in 1962. Rudolf Bayr, Robert Braun, Max Brod (*Die Rosenkoralle,* "ein Prager Roman"), Jeannie Ebner, Ivo Hirschler, Othmar Franz Lang, Ilse Meidinger-Geise (*Der Mond von Gestern*), and Friedrich Schreyvogel contributed novels; Gertrud Fusseneger, a collection of short stories. Franz Kafka's collected stories, including previously unpublished works and drafts from his literary legacy, were presented in one volume.

Nonfiction.—Ludwig Marcuse, who lives in California, published his autobiography, *Mein zwanzigstes Jahrhundert;* Erich Kästner, a diary (Feb. 7—Aug. 2, 1945), in *Notabene 45;* Rolf Schroers, *Der Partisan,* a contribution to political anthropology; Max Tau, *Das Land, das ich verlassen musste.* Kasimir Edschmid collected his essays in *Portraits und Denksteine.* The literary historian Wolfgang Kayser published *Geschichte des deutschen Verses.* The poet Hans Egon Holthusen collected his literary essays in *Kritisches Verstehen.* Theodor Heuss, in *Vor der Bücherwand,* presented sketches of poets and poetry. Alfred Kantorowicz, who fled from the Eastern zone in 1959, published the second volume of his *Deutsches Tagebuch.* A *Festschrift, Nelly Sachs zu Ehren,* was published on the poetess' 70th birthday when she also received the first 10,000-mark Nelly Sachs Prize, given by the city of Dortmund. *Stefan Zweig,* a documentary account of his life, was published by his first wife Friderike. The Austrian Inge Meidinger-Geise published *Margarete Windhorst und Westfalen.*

Translations and Works in English.—*Billiards at Half-Past Nine* by Heinrich Böll (McGraw-Hill) conjures up German history through three generations. Other translations of novels were Friedrich Dürrenmatt's *The Quarry* (New York Graphic Society), Alice Ekert-Rotholz' *Marie Bonnard* (Viking), Christian Geissler's *The Sins of the Fathers* (Random House), Willi Heinrich's *The Lonely Conquerer* (Dial), and Hans Keilson's *The Death of the Adversary* (Orion). The University of North Carolina Press published the medieval minstrel epic *King Rother* and Rudolf Hagelstange's *Ballad of the Buried Life;* Pantheon in 1961 presented *Poems and Verse Plays* by the Austrian Hugo von Hofmannsthal. Among the anthologies were *German Poetry* (Appleton-Century-Crofts), *Modern German Poetry: 1910–1960* (Grove), and *Twenty German Poets* (Random House).

Translations of nonfiction included *The Letters of Beethoven* (St. Martin's Press 1961), *Last Letters from Stalingrad* (Morrow), Karl Jaspers' *Great Philosophers* (Harcourt, Brace & World), and Herbert Wendt's *It Began in Babel* (Houghton Mifflin). Barbara W. Tuchman published *The Guns of August* (Macmillan) on World War I; and Alson J. Smith, *A View of the Spree* (John Day) on Kaiser Wilhelm and the American Mary Esther Lee.

Professor of Germanic Languages and Literatures, University of North Carolina.

[1] See biographical sketch in the Necrology at the end of this volume.

GERMANY

The Federal Republic of Germany (West Germany) and the German Democratic Republic (East Germany) were established as separate states in 1949, following the failure of inter-Allied cooperation after World War II. The city of Berlin, established as an inter-Allied zone according to an agreement between the occupying powers on May 1, 1945, was equally divided in 1948, though the Western powers and the Soviet Union have retained in both sections certain rights based on the original agreement. The capital of West Germany is Bonn; East Germany has its capital at East Berlin.

Through the Berlin Declaration of June 8, 1945 (reaffirmed by the Potsdam Agreement of Aug. 2, 1945) the four victorious powers established an Allied military government over Germany that was to be exercised by an Allied Control Council composed of the four commanders-in-chief. Its rule was to extend over all of the German territories of 1937 except the lands east of the Oder and Neisse rivers, which were placed under Polish rule, or in the case of northern East Prussia, Soviet administration. For reasons of military occupation, Germany was divided into American, British, French, and Soviet zones; and Berlin, as the seat of the Allied Control Council, was made an Allied zone, divided again for occupation purposes into four sectors but administered in common by a Kommandatura consisting of the four Allied commanders.

The complete breakdown of East-West cooperation after 1945 was reflected in the different policies of the Western powers and the Soviet Union in Germany. In the absence of a German peace settlement the Western powers merged their zones and created in 1949 the Federal Republic of Germany, while the Russians established in their zone the German Democratic Republic. A similar development took place within Berlin. After the Allied Control Council and the Kommandatura ceased operations, the Russians attempted to dislodge the Western powers from Berlin altogether by closing the roads from West Germany to West Berlin. The Russian blockade of West Berlin, which lasted from June 24, 1948, to May 12, 1949, was successfully broken by the American-British airlift, but the division of the city under two administrations remained.

Area and Population.—That part of Germany occupied by the four powers in 1945, including the Saarland, has a total area of 137,713 square miles, as compared with the country's area of 181,392 square miles in 1937.

AREA AND POPULATION OF GERMANY

Division	Area (sq. mi.)	Population (June 6, 1961, census)
Federal Republic	95,733.0	54,015,000
West Berlin	186.0	2,197,006
Democratic Republic	41,692.0	16,203,600*
East Berlin	155.6	1,082,300*
Total	137,766.6	73,497,906

* Est. 1960.

The population of the Federal Republic contains 9,556,000 German expellees from the territories east of the Oder-Neisse rivers and from eastern and southeastern Europe. In addition, 3,714,000 German immigrants from East

Confrontation and death at the Berlin wall. (*Left*) Taken in late 1961, this picture shows Soviet and American tanks at Friedrichstrasse checkpoint, only 240 yards apart. (*Right*) The body of 18-year-old Peter Fechter, an East Berliner who was shot by Communists at the base of the wall while trying to escape to West on August 17 and left calling for help until he died 50 minutes later, is lifted across the wire fence by East German guards.

UPI

Germany had fled to West Germany by Dec. 31, 1961. Every fourth inhabitant of the Federal Republic is a refugee.

On June 6, 1961, eleven West German cities had more than half a million inhabitants: Hamburg (1,832,400), Munich (1,084,500), Cologne (809,200), Essen (726,600), Düsseldorf (702,600), Frankfurt (683,100), Dortmund (641,500), Stuttgart (637,500), Hanover (573,100), Bremen (562,900), and Duisburg (503,000). Bonn, the capital, had 143,900 inhabitants.

On Dec. 31, 1960, ten cities in the Democratic Republic had more than 100,000 inhabitants: Leipzig (589,600), Dresden (493,600), Karl-Marx Stadt (formerly Chemnitz, 286,300), Halle (277,900), Magdeburg (261,600), Erfurt (186,400), Rostock (158,600), Zwickau (129,100), Potsdam (115,000), and Gera (101,400).

In 1959 there were 26,650,000 Protestants and 25,476,000 Roman Catholics in the Federal Republic. In 1952, 81% of East Germany's population was Protestant, and 11% was Roman Catholic. On July 1, 1961, 21,685 Jews were living in the Federal Republic; an estimated 9,000 Jews were living in the Democratic Republic.

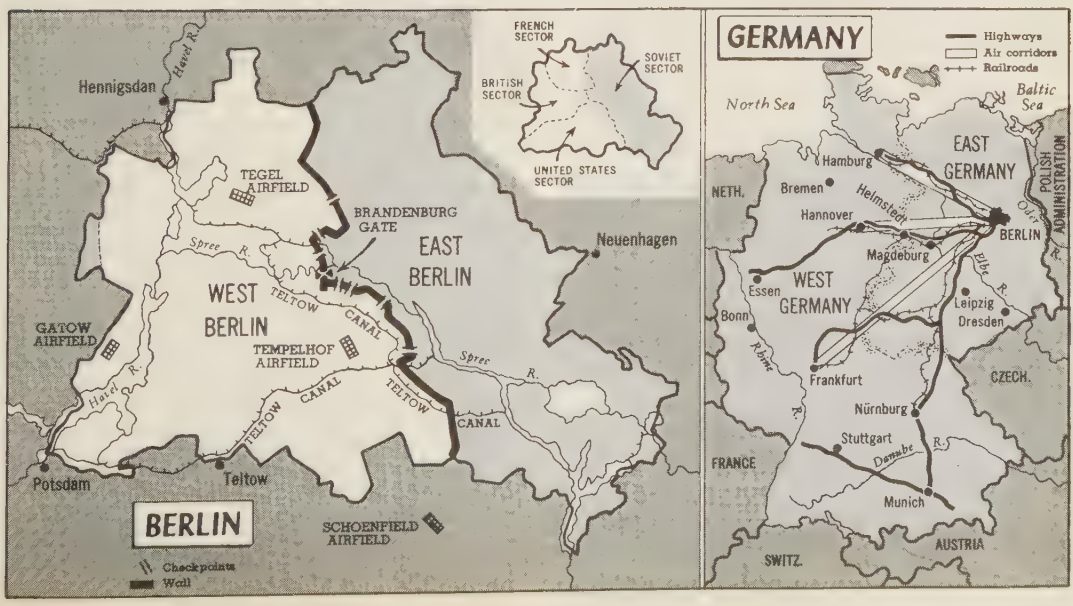
Federal Republic of Germany (West Germany)

Government.—The Federal Republic of Germany, which since May 5, 1955, has exercised full sovereign rights, is a federal state composed of ten *Länder* (states): Baden-Württemberg, Bavaria, Bremen, Hamburg, Hesse, Lower Saxony, North Rhine-Westphalia, Rhineland-Palatinate, Saarland, and Schleswig-Holstein. The constitution of May 23, 1949, divided governmental functions between the federal and *Land* (state) authorities. Public administration is largely in the hands of the state governments, whereas legislative power is divided between the federal and state governments.

The Federal Republic is headed by a president elected for five years by a special assembly of all the members of the federal parliament and an equal number of delegates from the state parliaments. His functions are largely representative, although he nominates the chancellor, who must be confirmed by a majority in the parliament. Heinrich Lübke, a member of the Christian-Democratic Union and federal minister of agriculture from 1953 to 1959, has been federal president since Sept. 15, 1959. Konrad Adenauer (q.v.) has served as chancellor since 1949.

The chief organ of popular representation is the Bundestag or Federal Diet, the national parliament of 521 delegates elected by West German citizens above the age of 21. The states participate in federal legislation through the

AMERICANA MAP BY DONALD T. PITCHER



45-member Bundesrat, in which the individual states, according to their population, have three to five votes each and are represented by members of their government.

West Berlin is closely related to the Federal Republic, and in Germany is called the eleventh *Land*. It is represented in the Bundestag by 22 deputies elected by the Berlin city parliament, and the city government has four representatives in the Bundesrat. The Berlin votes, however, are not counted in votes taken by plenary sessions of the Bundestag and Bundesrat. Federal laws in order to be effective in West Berlin must still be adopted by the West Berlin city parliament, and certain laws, including military conscription, have not been introduced in West Berlin.

Political Developments.—Political life in West Germany during the year 1962 was still dominated by the announced attempt of the Soviet Union to remove the three Western powers from Berlin, and to separate West Berlin from West Germany by turning West Berlin into an internationalized city. In domestic affairs the new West German government, formed in November 1961, was relatively inactive until late in the year, primarily because the parties of the government coalition found agreement difficult. Apart from foreign policy the

PALMER IN THE SPRINGFIELD (MO.) LEADER AND PRESS

"Ill Wind"

struggle of the parties was chiefly concerned with the readjustment of economic policy to the retarded growth of the German economy.

In the elections of Sept. 17, 1961, the Christian Democratic Union (CDU) lost the parliamentary majority which it had enjoyed during the preceding four years, and received only 45.4% of the popular vote. No government could be formed without the Free Democratic Party (FDP), which received 12.8% of the popular vote. Many voters had turned from the CDU to the FDP because they expected that such a coalition would exclude Dr. Adenauer as chancellor. However, the CDU refused to drop Adenauer, the party leader, as the head of the new government. An uneasy compromise was concluded under which Adenauer promised to resign as chancellor far enough before the next election in order to give his successor the opportunity to lead the coalition in the next federal election campaign. Dr. Erich Mende, head of the FDP, asserted that the agreement would require the chancellor's resignation in the fall of 1963, but Adenauer refused to commit himself to any specific date.

The arrest of five editors of *Der Spiegel* on Oct. 26, 1962, began a grave cabinet crisis. *Der Spiegel,* the largest German news magazine, had conducted for many years a campaign against Chancellor Adenauer and Defense Minister Franz Josef Strauss. In early October, *Der Spiegel* published an article on the fall maneuvers of the NATO forces in Germany, and the government charged that the article contained secret information. The German public, however, apparently believed the arrest of the editors was an act of personal revenge by the defense minister, and resented the methods employed by the police. The FDP ministers accused Strauss of having deliberately bypassed them and withdrew from the cabinet on November 19, after Strauss had admitted that he had played a larger role in the police action than he had originally acknowledged.

A new CDU-FDP cabinet was formed on December 11 under Dr. Adenauer, who again refused to announce a definite date for his retirement. But his own party publicly announced on December 7 that it expects him to resign by the fall of 1963. Strauss was replaced as defense minister in the new cabinet by Kai-Uwe von Hassel (CDU), the 49-year-old prime minister of Schleswig-Holstein. Dr. Heinz Starke (FDP) was succeeded as minister of finance by Rolf Dahlgrün (FDP).

The FDP has tried to steer a distinctive course by opposing the trend toward the social welfare state that large groups of the CDU favor. Former Minister of Finance Heinz Starke had successfully opposed salary increases for government officials in 1962, and a further extension of social services in the year 1963. The FDP has also exercised its influence in the direction of establishing some contacts with Germany's eastern neighbors as a prerequisite for German reunification. Like the SPD, the FDP tends to place more emphasis on Anglo-German relations, which it asserts are somewhat neglected by Chancellor Adenauer's interest in Franco-German cooperation. But differences of opinion about the conduct of German foreign policy have been of minor significance. Even the SPD supports almost without reservation the general line of German foreign policy.

There have been no important changes in the popular attitude toward the parties. On July 8, 1962, elections were held for the *Land* parliament of North Rhine-Westphalia, which comprises one third of the population of the Federal Republic. As in the federal elections of September 1961, the CDU lost its majority and had to form a government with the FDP. The only difference between the federal elections of September 1961 and the state elections of July 1962 was a somewhat larger increase in the vote for the SPD, and a somewhat smaller vote for the FDP. The elections for the *Land* parliament in Schleswig-Holstein on September 30 showed the same trend.

Under the influence of the *Der Spiegel* affair, the elections for the *Land* parliament in Hesse on November 11 showed some losses for the CDU and gains for the FDP and SPD. The SPD, for the past 12 years the strongest party in Hesse, gained the majority. In the Bavarian elections of November 25, however, the Christian Social Union (CSU), the Bavarian affiliate of the CDU, gained a larger vote than in the last Bavarian elections and won a majority of seats in the *Land* parliament. The outcome was a great personal victory for Franz Josef Strauss, the popular chairman of the CSU.

Foreign Affairs.—German foreign policy in the year 1962 was chiefly preoccupied with the Soviet threat against Berlin. Although the Federal Republic had agreed to the United States plan to explore means of a Berlin settlement in direct negotiations between Washington and Moscow, the Adenauer government was greatly perturbed that the United States might make concessions regarded as detrimental to West Germany. The principal German fear was that in order to retain unmolested access to West Berlin the Western powers might recognize the German Democratic Republic. Any move that could be construed as a step in this direction was opposed as intolerable by the German ambassador in Washington, Dr. Wilhelm Grewe. His inflexibility and, in the eyes of President Kennedy, unjustified distrust of American intentions induced the president in April 1962 to exclude the ambassador from discussions among the Western powers on the Berlin issue, thereby forcing the Bonn government to announce on May 7 that it would replace its ambassador.

Chancellor Adenauer, on his part, at the same time aroused some apprehension that he would form with President de Gaulle a "Bonn-Paris axis," as opposed to the "Washington-London axis." The idea, however, was largely exaggerated newspaper speculation. The conviction that West Germany can only be defended with the help of the United States is too deeply rooted in West Germany ever to be forgotten by the government. As a matter of fact, the friction that had developed between Washington and Bonn was easily overcome during the summer. Full agreement was reached on common plans for action in the event that the Soviet Union moved to acerbate the Berlin problem, during Foreign Minister Schroeder's visit to Washington on October 14–20, and in the harmonious conversations of President Kennedy and Chancellor Adenauer in Washington on November 14–15.

Among the major problems of German foreign policy was the further advancement of European integration. Owing to the unwillingness of President de Gaulle, the proposed establishment of a close political union was temporarily shelved. New proposals made by France and supported by West Germany for some initial steps in this direction were not approved by the Benelux countries, which have insisted that the question of political union should wait until Great Britain has joined the European Economic Community (Common Market). The Benelux countries and, to a lesser extent, Italy were worried that the European political union might be too strongly dominated by France and West Germany. With regard to the British accession to the Common Market, Chancellor Adenauer was repeatedly accused of dragging his feet. He has stanchly denied any intention of making the entry of Britain into the European Economic Community more difficult, but he has insisted that certain preliminary agreements, particularly those concerning the future of European agriculture, would have to be thoroughly negotiated. (See also EUROPE.)

The reconciliation between France and Germany, unquestionably one of the greatest achievements of Chancellor Adenauer's political career, reached a symbolic climax with his visit to France from July 2 to 8. He was received by President de Gaulle in Paris with the highest honors and, at the end of the visit, the two statesmen reviewed a parade of French and German troops in Mourmelon. President de Gaulle in turn visited Germany from September 4 to 9, touring Bonn, Cologne, Düsseldorf, Duisburg, Hamburg, Munich, and Stuttgart. He was received with extraordinary enthusiasm by the German population.

WIDE WORLD

Chancellor Adenauer of Germany (right) meets President de Gaulle of France at the chancellery in Bonn on September 5 for talks on Europe's future. Interpreter is in center.

Gerhard Schroeder was born in Saarbrücken, Germany, on Sept. 11, 1910. He studied at the universities of Königsberg, Edinburgh, Berlin, and Bonn, and took his doctorate in law in 1933. Until 1939 he taught and practiced law in Berlin and Bonn. He joined the Nazi Party in 1933—for expediency, he explained—but dropped his membership in 1941 after his marriage to a woman of part-Jewish ancestry. A denazification court cleared him of active complicity in the party's crimes after the war. Serving in the German Army in World War II, he resumed his law practice in 1947. He was elected to the first West German Bundestag in 1949, and was reelected in 1953, 1957, and 1961, as a member of the Christian Democratic Union. Appointed minister of the interior in 1953, he became minister of foreign affairs on Nov. 14, 1961, succeeding Heinrich von Brentano.

Federal Budget.—The federal cabinet agreed in September on the federal budget for the calendar year 1963. Federal Minister of Finance Heinz Starke opposed any further extension of social services in order to keep the budget in line with the actual growth of the German economy and thus avoid a further acceleration of the wage-price spiral through large public spending. He was strongly supported by Vice Chancellor Erhard, who won the endorsement of this policy by the majority of the CDU against the will of the less-determined chancellor. The budget for 1963 minimized inflationary dangers by allowing for only such additional expenditure as can safely be ex-

Kai-Uwe von Hassel (l.) replaced Franz Josef Strauss (r.) as defense minister of West Germany on December 11 following general criticism of Strauss for the *Der Spiegel* case; the magazine was accused of publishing military information.

pected to be covered by increased tax revenues provided by the growth of the national product, which is conservatively estimated to expand by 3.5% in 1963.

The estimated budget for 1963 provides for expenditures of DM2,800 million greater than those of the budget of 1962, and is balanced at DM56,800 million (4 Deutsche marks officially equal the U.S. dollar). For military and civil defense the budget provides a sum of DM18,400 million, of which DM17,000 million (2 billion more than in 1962) will be allocated to the armed forces, DM600 million on defense costs in connection with the stationing of Allied troops in Germany, and DM800 million for civil defense. In addition, DM817.5 million was provided for civilian emergency planning; the funds are to be spent in particular for storing provisions of food, fodder, and medicine.

Expenditure for improving roads and transportation facilities totaled DM4,288 million, of which more than half was earmarked for road construction. The sum of DM12,600 million is to be spent on social services. The Federal Ministry for Economic Cooperation is to receive DM936 million, of which DM670 million will be devoted to capital aid (excluding DM800 million available from earlier budgets). The federal contribution to science and research was DM327 million, and another DM332.8 million was provided for research on the peaceful use of nuclear power. Space research received DM109.2 million, more than half of which was for international projects. Another major item in the budget was aid for West Berlin; a sum of DM1,740 million was provided to cover West Berlin's budget deficit, the extension of credits, and grants of various types.

Armed Forces.—The buildup of the West German Army was continued, and on Oct. 1, 1962, the army reached an overall strength of 380,000 men in 9 divisions, comprising 5 armored infantry divisions, 2 tank divisions, 1 airborne division, and 1 mountain division. The army has about 2,000 tanks, 4,000 armored personnel carriers, and 700 self-propelled guns. A tenth division was activated by the end of the year, and two more divisions, formation of which will complete the German rearmament program, are to be organized in 1963.

The German divisions have been placed at the disposal of the North Atlantic Treaty Organization (q.v.) commander, and the German contingent is the largest in number among the NATO forces stationed in the Federal Republic. The German forces, however, are only up to 80–90% of full combat strength, have an insufficient number of junior and noncommissioned officers, and suffer from shortages in certain categories of weapons.

Education.—The aggregate enrollment in West German primary and secondary schools in 1960 was 6,452,704 pupils, which represented a substantial decrease from the 7,295,420 pupils in 1950 because of the smaller birth rate in the postwar period. The teaching force is considered to be inadequate in numbers, and state school-building programs have not produced a sufficient number of classrooms. Enrollment in institutions of higher education was 217,812 students in 1961, or more than double the number in 1950. The planned expansion of German universities has been slow. Proposals have been made to found new institutions of higher learning in Bochum, Dortmund, Bremen, and Regensburg. The largest German university is in Munich (21,406 students in 1961).

Economic Developments.—The year 1962 witnessed a decline in the economic boom that has characterized West German economic developments, particularly in the period 1959–60. National production and income continued to rise in 1962, but on a smaller scale. Real national production rose by 8.8% in 1960, 5.3% in 1961, and an estimated 3.5% in 1962. The index of industrial production (1958 = 100) was 107 in 1959, 119 in 1960, 126 in 1961, and an estimated 130 in 1962. The falling rate of growth is partly explained by the exhaustion of all labor resources.

Employment.—There are few unemployed German workers, and the age groups entering the labor market are smaller in number, due to the low birth rate in the immediate postwar period. There were in the first half of 1962 some 8.4 million employed persons, an increase of 0.8% over the first half of 1961, which by contrast showed a 1.6% increase over the comparable period of 1960. It is assumed that there will be only an additional increase of 0.2% in the number of employed workers in 1963, and only 5% for the period 1960–70. West Germany in 1962 employed 650,000 foreign workers, a number that cannot be increased because the prosperous economies in other European countries has reduced the number of foreign workers available for employment in West Germany. In 1962 there were 600,000 job vacancies in West Germany still unfilled.

Wages and Prices.—The state of the labor market has driven wages and prices up. At the same time, working hours have decreased, averaging 42 hours per week. Since 1959, wages and salaries have risen 30%, whereas the output of the individual worker has increased by only 14%. Wages in the first half year of 1962 totaled DM21,200 million, an increase of 10% over the same period in 1961, which was almost entirely due to wage increases. Between 1959 and 1961 the cost-of-production index, due to the rise in wages and productivity, increased in West Germany from 100 to 111, compared with increases of from 100 to 107 in France and from 100 to 103 in England, and decreases of from 100 to 99 in Italy and from 100 to 97 in the United States. As a consequence, the competitive position of German industries on the world market has been weakened.

The development was reflected in the changing German import-export balance. There was a favorable balance of DM4,500 million in 1960 and DM3,000 million in 1961, but only DM500 million in the first two thirds of 1962, compared with DM2,600 million in the comparable period of 1961. It is understandable that under these conditions some apprehension is felt about the state of the economy, and lively discussions are carried on about a reorientation of German economic policies. The government has made strong appeals to industrialists, merchants, labor unions, and consumers to halt any rise in prices.

Currency and Financial Policies.—The continuous growth of the gold and foreign exchange reserves of the German Federal Bank (Deutsche Bundesbank) that had taken place since 1951 was reversed for the first time in 1961 when holdings fell by DM3,200 million (excluding losses of DM1,400 million incurred as a result of the upward revaluation of the currency in March 1961). In 1962 a deficit of DM3,000 million was expected to occur in the balance of payments. The development was welcomed by international currency experts since the excessive accumulation of reserves froze a substantial part of capital that could have served to finance international trade, and increased in particular the exchange difficulties of the U.S. dollar. On the other hand, reserves of DM25,000 million and outstanding credit claims of DM28,000 million must still be considered ample protection of the German currency. There was a strong international demand for German marks in 1962, and the Deutsche mark was usually quoted at DM3.97 instead of the official rate of DM4.00 to the dollar.

Foreign Aid.—The Federal Republic has taken an active interest in the development of underdeveloped countries. By the end of 1961 it had spent $4,600 million in foreign aid, of which $2,400 million was provided from government funds and $2,200 million from private sources. In 1961 the Federal Republic granted aid amounting to $742 million, of which $457 million was under

bilateral agreements with individual countries and $285 million was for multilateral projects, including the five-year plans of India and Pakistan, and aid to Iran, Turkey, Afghanistan, and Brazil. In 1962 the total aid program amounted to $675 million.

The West German government also maintains a growing technical assistance program, under which grants totaled $70 million in 1961. Almost half of the grants were made to 26 African and Asian countries, and the remainder to 26 countries in Latin America and Europe. About 70% of expenditure for technical assistance was spent on the training of personnel, 10% on planning projects, and 6% on health programs. Plans were made to expand considerably German technical asssistance to Latin America in 1963. For this purpose, Walter Scheel, federal minister for economic cooperation, visited Latin American countries in September 1962. In early October he had discussions with United States officials in Washington and with United Nations development agencies in New York on the coordination of the foreign aid programs of the contributing governments.

Foreign Trade.—Exports amounted to $11,415 million in 1960, $12,687 million in 1961, and $6,453 million in the first half of 1962. Imports totaled $10,103 million in 1960, $10,941 million in 1961, and $6,033 million in the first half of 1962. The figures show a considerable decline in the surplus of exports over imports, but the trade balance remained favorable. West European countries in 1961 provided about 55% of West Germany's imports, and took about 65% of total exports. The United States in the same year supplied 14% of West German imports, and received 7% of total exports.

West Berlin

West Berlin has stood up well under the great difficulties which resulted from the erection of a wall between East and West Berlin by the East German Communist regime on Aug. 13, 1961, and the continued Soviet threat to block communications with West Germany. The wall separated families and friends, and cut off many inhabitants of the city from their working places. West Berliners had felt a certain pride in being "the show window of the West," and many of them had believed their actions might eventually lead not only to the full reunification of Berlin, but also to the reunification of West and East Germany.

The events of Aug. 13, 1961, have made the realization of such hopes appear remote, and the West Berliners have become conscious of their physical isolation behind the iron curtain. But they continue to stand firm, and only few individuals have moved to West Germany. Their trust in the protection afforded by the Western powers has not been shaken, although occasional doubts have been expressed whether the Western powers will use their potential power early enough, or whether, by overlooking small advances of the Soviets, will allow the Russians and East Germans to take West Berlin by so-called "salami tactics" (a steady sequence of small steps, none by itself seemingly important enough to call for strong counteraction).

Particular indignation is constantly engendered by the ruthless shooting of escapees from East Berlin. The shooting by East German border guards on Aug. 17, 1962, of an 18-year-old building worker, Peter Fechter, who was left dying for one hour on the eastern side of the wall, aroused tremendous indignation. An irate crowd of about 400 West Berliners on August 18 threw stones at a bus carrying Soviet soldiers and also uttered scornful jibes at the American soldiers who had to refuse to go to the assistance of the helpless victim. During the next two days the stoning of the Soviet bus bringing the daily honor guard to the Soviet war memorial west of the Brandenburg Gate continued. The Russians then began to use

armored cars instead of a bus, and later were accompanied by jeeps carrying Allied soldiers. The good relations between the West Berlin population and the Allied troops were not affected by the incident of August 17, however.

The protests of the three Western commandants in Berlin to the Soviet commandant over the killing of Peter Fechter was not accepted. Moreover, on August 22, the Soviet government announced that it had abolished the post of Soviet commandant in Berlin and that the police power in East Berlin belonged to the East German government. On the following day the East German government announced the appointment of Maj. Gen. Helmut Poppe, a 36-year-old Communist, as city commandant. The Western powers refused to recognize the transfer of Russian authority to the East Germans, and considered the commander of the Soviet forces in East Germany responsible for the obligations which the Soviet Union had assumed by the four-power agreement of 1945 for the occupation of Berlin.

Gen. Lucius D. Clay left Berlin on May 8 after serving for nearly eight months as President Kennedy's personal representative in the city. The general declared on leaving that he had agreed to end his mission because he believed that West Berlin was in no immediate danger from possible Soviet actions. He retained an advisory position as the president's special consultant on Berlin, and he returned to the city for a three-day visit in early July.

Economic Conditions.—The economy of West Berlin has done well since Aug. 13, 1961. Unemployment in 1962 averaged only 11,000 persons, compared with 13,000 in 1961. Before Aug. 13, 1961, 60,000 workers entered West Berlin from East Berlin and adjacent districts in East Germany to work, and 20,000 others came to West Berlin for household and other occasional work. The loss of at least 60,000 workers out of an employed total of 900,000 seemed initially to be a terrific loss to the economy. The industrial labor force of about 340,000 workers was reduced by 27,000, but 4,000 absent workers managed to return after a few days, and by the end of August some 8,000 others were replaced. Labor-saving devices and overtime work enabled a smaller work force to produce somewhat more in July 1962 than in the same month of the previous year.

Industrial production in West Berlin, which depends for the vast majority of its products on West German and Western markets, cannot be maintained without substantial aid from West Germany. In addition to large credits and substantial special gifts, West Berlin receives cash aid equivalent to about $250,000 yearly, and its residents and business enterprises are exempted from paying $100,250,000 in annual taxes that they would pay if they were in West Germany.

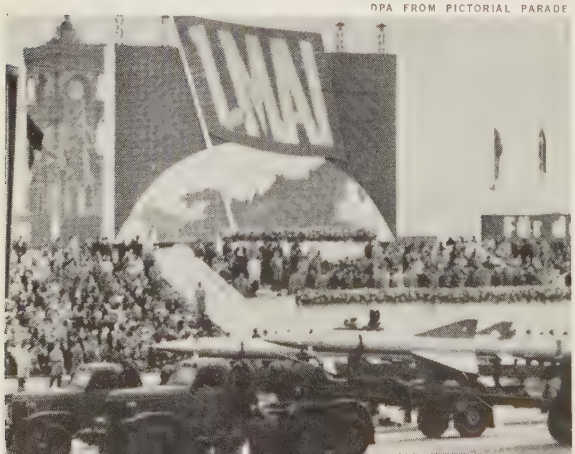
DPA FROM PICTORIAL PARADE



German Democratic Republic (East Germany)

With the erection of the wall in Berlin on Aug. 13, 1961, the last exits from the Democratic Republic to the West were for all practical purposes closed. The East German government has not hesitated to have its military and police forces shoot escapees attempting to pass the frontiers of the republic. In spite of these cruel methods, 13,000 persons managed to escape from the Democratic Republic and East Berlin between Aug. 13, 1961, and Oct. 1, 1962. About 52,000 East Germans visiting West Germany and other Western countries in August 1961 preferred not to return to the East German Republic.

After the closing of the escape hatches the East German government increased political pressure on those groups of experts and intellectuals who were essential for the effective management of the East German economy and the maintenance of cultural life. They were mainly scientists, doctors, engineers, and artists. The relative freedom and material inducements formerly granted to them in order to keep them from fleeing to the West were withdrawn.

The East German regime also introduced, on Jan. 24, 1962, universal conscription. Soldiers were formerly inducted on a voluntary basis, although tremendous pressures were exerted on young persons to make them volunteer for military duty.

The damage done by earlier political acts of the government could not be undone, however. Nearly every fifth inhabitant of the German Democratic Republic has left the republic, particularly young people and professional and highly trained persons.

Economic Conditions.—Although some of the gaps in the labor force were closed by the automatization of some industries, the government admitted that it lacked sufficient experts to undertake a drastic automatization. The announced building of an airplane industry in the Dresden area was abandoned altogether. A governmental program for nuclear research was sharply reduced.

The standard of living seriously declined in the last half of 1961 and in 1962. Grave shortages developed in the supply of food and consumer goods. Reports indicated that even in agricultural districts butter was rationed on a weekly basis of less than 3 ounces, and margarine and other vegetable oils were scarce and of poor quality. Meat was also hard to come by, and milk and eggs were in limited supply. For the first time since the end of the war, the population of East Germany, which formerly produced large potato surpluses, did not receive adequate supplies of potatoes. As a consequence, rationing cards were reintroduced for meat, butter, and potatoes.

The principal reason for the decreased food supplies was the rapid collectivization of agriculture. Many, and perhaps most, of the peasants who were forced into collectives were promised that they would not have to work more than eight hours a day, and they stubbornly insisted on keeping this promise even at planting and harvesting time. Moreover, they concentrated on cultivating the small private plots which they have retained. The fields were in-

adequately attended, and the harvest was not brought in on time. The result has been tremendous waste.

According to an East German government statement of Sept. 18, 1962, a million tons of grain and 5 million tons of potatoes were lacking in 1961, and the shortages had resulted in 1962 in a loss of 2.5 million tons of fodder. The delay of the harvest in 1962 worsened agricultural conditions. According to critical observers in West Berlin, the shortage of fodder caused a decline in meat and milk production in the first six months of 1962 to a level 12% below that of 1961.

The economic policy of the Democratic Republic was revised. It was admitted by the ruling Communist Party that the seven-year economic plan initiated in 1959, which had counted on large annual rates of economic growth, was unrealistic. The government stated that only an annual growth of 6.4% in industrial production, or about half of what the seven-year plan had envisaged, could be realized, but even this may prove to be too optimistic an assumption.

Apart from agricultural difficulties, the government's large expenditures for forced rearmament have proved to be a serious handicap. East Germany does not produce modern arms, which have to be bought from the Soviet Union. Electrical and optical equipment for communications are produced in East Germany and apparently are delivered to the Soviet bloc. In order to expand exports, the greatest emphasis was placed on raising the production of the engineering and optical industry, whose actual output in 1962 reportedly rose by 11–18% over the previous year. No longer is any hope expressed that the production of consumer goods will be raised in the foreseeable future.

The disappointments in economic planning have led to a certain reorganization of technical personnel. East German Communist leader Walter Ulbricht has followed the example of Premier Kadar in Hungary in strengthening the influence of the technicians and expert managers over the ideologists. Herbert Weiz, a director of the Zeiss works in Jena, was named a secretary of state for research and technology, and the position of the chief economic coordinator, Bruno Leuschner, was visibly strengthened.

GERONTOLOGY. See OLD AGE.

GHANA

A republic in western Africa, Ghana is situated on the Gulf of Guinea and bordered by the republics of Ivory Coast, Togo, and Upper Volta. It has an area of 91,863 square miles and a population (est. 1962) of 7,150,000, including Ashanti, Ewe, Fanti, and numerous other tribes and tribal groups. Principal cities and populations (1960 census): Accra, the capital, 337,770; Kumasi, 190,323; Takoradi (with Sekondi), 75,513; Cape Coast, 41,143; and Tamale, 40,327. English is the official language; Fanti, Twi, and Ga are among the major vernacular languages.

Government.—Formed by the union of a British colony (Gold Coast) and a United Nations trust territory (British Togoland), Ghana became a self-governing dominion in the Commonwealth of Nations on March 6, 1957. Following a constitutional plebiscite and a presidential election on April 19 and 26, 1960, Ghana was declared a republic within the Commonwealth on July 1, 1960. Kwame Nkrumah, the nation's first president, combines the functions of head of state and chief executive. Parliament consists of a unicameral National Assembly of 104 members elected directly for 5-year terms and 10 women members specially elected. Number of seats held in the National Assembly (elected July 1956; mandate extended by referendum until July 1, 1965): Convention People's Party (founded by Nkrumah), 100; United Party, 9; vacancies, 5.

Education and Religion.—School enrollment, 1961–62: 875,000 (over 60% of the school-age population). Number of schools, 1961–62: 6,000 primary, 1,600 middle, 68 secondary, 8 technical, 32 teacher-training, 2 higher. Principal religions: almost two thirds animist; 20% Christian, mainly along the coast; 14% Muslim, mainly in the hinterland.

Finance.—Government revenue, 1961–62 est.: £G94,000,000 (£G75,500,000 in 1960–61); expenditure, £G127,700,000 (£G123,300,000 in 1960–61). The Ghanaian pound equals U.S.$2.80. National debt: £G87,800,000 at the end of 1961. Gold and foreign exchange holdings of the Bank of Ghana: £G35,400,000 as of June 30, 1962 (£G37,981,000 on June 30, 1961).

Transportation and Communications.—Transport networks (miles, 1961): railways, 762, with progressive replacement of steam with diesel-oil locomotives; roads (public), 4,792 of which 2,014 are paved. State-owned merchant fleet: 70,000 gross registered tons (May 1962). On Feb. 10, 1962, the £G27 million port at Tema, 17 miles east of Accra, was officially opened. Accra, Winneba, Cape Coast, and Keta ceased operations as ports of entry and have been declared "sufferance ports" to be used only in emergencies. National airline: Ghana Airways; the international airfield at Accra is used by 13 foreign airlines. Other communications data, 1961: passenger cars, 23,439; trucks, 17,235; buses, 3,237; radio receivers, 160,000; telephones, 25,488. A "Voice of Ghana" transmitting station was inaugurated on Oct. 27, 1961.

Economic Indicators.—Gross national product was £G580.4 million in 1961 (current prices), up 9% from 1960. Index of agricultural production (1952–54 = 100): 148 in 1960 (129 in 1959); cost-of-living index (1953 = 100): 121 in 1961 (113 in 1960). In 1961 the labor force totaled over 3,000,000, of which 70% were in farming, herding, fishing, and forestry. Total wage earners at the end of 1960: 332,898.

Manufactures and Minerals.—Chief products, 1961: gold, 833,500 fine troy ounces (down 5.2% from 1960); diamonds, 3,213,600 carats (down 2.1%); manganese ore, 431,500 tons (down 20.8%); bauxite ore, 200,800 tons (up 5.4%); electric power, 389.6 million kw.-hr. (up 4.3%).

Agriculture and Forestry.—Agricultural land accounts for 22% of total area. Chief crops (tons), 1960: cocoa, 432,243 in 1960–61 (317,000 in 1959–60), 30% of world supply, providing livelihood for one-third of Ghana's population; sorghum and millet, 220,000 (207,000 in 1959); plantains, 1,500,000 (1,500,000); corn, 191,000 (191,000); logs, 64.8 million cubic feet (62 million); sawn timber, 13.3 million cubic feet (11.4 million in 1959).

Foreign Trade.—Total exports, 1961: £G114 million (down less than 1% from 1960); imports, £G140.7 million (up 9%). Principal exports (in £G million, 1961): cocoa, 69.3 (66.4 in 1960); gold, 10.1 (11.0); diamonds, 7.2 (9.8); manganese, 5.8 (6.4); wood, 14.9 (15.9). Principal imports (in £G million, 1961); manufactured goods, 57.8; machinery and transportation equipment, 33.2; food and live animals, 24.9; chemicals, 10; mineral fuels and lubricants, 6.4; beverages and tobacco, 3.6. Chief customers (with percentage of total Ghanaian exports, 1961): Great Britain (28.9%); United States (23.6%); Netherlands (12%). Principal suppliers (with percentage of total Ghanaian imports, 1961): Great Britain (36.8%); United States (8.3%); Japan (7.9%); Netherlands (7.9%); West Germany (7.6%); Sino-Soviet bloc (4.6%).

Events, 1962.—Ghana's most ambitious economic development project—the harnessing of the Volta River for hydroelectric power and for the smelting of aluminum—was officially launched on January 23, following the signing of the Volta River Project Master Agreement by President Nkrumah and Edgar Kaiser, representing the Volta Aluminum Company (Valco). Previously, on Dec. 16, 1961, the United States government announced the loan of $37 million for construction of the Akosombo Dam and the adjoining power station and grid lines, and a $54 million investment guarantee to Kaiser and Reynolds covering their investment in Valco. The United States government also approved a loan of up to $110 million to Valco for the construction of an aluminum smelter. On Feb. 8, 1962, the World Bank announced a $47 million loan to the Volta project, which will cost a total of $324 million and take five years to complete.

During 1962, Ghana's economy was characterized by continued substantial excessive buying demand over productive capacity, resulting in rising prices and a balance of payments deficit. Although cocoa production was at record level, foreign exhange earnings showed no significant increase because of low world cocoa prices. In an effort to reverse the deficit payments position, Ghana borrowed £G5 million from the International Monetary Fund on August 17.

On January 25 the government announced the suspension of the second 5-year plan; a new 7-year plan was being drawn up in 1962 and was scheduled to come into effect on Jan. 1, 1963. On May 8, Ghana signed an agreement with the United States for the survey of a Ghana investment bank. On October 2, President Nkrumah expressed his appreciation for the completed survey and singled out the United States for appreciative

remarks for economic assistance rendered. Military cooperation with Great Britain was continued with the signing, on May 1, of an agreement for a training mission consisting primarily of naval and air elements to assist in the development of the Ghanaian armed forces.

Friendly relations with the Sino-Soviet bloc continued to expand during 1962. On February 1 the Soviet Union and Ghana exchanged ratifications of an agreement to build a 540-mile railroad from Kumasi to Ouagadougou, the capital of Upper Volta. On March 28, ratifications were exchanged with Communist China for trade, technical assistance, and cultural cooperation. On June 1 it was announced that a Ghana State Farms Corporation would be established, with Soviet aid, to set up state-owned farms.

The easing of the internal political situation, evident at the beginning of 1962 with the release of several hundred persons detained under the 1958 Preventive Detention Act and the declaration of a general amnesty for political exiles, was sharply reversed with the outbreak of terroristic attacks on President Nkrumah. On August 1, a grenade was thrown at Nkrumah in Kulungugu, near the Ghana–Upper Volta border, resulting in slight injury to the president, the killing of 4 bystanders, and the injuring of 56 others. Other bomb attacks in September resulted in 15 dead and more than 250 injured. Many hundreds were arrested, including Ako Adjei, minister of foreign affairs, Tawia Adamafio, minister of information, and H. H. Cofie-Crabbe, executive secretary of the Convention People's Party. A state of emergency was declared on September 22, accompanied with a curfew and press censorship. On October 17 the curfew was lifted.

On August 13, Richard Roseveare, Anglican bishop of Accra, was expelled from Ghana for criticizing as "godless" the Young Pioneers Movement, the youth arm of the Convention People's Party. He was allowed to return on November 7.

In a speech before the National Assembly on October 2, Kwame Nkrumah rejected the Parliament's offer (passed on September 7) of a lifetime presidency. Among the highlights of his speech were the reassertions that Ghana would become a one-party state, private property would be guaranteed against expropriation, and the budget would be more pragmatic, involving a more equitable distribution of the burden of taxation.

In the area of foreign affairs, Ghana's relations with Niger, Ivory Coast, and Cameroun improved during 1962. A series of misunderstandings between Ghana and Nigeria arose in June, however, leading to sharp exchanges. Nigerian leaders accused Ghana of carrying out subversive activities in their country, a charge that Ghana vehemently denied. Ghana was the host to several international conferences during 1962, including All-Africa Farmers' Conference in March, the African Freedom Fighters' Conference in early June, and a World Without the Bomb Conference at the end of June. On July 2, President Nkrumah received the 1961 Lenin Peace Prize.

GIBRALTAR

Comprising a peninsula extending southward from Spain and commanding the western entrance to the Mediterranean Sea, Gibraltar is the smallest of Britain's crown colonies (area, 2¼ square miles). It consists primarily of a long mountain called the Rock of Gibraltar (1,408 feet above sea level), and has a deep harbor of 440 acres at its base. The civilian population (1961 census) totals 24,075.

The governor of the colony and commander in chief of the military installations (since 1955 a subcommand of the North Atlantic Treaty Organization) is Gen. Sir Dudley Wood, who succeeded Gen. Sir Charles F. Keightly in August 1962. The governor is assisted by an 8-member Executive Council and a 12-member Legislative Council, 7 of whom are elected. Government revenue in 1961 totaled £2,144,963; expenditure, £2,134,460. In 1961 there were 16 kindergarten and primary schools (with 2,812 pupils), and 8 secondary schools (1,816 pupils).

The economy of the colony revolves around the port and the naval and air force base. Manufactured products include tobacco, roasted coffee, ice, mineral water, candy, and canned fish and fruit. In addition to 6,000 British workers, the labor force in 1961 included 7,774 men and 3,133 women who commuted between Spain and Gibraltar. Exports (including re-exports) in 1961 were valued at £4,841,810; imports, £13,176,622, principally from Great Britain. The tourist industry served 413,276 visitors in 1961.

GOLD

World production of gold in 1961 rose (for the eighth consecutive year) to a record 47,700,000 fine (troy) ounces, valued at $1.7 billion, according to the U.S. Bureau of Mines. The increase of 2.7 million ounces exceeded the 1960 increase (2.3 million), and was again attributed to expansion in South Africa and an estimated gain in the USSR.

United States output of gold totaled 1,548,270 fine ounces in 1961, compared with 1,666,772 in 1960, a loss of 7%. South Dakota (leading by a large margin) and Utah provided nearly 60% of total domestic output. The Homestake mine in South Dakota contributed more than one third of the national gold production. Much of the domestic gold (39% in 1961, compared with 35% in 1960) is recovered as a byproduct of base metals.

In the first nine months of 1962, United States gold output was about 1,116,538 ounces, compared with 1,138,162 ounces in the same period of 1961.

A record outflow of gold valued at $775 million was the salient feature in United States foreign trade in 1961. President Eisenhower's order prohibiting American citizens from holding gold abroad, and President Kennedy's statement that the official price would be maintained contributed to price stability in the London gold market.

Canada.—In the first half of 1962, gold output totaled 2,097,000 ounces, compared with 2,270,000 in the first half of 1961. Production in the year 1961 totaled 4,425,000 ounces.

South Africa.—In the first nine months of 1962, gold output was 18,898,681 ounces, against 17,065,213 ounces in the 1961 period. Production in the year 1961 totaled 22,946,294 ounces.

(For gold production in other countries, see MINERAL PRODUCTION.)

GOLDBERG, Arthur Joseph

U.S. Supreme Court justice: b. Chicago, Ill., Aug. 8, 1908.

Graduating from Northwestern University Law School in 1929, Arthur Goldberg was associated with several Chicago law firms, where he built up a reputation as a skillful lawyer in handling equity and corporate issues. He established his private practice in 1933, and by 1938 had begun to specialize in labor law. In World War II he served as assistant to the director of the Office of Strategic Services (1942–43), and undertook several overseas missions to help organize an underground intelligence network among European workers. In 1948 he was appointed general counsel of the Congress of Industrial Organizations (CIO) and of the United Steelworkers of America. He played a significant role in the institution of pension and insurance plans in the steel industry, and in the trials which led to the expulsion of Communist-dominated unions from the CIO.

In 1955 he helped to work out the complex details of the merger of the American Federation of Labor and the CIO, and became the special counsel of the united labor federation. He formulated the Code of Ethical Standards for labor unions, and played a key role in the AFL-CIO's expulsion in 1957 of certain members accused of corruption and malpractices.

Sworn in as President Kennedy's secretary of labor on Jan. 21, 1961, Goldberg departed from tradition with his personal participation during 1961 in the settlement of a number of major labor-management disputes. The president appointed him to the Advisory Committee on Labor-Management Policy and the Committee on Equal Employment Opportunity.

Secretary of Labor Goldberg continued his active mediatory role in 1962. He mediated a Studebaker-Packard Corporation–United Auto Workers strike in Washington, D.C., and a new 3-year contract was announced on February 8. Addressing the Executive Club in Chicago on February 23, he asserted that the government must "give more help in the collective bargaining process," and must "increasingly provide guidelines" to ensure that settlements are "in the public interest." His efforts to settle a west coast maritime strike in March failed, but he worked with President Kennedy to help bring the steel industry negotiations to a new, "noninflationary," two-year contract, which was signed on April 6. (See also IRON AND STEEL; LABOR.)

On Aug. 29, 1962, when Felix Frankfurter had retired from the U.S. Supreme Court, President Kennedy nominated Goldberg as Frankfurter's successor, recommending him for his "scholarly approach to the law, combined with his deep understanding of our economic and political system." On September 25 the Senate confirmed Goldberg's nomination, and when the fall term of the court opened on October 1, he was sworn in as the 94th justice in the court's history.

GRAINS

Reduced acreage resulting from United States government programs held grain production in 1962 below the record levels of recent years. The use of grain continued to increase, and stocks carried over from previous crops were reduced. This was the first significant decrease in the nation's grain surpluses in a decade.

Production of the four feed grains in 1962—corn, oats, barley, and sorghum—totaled 143,093,000 tons, compared with 140,626,000 the preceding year, and well below the record 155,618,000 tons of 1960, according to the Statistical Reporting Service of the U.S. Department of Agriculture. The reduced production of the last two years resulted from government programs under which farmers received payments for diverting land from production of feed grains to soil-conserving uses. About 31 million acres were diverted from corn, oats, and barley under the 1962 program. This was about 6 million acres more than under the 1961 program, which did not include barley. However, record yields for each of the four grains in 1962 resulted in higher production than in 1961.

National average price support rates for feed grains produced in 1962 were $1.20 per bushel for corn, 93¢ per bushel for barley, $1.91 per cwt. for sorghum grain, 62¢ per bushel for oats, and $1.02 per bushel for rye. A feed grain program for 1963, similar to those of the two previous years, was provided in the Food and Agriculture Act of 1962.

In addition to the 1962 crops, the feed grain supply included 71 million tons of grain carried over from preceding years. This was 14 million tons less than the record carry-over of 1961, and the first reduction in stocks since 1952. The carry-over included (1961 figures in parentheses): corn, 1,613 million bushels (2,008 million); sorghum grain, 658 million bushels (702 million); oats, 277 million bushels (325 million); and barley, 123 million bushels (153 million).

The use of feed grains has been increasing steadily, reaching a record 155 million tons in 1961–62. This was 9 million tons more than in 1960–61, and 40 million more than five years earlier.

Food grain production—wheat, rye, rice, and buckwheat—dropped for the second consecutive year in 1962. The total was 37,147,000 tons, compared with 40,542,000 in 1961 and 44,392,000 in 1960. The decline from 1961 resulted mainly from lower production of wheat—by far the leading food grain—caused by reduced acreage allotments and voluntary diversion of land under the 1962 wheat program, coupled with heavy acreage losses in winter wheat. Support prices for the 1962 wheat crop were at a national average rate of $2 per bushel, and conservation payments were made for land taken out of production.

The carry-over of wheat on July 1, 1962, totaled 1,304 million bushels, 107 million less than the record set a year earlier. Wheat production exceeded use during most of the years from 1951 to 1961, and heavy surpluses accumulated. The drop in stocks from 1961 to 1962 was due mainly to smaller production, coupled with record exports of 718 million bushels. Prospects for supply and use for 1962–63 indicated the likelihood of a further drop in the carry-over by July 1, 1963.

Wheat.—The 1962 United States crop of 1,091,787,000 bushels was 12% less than that of 1961, and the smallest since 1957. Farmers planted 49,100,000 acres to the crop, the smallest acreage on record (going back to 1919), and harvested 43,545,000 acres, the least since 1934. Yields per acre averaged 25.1 bushels, 1.1 bushels more than in 1961, and the third highest on record.

The 1962 crop included 816,379,000 bushels of winter wheat and 275,408,000 of spring wheat. Included in the spring wheat total were 71,809,000 bushels of durum wheat. This was the largest durum crop since 1928, and more than three times the 1961 output of 21,185,000 bushels. Durum wheat, which is used in making macaroni and spaghetti products, had been in short supply.

World wheat production in 1962 rose 7% over 1961 to 8,390 million bushels, second only to the 1958 record crop of 8,700 million.

Rye.—Production in the United States increased sharply in 1962. The crop of 41,175,000 bushels was 50% larger than that of 1961 and the largest in 20 years. Acreage harvested for grain increased 30% over 1961 to 2,014,000, and yield per acre rose 15% to 20.4 bushels.

WORLD PRODUCTION OF GRAINS BY LEADING COUNTRIES

[1] Preliminary estimates for Northern Hemisphere countries; for Southern Hemisphere countries, preliminary forecasts based largely on acreage and weather conditions. Years shown refer to years of harvest in Northern Hemisphere. Harvests in Southern Hemisphere occur in early part of following year. [2] Figures are in thousand metric tons and exclude Communist areas. (Source: Foreign Agricultural Service, U.S. Department of Agriculture.)

A world crop of 1,350 million bushels was produced in 1962, slightly above 1961, but below the 1955–59 average of 1,440 million.

Rice.—A record United States crop of 64,458,000 bags (100 pounds each) of rough rice was produced in 1962, 19% more than a year earlier. Yields averaged a record 3,653 pounds per acre, 242 pounds more than in 1962, while the acreage harvested rose to 1,764,000 from the 1,588,900 of 1961.

World production, excluding Communist countries, also reached a new high. The 1962–63 crop was estimated at 153,191,800 metric tons, compared with 150,397,800 in 1961–62.

Buckwheat.—Production in the United States continued its 14-year downtrend, dropping to 729,000 bushels in 1962, only 35% of the 1951–60 average. Production in 1961 was 864,000 bushels.

Corn.—American farmers harvested corn from the smallest acreage since records were begun in 1919—56,842,000 acres—but yields rose to a record 64.1 bushels per acre, 2.1 bushels more than in 1961. Production of grain totaled 3,644 million bushels, slightly more than in 1961 and above the 1951–60 average of 3,128 million bushels. In addition to grain, 74,046,000 tons of silage were produced in 1962, and 1,569,000 acres planted to corn were used for forage.

World corn production in 1962–63 fell slightly below the preceding year to 7,310 million bushels, but was above the 1955–59 average of 6,465 million.

Oats.—The United States crop of 1962 was 1,031,743,000 bushels, 2% more than in 1961, but otherwise the smallest since 1939. Yields set a record of 45 bushels per acre, compared with 42.2 in 1961, but the 22,934,000 acres harvested was the least since 1884.

World production fell to the lowest level in 40 years —3,720 million bushels—as acreage continued its downward trend.

Barley.—The 1962 crop in the United States rose 9% from 1961 and 17% from average, to 429,495,000 bushels. The 12,443,000 acres harvested in 1962 fell 4% below 1961, but the average yield per acre rose nearly 4 bushels, to a record 34.5.

A new world record was set in 1962–63 when production reached 3,720 million bushels, 310 million more than a year earlier.

Sorghum Grain.—United States yields set a new record for the sixth consecutive year in 1962, reaching 44.1 bushels per acre. The acreage harvested rose 5% over 1961, to 11,547,000. The 1962 crop of 509,137,000 bushels was 6% more than in 1961, but 18% below the 1960 record.

GREAT BRITAIN

The United Kingdom of Great Britain and Northern Ireland (area, 94,516 square miles) is an island group lying off the northwest coast of Europe, bounded on the south by the English Channel, on the north and west by the Atlantic Ocean, and on the east by the North Sea. England (50,327 square miles), Wales (8,017 square miles), and Scotland (30,411 square miles) form Great Britain, the largest island; the remainder consists of Northern Ireland (5,459 square miles), the Isle of Man (227 square miles), the Channel Islands (75 square miles), and about 500 smaller islands.

Population.—At the census of April 23, 1961, the population of the United Kingdom totaled 52,834,249 (preliminary figures), including 46,071,604 in England and Wales, 5,178,490 in Scotland, 1,425,462 in Northern Ireland, 110,543 in the Channel Islands, and 48,150 in the Isle of Man; in mid-1961 it was estimated at 53,082,000. The census population of Greater London was 8,171,902 (County of London, 3,195,114; Outer Ring, 4,976,788), and those of other principal cities were as follows: Birmingham, 1,105,651; Glasgow, 1,054,913; Liverpool, 747,490; Manchester, 661,041; Leeds, 510,597; and Sheffield, 493,954. In addition to London, Liverpool, Manchester, and

Glasgow, the chief ports are Bristol, 436,440; Belfast, 416,094; Hull, 303,268; Newcastle-upon-Tyne, 269,389; Cardiff, 256,270; and Southampton, 204,707.

Government.—The United Kingdom is a constitutional monarchy, with its executive drawn from Parliament. Queen Elizabeth II (acceded Feb. 6, 1952) is sovereign. Charles, elder son of the queen and her husband, Philip, Duke of Edinburgh, is Prince of Wales and heir apparent.

The House of Lords, upper house of the bicameral Parliament and chiefly a revisionary body, consisted in August 1962 of 923 members, including, in addition to 4 peers of the blood royal, 2 archbishops and 24 bishops of the Church of England, 22 dukes, 26 marquesses, 136 earls, 111 viscounts, 592 barons and baronesses, and 16 representative Scottish peers. Included in the House of Lords are a number of judges given life peerages to enable the House to function as the final court of appeal. Eight peers were minors, who could not sit until of age.

The strengths of the parties in the lower house, the House of Commons, after the general election of Oct. 8, 1959, were as follows: Conservatives and their supporters, 365; Labour and Cooperative Party members, 258; Liberals, 6; and independents, 1. In 40 by-elections to Dec. 1, 1962, the Conservatives gained 2 seats from, and lost 3 to, Labour, and the Liberals gained 1 from the Conservatives; 1 by-election was pending. One Labour member became an independent on March 22, 1961.

The leading members of the government in December 1962 were Harold Macmillan (q.v.), prime minister; Reginald Maudling (appointed July 13, 1962), chancellor of the exchequer; the Earl of Home (q.v.), foreign secretary; Henry Brooke (appointed July 13), home secretary; Peter Thorneycroft (appointed July 13), minister of defense; and Duncan Sandys (appointed July 13), who was already secretary of state for Commonwealth relations, colonial secretary. Richard Austen Butler, previously home secretary, was appointed to a new post, first secretary of state, on July 13.

Finance.—Revenue in the financial year 1961–62 amounted to £6,645 million, and expenditure to £6,235 million, giving a surplus of £410 million (£1 equals U.S.$2.80). In the 1962–63 budget revenue was estimated at £6,807 million, and expenditure at £6,364 million, giving a surplus of £443 million. Defense expenditure was estimated at £1,721 million; expenditure on local government, housing, and social services, at £2,290 million; that on agriculture, at £401 million; on industry, trade, and transport, at £449 million; and interest on the national debt, at £600 million.

Britain's balance of payments in 1961 showed a marked improvement on 1960, and the improvement was continued in the first half of 1962. The current account in 1961 showed a deficit of £70 million, compared with a deficit of £288 million in 1960. The surplus on the long-term capital account was £8 million, representing a rise of £210 million compared with 1960. In the first half of 1962 there was a surplus on the current account of £96 million, the first half-yearly surplus since 1959. Long-term capital movements showed an outflow of £41 million, but items in the invisible account (banking, shipping, and the like), showed a surplus of £112 million, while foreign holdings of sterling fell by £194 million, and the gap between exports and imports declined to £16 million. By July 31, Britain repaid all of the $1,500 million received from the International Monetary Fund (IMF) on Aug. 4, 1961.

On Dec. 31, 1961, the sterling area's gold and dollar reserves stood at £1,185 million; by Sept. 30, 1962, they had fallen to £997 million, but by November 30 they had risen to £1,030 million. On March 8, 1962, the bank rate, which had stood at 6% since Nov. 2, 1961, was lowered to 5½%; it was lowered to 5% on March 22, and to 4½% on April 26.

Taxation.—The standard rate of income tax for both individuals and corporations in the financial year 1962–63 remained at 38¾%. Individuals can deduct two ninths of the first £4,005 earned and one ninth of the balance up to £9,945 in calculating taxable income. Exemptions of £140 for single persons, £240 for married couples, and £100 to £150 for children, according to age, are allowed, as are deductions for dependent relatives, widows' or widowers' housekeepers, and persons over 65 years of age. The tax rate varies from 8¾% on the first £60 of taxable income to the standard rate on taxable income over £360.

Queen Elizabeth of Great Britain and her youngest child, Prince Andrew, age two, are seen in the garden of Windsor Castle.

WIDE WORLD

Surtax varies from 10% on unearned income over £2,000 (on earned income over £5,000) to 50% on income over £15,000. Corporations pay a profits tax of 15% on profits over £2,000, but an abatement is allowed if profits are less than £12,000. Among other taxes are purchase tax at rates of from 5 to 50% of the wholesale value, estate duty, and customs and excise duties.

Defense.—The basic objectives of Britain's defense policy in the next five years were outlined in the annual defense white paper published on Feb. 20, 1962. This policy was to be based on continuing support of the North Atlantic Treaty Organization (NATO) as a primary responsibility; a continuance of Britain's own contribution to the Western deterrent in the form of nuclear capability; the need to create more flexible and mobile units out of Britain's new all-professional forces; and the acceptance of the principle of joint task forces outside Europe. Defense expenditure in 1962–63 was estimated at £1,721 million, representing 7% of the gross national product, and £65 million higher than in 1961–62. In 1962 about 85% of the Royal Navy's active and operational reserve fleet, over 50% of the front-line aircraft of the Royal Air Force (RAF), and 40% of all army formations were assigned to NATO. Britain's forces in West Germany totaled 45,000 to 55,000 men.

By the end of 1962 all men called up under compulsory military service, which commenced in 1939 and has now ceased, were to have left the armed forces. The estimated strengths of the forces on April 1, 1962, were as follows: army, 200,600; Royal Navy, 94,600; and RAF, 148,200; for a total of 443,400, including 16,200 women.

In 1962–63 the operational strength of the Royal Navy consisted of 3 aircraft carriers, 2 commando ships, 4 cruisers, 2 guided missile destroyers, 20 other destroyers, 32 frigates, 2 dispatch vessels, 1 ice patrol ship, 30 submarines, 37 minesweepers, and 7 amphibious warfare vessels, for a total of 140 ships. In addition, 37 ships were on trials and training; there were 71 fleet support and auxiliary vessels; and 296 ships were either being refitted or modernized, or were in reserve.

Atomic Energy.—Atomic research and development has been the responsibility of the United Kingdom Atomic Energy Authority (UKAEA) since Aug. 1, 1954. The UKAEA's estimated expenditure in 1962–63 was £67,850,000, or £10 million less than in 1961–62. The authority's capital assets were valued at £560 million on March 31, 1962. Commercial sales in 1961–62 amounted to over £20 million, including £10 million from fuel elements for power stations, £6 million from electricity, and £1.4 million from isotopes.

Britain's first purely commercial nuclear power station, built by the Central Electricity Generating Board (CEGB) at Berkeley, Gloucestershire (total output, 275,000 kilowatts), began feeding electricity into the national electricity grid system on June 15, 1962. The CEGB station at

Bradwell, Essex (capacity, 300,000 kilowatts), was expected to be in operation by the end of the year. Six more stations were being built by the CEGB at Hinkley Point, Somerset (500,000 kilowatts), Trawsfynydd, Merionethshire (500,000 kilowatts), Dungeness, Kent (550,000 kilowatts), Sizewell, Suffolk (580,000 kilowatts), Oldbury, Gloucestershire (550,000 kilowatts), and Wylfa Head, Anglesey (800,000 kilowatts), under a nuclear power program to be completed in 1968. Application has been made to build a second station, with a capacity of 1,000,000 kilowatts, at Hinkley Point. The South of Scotland Electricity Board was building a nuclear power station at Hunterston, Ayrshire, due to start operating in 1963.

Education.—Expenditure on education from central government funds in 1962–63 was estimated at £137 million. The bulk of educational expenditure is from local authority funds; in 1960–61 it totaled £704,554,000 in England and Wales and £87,174,000 in Scotland.

In 1962 there were 24 universities in the United Kingdom (18 in England, 4 in Scotland, 1 in Wales, and 1 in Northern Ireland). University income in 1960–61 amounted to £67,467,000, of which £49,037,000 came from parliamentary grants and £1,327,000 from local authorities. At the beginning of the academic year 1961–62 there were 111,385 full-time university students, including over 6,000 from the Commonwealth and over 4,000 from foreign countries. More than 80% of the total are aided by scholarships.

There were 7,657,566 children and 318,120 full-time teachers in schools in England and Wales, 906,922 children and 38,327 teachers in Scottish schools, and 282,928 children in schools in Northern Ireland in January 1961. In the school year 1960–61 there were 481,783 part-time students in England and Wales and 261,439 in Scotland.

Religion.—The Church of England, organized into the provinces of Canterbury (29 dioceses) and York (14 dioceses), each under an archbishop, is the established church. Baptized membership in the Church of England in 1961 was estimated at 27,000,000. The Episcopal Church in Scotland had 108,000 members in 1961; the Church in Wales (disestablished in 1920), 200,000 members; and the Church of Ireland (disestablished in 1869), 354,000 members.

The established (Presbyterian) Church of Scotland had an estimated membership of 1,307,000 in 1961. Methodists numbered 728,600; Congregationalists, 211,300; and Baptists, 321,000. Roman Catholics were estimated at 5,000,000, and the Jewish community at 450,000.

Social Services.—The estimated cost of social and community services from central government funds in 1962–63 was £2,290 million.

On Oct. 1, 1961, there were 46,263,297 persons registered under the National Health Service in England and Wales, and there were 22,058 doctors providing general medical services in England and Wales and 2,864 in Scotland. Dentists in the service in Great Britain numbered 17,667, and there were 7,180 opticians in England and Wales. On March 31, 1962, there were 541,600 staffed hospital beds in Great Britain; full-time nursing staff on Sept. 30, 1961, totaled 176,011. In 1961, 225,988,000 prescriptions were dispensed under the health service in Great Britain.

In May 1962, family allowances were being paid to 3,625,000 families in respect of 9,525,000 children. On June 30, there were 5,725,000 retirement pensioners, 122,000 noncontributory old age pensioners, 588,000 widows receiving pensions or allowances, and 1,863,000 persons receiving National Assistance grants. Claims for unemployment benefits averaged 185,000 a week in 1961–62, and new claims for sickness benefits and injury benefits averaged 176,000 and 16,000, respectively.

Agriculture.—Agricultural production rose slightly in 1960–61 over the previous year, the increase being spread fairly evenly over the whole range of agricultural products. A similarly evenly spread rise took place in 1961–62, except for the output of sugar beets and potatoes, which suffered from a prolonged cold spell in the summer of 1962. Acreage and production figures are shown in Table 1.

Table 1—AGRICULTURAL PRODUCTION
(Years beginning June 1)

Crop	1960–61	1961–62
Acreages (thousands):		
Wheat and rye	2,121	1,846
Other grains	5,548	5,697
Potatoes	829	701
Sugar beets	436	427
All tillage	11,182	10,858
Production (thousand long tons):		
Wheat and rye	3,010	2,597
Other grains	6,518	6,964
Potatoes	7,158	6,196
Sugar beets	7,215	5,936
Milk (million gallons)	2,460	2,566
Eggs[1]	725	759
Beef and veal	772	865
Mutton and lamb	243	267
Pig meat[1]	687	745
Net agricultural output (1936–1939 = 100)	178	183

[1] Includes estimated production from units of under 1 acre.

Minerals.—Coal production totaled 190,476,000 long tons in 1961 and 126,773,000 tons in the first 8 months of 1962. Output per man-shift rose to 4.18 tons at the coal face and 1.45 tons overall in 1961, and was running slightly higher in 1962. In August 1962, 547,000 persons were employed in the industry. Iron ore production totaled 16,536,000 long tons in 1961 and 8,903,000 tons in the first 7 months of 1962. British refineries processed 49,105,200 long tons of crude and shale oil in 1961 and 29,318,300 tons in the first 7 months of 1962.
